

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

THE
NEW ENCYCLOPÆDIA;
OR,
UNIVERSAL DICTIONARY
OF
ARTS AND SCIENCES.

IN WHICH

The different Sciences and Arts are digested into the Form of distinct Treatises or Systems;

Including the

LATEST DISCOVERIES AND IMPROVEMENTS;

WITH THE NATURAL, CIVIL, MILITARY, AND COMMERCIAL HISTORY, AND BIOGRAPHY OF EMINENT MEN,

OF ALL NATIONS;

A DESCRIPTION OF

ALL THE COUNTRIES, CITIES, SEAS, RIVERS, &c. OF THE KNOWN WORLD.

Including also

THE WHOLE OF DR. JOHNSON'S

DICTIONARY OF THE ENGLISH LANGUAGE.

COMPILED FROM EVERY SOURCE OF DOMESTIC AND FOREIGN LITERATURE; AND ILLUSTRATED WITH
UPWARDS OF THREE HUNDRED AND FORTY PLATES,

AND A COMPLETE AND ACCURATE ATLAS.

IN TWENTY THREE VOLUMES.

VOL. X.

FOUNDERY.

At the conclusion of our last Volume; (see page 718,) we inserted this word in its proper order, with its different definitions, but had not sufficient room remaining in that volume to insert the various branches of this art, in the complete manner, which an article of such importance required.

1. FOUNDRY OF BELLS. The metal, it is to be observed, is different for bells from what is for statues; there being no tin in the latter; but there is a 5th, and sometimes more, in the bell-metal. The dimensions of the core and the wax for bells, if a ring of bells especially, are not left to chance, but must be measured on a scale, or diapason, which gives the height, aperture, and thickness, necessary for the several tones required. It is on the wax that the several mouldings and other ornaments and inscriptions, to be represented in relief on the outside of the bell, are formed. The clapper or tongue is not properly a part of the bell, but is furnished from other hands. In Europe, it is usually of iron, with a large knob at the extremity; and is suspended in the middle of the bell. In China, it is only a huge wooden mallet, struck by force of arm against the bell; whence they can have but little of that consonance so much admired in some of our rings of bells. The Chinese have an extraordinary way of increasing the sound of their bells; viz. by leaving a hole like the cannon; which our bell founders would reckon a defect. The proportions of our bells differ very much from those of the Chinese, as well as their sizes. See BELL, N° I, § 5. In ours, the modern proportions are, to make the diameter 15 times the thickness of the brim, and the height 12 times. The parts of a bell are, 1. The sounding bow, terminated by an inferior circle, which grows thinner and thinner. 2. The brim or that part of a bell whereon the clapper strikes, and which is thicker than the rest. 3. The outward sinking of the middle of the bell, or the point under which it grows wider to the brim. 4. The waist or furniture, and the part that grows wider and thicker quite to the brim. 5. The upper vase, or that part which is above the waist. 6. The pallet which supports the staple of the clapper within. 7. The bent and hollow branches

VOL. X. PART I.

F O U

of metal uniting with the cannons, to receive the iron keys, whereby the bell is hung up to the beam which is its support and counterpoise, when rung out. The business of bell-foundry is reducible to three particulars. 1. The proportion of a bell. 2. The forming of the mould. And, 3. The melting of the metal. There are two kinds of proportions, viz. the simple and the relative; the former are those proportions only that are between the several parts of a bell to render it sonorous; the relative proportions establish a requisite harmony between several bells. The method of forming the profile of a bell, previous to its being cast, in which the proportion of the several parts may be seen, is as follows: the thickness of the brim, C_1 , Plate CLV. fig. 12. is the foundation of every other measure, and is divided into three equal parts. First, draw the line HD, which represents the diameter of the bell; bisect it in F, and erect the perpendicular Ff; let DF and HF be also bisected in E and G, and two other perpendiculars Ee, Gg, be erected at E and G. GE will be the diameter of the top or upper vase, i. e. the diameter of the top will be half that of the bell; and it will, therefore, be the diameter of a bell which will sound an octave to the other. Divide the diameter of the bell, or the line HD, into 15 equal parts, and one of these will give C the thickness of the brim; divide again each of these 15 equal parts into three other equal parts and then form a scale. From this scale take 12 of the larger divisions or two 15ths of the whole scale in the compass, and setting one leg in D describe an arc to cut the line Ee in N; draw ND, and divide this line into 12 equal parts; at the point 1 erect the perpendicular 1C = 10, and C_1 will be the thickness of the brim = one 15th of the diameter: draw the line CD: bisect DN; and at the point of the bisection 6 erect the perpendicular 6K = $1\frac{1}{2}$ of the larger divisions on the scale. With an opening of the compass equal to twice the length of the scale or 30 brims, setting one leg in N, describe an arc of a circle, and with the same leg in K and the same opening, describe another arc to intersect the former: on this point of intersection as a centre, and with a radius equal to 30 brims, describe the arc NK; in 6K produce take KB = $\frac{1}{3}$ of the larger measure of the scale $\frac{1}{4}$ of the brim, and on the same centre with

A

ra

radius 30 $\frac{1}{2}$ brims describe an arc AB parallel to NK. For the arc BC, take 12 divisions of the scale or 12 brims in the compass; find a centre, and from that centre, with this opening, describe the arc BC, in the same manner as NK or AB were described. There are various ways of describing the arc Kp; some describe it on a centre at the distance of nine brims from the points p and K; others, as it is done in the figure, on a centre at the distance only of seven brims from those points. But it is necessary first to find the point p, and to determine the rounding of the bell p r. For this purpose, on the point C as a centre, and with the radius C r, describe the arc r p n; bisect the part r, n, of the line D n, and erecting the perpendicular p m, this perpendicular will cut the arc r p n in m, which terminates the rounding r p. Some founders make the bendings K a third of a brim lower than the middle of the line DN; others make the part C r D more acute, and instead of making C r perpendicular to DN at r, draw it one 6th of a brim higher, making it still equal to one brim; so that the line r D is longer than the brim C r. In order to trace out the top part Nn, take in the compass eight divisions of the scale or 8 brims, and on the points N and D as centres, describe arcs to intersect each other in 8: on this point 8, with a radius of eight brims, describe the arc Nb; this arc will be the exterior curve of the top or crown: on the same point 8 as a centre, and with a radius equal to 7 $\frac{1}{2}$ brims, describe the arc A c; and this will be the interior curve of the crown; and its whole thickness will be one third of the brim. As the point 8 does not fall in the axis of the bell, a centre M may be found in the axis by describing, with the interval of 8 brims on the centres D and H, arcs which will intersect in M; and this point may be made the centre of the inner and outer curves of the crown as before. The thickness of the cap, which strengthens the crown at Q, is about one third of the thickness of the brim; and the hollow branches or ears about one sixth of the diameter of the bell. The height of the bell is in proportion to its diameter as 12 to 15; or in the proportion of the fundamental sound to its third major: whence it follows that the sound of a bell is principally composed of the sound of its extremity or brim, as a fundamental of the sound of the crown which is an octave to it, and of that of the height which is a third. The particulars necessary for making the mould of a bell are, 1. The earth: the most cohesive is the best; it must be well ground and sifted, to prevent any chinks. 2. Brick stone; which must be used for the mine, mould, or core, and for the furnace. 3. Horse-dung, hair, and hemp, mixed with the earth, to render the cement more binding. 4. The wax for inscriptions, coats of arms, &c. 5. The tallow equally mixed with the wax, in order to put a slight lay of it upon the outer mould, before any letters are applied to it. 6. The coals to dry the mould. For making the mould, they have a scaffold consisting of four boards, ranged upon trassels. Upon this they carry the earth, grossly diluted, to mix it with horse-dung, beating the whole with a large spatula. The compasses of construction are the chief instrument for making the mould: They

consist of two different legs joined by piece. And last of all, the founders the which are the engravings of the letters, coats of arms, &c. They first dig a sufficient depth to contain the mould of together with the case or cannon, under and about six inches lower than the top where the work is performed. The hole wide enough for a free passage between the and walls of the hole, or between one and another, when several bells are to be cast. At the centre of the hole is a stake erected strongly fastened in the ground. This is an iron peg, on which the pivot of the branch of the compasses turns. The stake is compassed with a solid brick work, perfectly about half a foot high, and of the proper diameter. This they call a *millstone*. The parts of the mould are, the core, the model of the bell, and the shell. When the outer surface of the bell is formed, they begin to raise the core, made of bricks that are laid in courses height upon a lay of plain earth. At the bottom of each brick, they bring near it the branch of the compasses, on which the curve of the bell is shaped, so as that there may remain between the curve the distance of a line, towards filled up with layers of cement. This is continued to the top, only leaving an opening for the coals to bake the core. This work is covered with a layer of cement, made of earth and horse-dung; on which they move the core of construction, to make it of an even surface every where. The first layer being finished, they put the fire to the core, by filling it half with coals through an opening that is kept shut during the baking, with a cake of earth that has been previously baked. The first fire consumes the cement, and the fire is left in the core half or some whole day: the first layer being thorough, they cover it with a second, third, and fourth, each being smoothed by the board of the furnace, and thoroughly dried before they put on another. The core being completed, they take the compasses to pieces, with intent to cut the thickness of the model, and the compasses are immediately put in their place to begin the piece of the mould. It consists of a mixture of earth and hair, applied with the hand upon the core, in several cakes that close together. The work is finished by several layers of a thin ment of the same matter, smoothed by the compasses, and thoroughly dried before another is laid on. The first layer of the model is a mixture of wax and grease spread over the whole, which are applied the inscriptions, coats of arms, &c. besmeared with a pencil dipped in a mixture of wax in a chafing dish: this is done for every part. Before the shell is begun, the compasses are taken to pieces, to cut off all the wood that is in the place of the thickness to be given to the bell. The first layer is the same earth with hair, sifted very fine; whilst it is tempering, it is mixed with cow's hair to make it more cohesive. The whole being a thin cullis, is gently pressed on the model, that fills exactly all the spaces of the figures, &c. and this is repeated till the whole is two lines thick over the model.

is thoroughly dried, they cover it with a second layer of the same matter, but somewhat thicker; they apply the compasses again, and light the core, so as to melt off the wax of the inside. After this, they go on with the rings of the shell, by means of the compasses they add to the cow's hair a quantity, spread upon the layers, and afterwards by the board of the compasses. The thickness of the shell comes to 4 or 5 inches in the mill-stone before observed, and is quite close, which prevents the extrusion of the metal. The wax should be taken off before the melting of the metal. The ear of the bell requires a separate work, which is done by the drying of the several incrustations of wax.

It has 7 rings: the 7th is called the crown, and unites the others, being a perpendicular to strengthen the curves. It has an opening at the top, to admit a large iron peg, and at the bottom; and this is introduced into the beam, fastened with two strong bolts.

There are models made of the rings, of beaten earth, that are dried in the sun to have the hollow of them. These are gently pressed upon a layer of earth and in, one half of its depth: and then taken out without breaking the mould. This operation is repeated 12 times for 12 half moulds, that two united may make the hollows of the rings; the same they do for the hollow of the crown, and bake them all, to unite them together. An open place left for the coals to be put in, and placed the rings that constitute the ear. Then put into this open place the iron ring, and the clapper of the bell; then they make a cake of clay, to fill up the diameter of the hollow of the core. This cake, after baked, is clapped upon the opening, and soldered with mortar spread over it, which binds it close to the core. The hollow of the crown is filled with an earth, sufficiently moist to be pressed in place, which is strewed at several times over the cover of the core; and they beat it gently with a pebble, to a proper height; and a workman smooths the earth at top with a wooden slip dipped in water. Upon this cover, to be removed afterwards, they assemble the hollows of the rings. When every thing is in its proper place, they strengthen the outside of the hollows with mortar, in order to bind them with the crown, and keep them steady at the bottom, by a cake of the same mortar, which fills the whole aperture of the shell. This they let dry, so that it may be removed without breaking. When the room for the metal, they pull off the crown, and the rings, through which the metal is to run, before it enters into the vacuity of the shell.

The shell being unloaded of its ear, they place under the mill-stone five or six pieces of wood, about two feet long, and thick enough to support the lower part of the shell; between the mill-stone and the mould, they drive in wooden wedges with a mallet, to shake the shell of the model so that it rests, so as to be pulled up and got out of the pit. When this and the wax are removed, they break the model and the layer of

earth, through which the metal must run, from the hollow of the rings, between the shell and the core. They smoke the inside of the shell, by burning straw under it, that helps to smooth the surface of the bell. Then they put the shell in the place, so as to leave the same interval between that and the core; and before the hollows of the rings or the cap are put on again, they add two vents, that are united to the rings, and to each other, by a mass of baked cement. After which they put on this mass of the cap, the rings, and the vent, over the shell, and solder it with thin cement, which is dried gradually by covering it with burning coals. Then they fill up the pit with earth, beating it strongly all the time round the mould. The surface has a place for the fire, and another for the metal. The fire place has a large chimney with a spacious ash-hole. The furnace which contains the metal is vaulted, whose bottom is made of earth, rammed down; the rest is built with brick. It has four apertures; the first, through which the flame revivifies; the second is closed with a stopple that is opened for the metal to run; the others are to separate the dross or scoriae of the metal by wooden rakes: through these last apertures passes the thick smoke. The ground of the furnace is built sloping, for the metal to run down.

2. **FOUNDRY OF GREAT GUNS AND MORTAR PIECES.** The method of casting these pieces is different from that of bells: they are run massy, without any core, being determined by the hollow of the shell; and they are afterwards bored with a steel trepan, that is worked either by horses or a water mill. For the metal, parts, proportions, &c. of these pieces, see **GUNNERY**.

3. **FOUNDRY OF LETTERS, OR CASTING OF TYPES FOR PRINTING.** In the business of cutting, casting, &c. letters for printing, the letter-cutter must be provided with a vice, hand vice, hammers, and files of all sorts such as watch makers use; also gravers and sculptors of all sorts, and an oil-stone, &c. suitable and sizeable to the several letters to be cut: a flat gauge made of box to hold a rod of steel, or the body of a mould, &c. exactly perpendicular to the flat of the using file: a sliding gauge whose use is to measure and set off distances between the shoulder and the tooth, and to mark off from the end, or from the edge of the work: a face gauge, which is a square notch cut with a file into the edge of a thin plate of steel, iron or brass, of the thickness of a piece of common tin, whose use is to proportion the face of each sort of letter, viz. long letters, ascending letters, and short letters. So there must be 3 gauges, and the gauge for the long letters is the length of the whole body supposed to be divided into 42 equal parts. The gauge for the ascending letters Roman and Italic are five 7ths, or 30 parts of 42, and 33 parts for the English face. The gauge for the short letters is three 7ths, or 18 parts of 42 of the whole body for the Roman and Italic, and 22 parts for the English face. The Italic and other standing gauges are to measure the scope of the Italic stems, by applying the top and bottom of the gauge to the top and bottom lines of the letters, and the other side of the gauge to the stem; for when the letter complies with these three sides

[illegible][illegible]

orkmen. The founder must now be provided with a ladle, which differs nothing from other ladles but in its size; and he is provided always with ladles of several sizes, which he uses according to the size of the letters he is to cast. As the caster begins to cast, he must kindle his fire in the furnace to melt the metal in the pan: therefore he takes the pan out of the hole in the floor, and there lays in coals and kindles them; and, when they are well kindled, he sets the pan again, and puts in metal into it to melt: if it is a small-bodied letter he casts, or a thin letter, great bodies, his metal must be very hot; nay sometimes red-hot, to make the letter come. He having chosen a ladle that will hold about as much as the letter and break are, he lays it at a slanting hole, where the flame bursts out, to melt. Then he ties a thin leather, cut with its narrow end against the face to the leather groove of the matrice, by whipping a brown thread twice round the leather groove, and fastening the thread with a knot. Then he puts both halves of the mould together, and puts the matrice into the middle of the mould, and places the foot of the matrice into the hole of the mould, and the broad end of the leather upon the wood of the upper half of the mould; but not tight up, lest it might hinder the putting of the matrice from sinking close down upon the metal in a train of work. Then laying a little wood on the upper wood of the mould, and having the casting ladle hot, he with the boiling side of it casts the metal: and, when it is yet melted, he with the broad end of the leather hard down on the wood, and so fastens it to the wood; all this is the preparation. Now he proceeds to casting; placing the under half of the mould in his left hand, with the hook or bag forward, he catches the ends of its wood between the lower part of the thumb and his three hind fingers; then he lays the upper half of the mould upon the under half, so that the male gauges may fall into the female gauges, and at the same time the foot of the matrice places itself upon the stool; and placing his left hand thumb strong over the upper half of the mould, he nimbly catches hold of the lower spring with his right hand fingers at the bottom, and his thumb under it, and places the bottom against the middle of the notch in the top of the matrice, pressing it both forwards and back the mould, and downwards by the shoulder of the notch close upon the stool; while at the same time with his hinder fingers, he draws the upper half of the mould towards the ball of his thumb, and thrusts by the ball of his thumb the lower part towards his fingers, that both the recesses of the mould may press against both sides of the matrice, and his thumb and fingers press both halves of the mould close together. Then he takes the handle of his ladle in his right hand, and with the bowl of it gives a stroke, two or three, upwards upon the surface of the melted metal, to turn or clear it from the film or dust that may form upon it; then he takes up the ladle full of metal, and having his mould, as aforesaid, in his left hand, he a little twists the left side of his body towards the furnace, and brings the gait of his ladle full of metal to the mouth of the mould, and with the upper part of his right hand towards

him to turn the metal into it, while at the same moment of time he jilts the mould in his left hand forwards, to receive the metal with a strong shake (as it is called), not only into the body of the mould, but while the metal is yet hot, running swift and strongly, into the very face of the matrice, to receive its perfect form there, as well as in the flank. Then he takes the upper half of the mould off the under half, by placing his right hand thumb on the end of the wood next his left hand thumb, and his two middle fingers at the other end of the wood; and finding the letter and break lie in the under half of the mould (as most commonly by reason of its weight it does), he throws or tosses the letter, break and all, upon a sheet of waste paper laid for that purpose on the bench, just a little beyond his left hand, and is then ready to cast another letter as before; and also, the whole number that is to be cast with that matrice. A workman will ordinarily cast about 3000 of these letters in a day. When the casters at the furnace have got a sufficient number of types upon the tables, a set of boys come and nimbly break away the jets from them: the jets are thrown into the pots, and the types are carried away in parcels to other boys, who pass them swiftly under their fingers, defended by leather, upon smooth flat stones, in order to polish their broad sides. This a very dexterous operation, and is a remarkable instance of what may be effected by the power of habit and long practice; for these boys, in turning up the other side of the type, do it so quickly by a mere touch of the fingers of the left hand, as not to require the least perceptible intermission in the motion of the right hand upon the stone. The types, thus finely smoothed and flattened on the broad sides, are next carried to another set of boys, who sit at a square table, two on each side, and are there ranged up on long rulers or sticks, fitted with a small projection, to hinder them from sliding off backwards. When these sticks are so filled, they are placed, two and two, upon a set of warden pins fixed into the wall, near the dresser, sometimes to the amount of an hundred, in order to undergo the finishing operations. This workman, who is always the most expert and skilful in all the different branches carried on at the foundery, begins by taking one of these sticks, and, with a peculiar address, slides the whole column of types off upon the dressing stick: this is made of well seasoned mahogany, and furnished with two end pieces of steel, a little lower than the body of the types, one of which is moveable so as to approach the other by means of a long screw-pin, inserted in the end of the stick. The types are put into this stick with their faces next to the back or projection; and after they are adjusted to one another so as to stand even, they are then bound up, by screwing home the moveable end-piece. It is here where the great and requisite accuracy of the moulds comes to be perceived; for in this case the whole column, so bound up, lies flat and true upon the stick, the two extreme types being quite parallel, and the whole has the appearance of one solid continuous plate of metal. The least inaccuracy in the exact parallelism of the individual type, when multiplied so many times, would render it impos-

able to bind them up in this manner, by disposing them to rise or spring from the stick by the smallest pressure from the screw. Now, when lying so conveniently with the narrow edges uppermost, which cannot possibly be smoothed in the manner before mentioned by the stones, the workman does this more effectually by scraping the surface of the column with a thick edged but sharp razor, which at every stroke brings on a very fine smooth skin, like to polished silver; and thus he proceeds till in about half a minute he comes to the farther end of the stick. The other edges of the types are next turned upwards, and polished in the same manner. It is whilst the types thus lie in the dressing stick that the operation of bearding or barbing is performed, which is effected by running a plane, faced with steel, along the shoulder of the body next to the face, which takes more or less off the corner, as occasion may require. Whilst in the dressing stick they are also grooved, which is a very material operation. To understand this, it must be remembered, that when the types are first broken off from the jets, some superfluous metal always remains, which would make them bear very unequally against the paper whilst under the printing press, and effectually mar the impression. That all these inequalities may, therefore, be taken away, and that the bearings of every type may be regulated by the shoulders imparted to them all alike from the mould, the workman or dresser proceeds in the following manner. The types being screwed up in the stick, as before mentioned, with the jet end outermost, and projecting beyond the wood about one 8th of an inch, the stick is put into an open press, so as to present the jet end uppermost, and then every thing is made fast by driving a long wedge, which bears upon a slip of wood, which lies close to the types the whole length: then a plane is applied, which is so constructed as to embrace the projecting part of the types betwixt its long sides, which are made of polished iron. When the plane is thus applied, the steel cutter bearing upon that part between the shoulders of the types, where the inequalities lie, the dresser dexterously glides it along, and by this means strips off every irregular part that comes in the way, and so makes an uniform groove the whole length, and leaves the two shoulders standing; by which means every type becomes precisely like to another, as to the height against paper. The types being now finished, the stick is taken out of the press, and the whole column replaced upon the other stick; and after the whole are so dressed, he proceeds to pick out the bad letters, previous to putting them up into pages and papers. In doing this he takes the stick into his left hand, and turning the faces near to the light, he examines them carefully, and whenever an imperfect or damaged letter occurs, he nimbly plucks it out with a sharp bodkin, which he holds in the right hand for that purpose. Those letters which, from their form, project over the body of the type, and which cannot on this account be rubbed on the stones, are scraped on the broad sides with a knife or file, and some of the metal next the face pared away with a pen-knife, in order to allow the type to come close to *any other.* *This operation is called* **KERNING.**

The excellence of printing types consists not in the due performance of all the operations as described, but also in the hardness of the metal, form, and fine proportion of the character, in the exact bearing and ranging of the letters in relation to one another.

4. **FOUNDRY OF SMALL WORKS, or CASTING IN SAND.** The sand used for casting small work is at first of a pretty soft, yellowish, and clayey nature: but it being necessary to strew charcoal dust in the mould, it at length becomes of a black colour. The red-hot metal, by burning of the sand, contributes also to blacken it. The sand is worked over and over, with a roller, or board, placed across a chest to receive it, and is by these means sufficiently prepared, and freed from small stones or hard lumps of sand. When done, they take a smooth wooden board of length and breadth proportional to the thing to be cast, and laying the first half of an open mould or wooden frame upon it, they place within the frame what they intend to cast, and then fill it up with the prepared sand, a little moistened to make it cohere properly, pressing it upon the pattern with the roller, so as to leave their impression in it. Along the middle of the mould is also placed half a small brass cylinder, to make an impression for the chief canal for the metal to run through when melted, into the models or patterns; from this chief canal are drawn several other canals, which extend to each model or pattern placed in the frame. Then placing the other half of the mould over the one with the patterns in it, so that the pins enter into the holes that correspond to them in the other, they proceed to work it in the same manner, so as to make the two cavities of the pattern fall exactly on each other. After the frames of the mould are thus finished, and the backs scraped smooth, they take out the patterns, first loosening them gently all round, that they may not give way. The moulds are then carried to the melter; who, after strewing mill-dust upon them, dries them in a kind of oven for that purpose. Both parts of the mould being dry, they are again joined together by means of the pins; and to prevent their giving way, by reason of the red metal passing through the chief cylindrical canal, they are screwed or wedged up in a pair of wooden screws, like a kind of press. When the moulds are thus prepared, the metal is melted in a crucible, of a size proportionate to the quantity of metal intended to be cast, and when brought to a proper heat, is poured into them at the mouth of the chief canal. When the moulds are cooled, the frames are unscrewed, and the cast work taken out of the sand, which is wet and worked over again for other castings.

5. **FOUNDRY OF STATUES.** The casting of statues depends on the due preparation of the wax, the core, the outer mould, the investment, the furnace to melt off the wax, and the upper to pour the metal. The pit is a hole dug in a dry place something deeper than the intended figure, and made according to the prominence of certain parts thereof. The inside of the pit is commonly lined with stone, or brick; or, when the figure is large, they sometimes work on the ground,

is a proper fence to resist the impulsion of the melted metal. The inner mould, or core is a rude sketch to which is given the intended attitude and colours. It is raised on an iron grate, strong enough to sustain it, and is strengthened within by several bars of iron. It is generally made either of potter's clay, mixed with hair and horse dung; or of plaster of Paris mixed with brick-dust. The use of the core is to support the wax, the weight, and lessen the weight of the metal. The iron bars and the core are taken out of the brass figure through an aperture left in it for that purpose, which is soldered up afterwards. It is necessary to leave some of the iron bars of the core, to contribute to the steadiness of the projecting part within the brass figure. The wax is a representation of the intended statue. If it be a piece of sculpture, the wax should be all of the sculptor's own hand, who usually forms it on the spot: Though it may be wrought separately in cavities, moulded on a model, and afterwards arranged on the ribs of iron over the grate; filling the vacant space in the middle with liquid plaster and brick-dust, whereby the inner core is proportioned as the sculptor carries on the wax. When the wax, which is the intended thickness of the metal is finished, they fill small waxen tubes perpendicular to it from top to bottom, to serve both as canals for the conveyance of the metal to all parts of the work; and as vent-holes, to give passage to the air, which would otherwise occasion great disorder when the hot metal came to encompass it. The work being brought thus far, must be covered with its shell, which is a kind of crust laid over the wax, and which being of a soft matter, easily receives the impression of every part, which is afterwards communicated to the metal upon its taking the place of the wax, between the shell and the mould. The matter of this outer mould is varied according as different layers are applied. The first is generally a composition of clay, and old white crucibles well ground and fired, and mixed up with water to the consistence of a colour fit for painting: accordingly they apply it with a pencil, laying it 7 or 8 times over, and letting it dry between whiles. For the 2d impression, they add horse-dung and earth to the former composition. The 3d impression is only horse-dung and earth. Lastly, the shell is finished by laying on several more impressions of this manner, made very thick with the hand. The shell, thus finished, is secured by several iron girths, bound round it, at about half a foot distance from each other, and fastened at the bottom to the grate under the statue, and at top to a circle of iron where they all terminate. If the statue be so big that it would not be easy to move the mould with safety, they must be wrought on the spot where it is to be cast. This is performed two ways: in the first, a square hole is dug under ground, much bigger than the mould to be made therein, and its inside lined with walls of free stone or brick. At the bottom is made a hole of the same materials, with a kind of furnace, having its aperture outwards: in this is a fire made to dry the mould, and afterwards melt the wax. Over the furnace is placed the grate, and upon this the mould, &c. formed as above. Lastly, at one of the

edges of the square pit, is made a large furnace to melt the metal. In the other way, it is sufficient to work the mould above ground, but with the like precaution of a furnace and grate underneath. When finished, 4 walls are to be run around it, and by the side thereof a massive made for a melting furnace. For the rest the method is the same in both. The mould being finished, and inclosed as described, whether under ground or above it, a moderate fire is lighted in the furnace under it, and the whole covered with planks, that the wax may melt gently down, and run out at pipes contrived for that purpose, at the foot of the mould, which are afterwards exactly closed with earth, so soon as the wax is carried off. This done, the hole is filled up with bricks thrown in at random, and the fire in the furnace augmented, till such time as both the bricks and mould become red-hot. After this, the fire being extinguished, and every thing cold again, they take out the bricks, and fill up their place with earth moistened, and a little beaten to the top of the mould, in order to make it the more firm and steady. These preparatory measures being duly taken, there remains nothing but to melt the metal, and run it into the mould. This is the office of the furnace above described, which is commonly made in the form of an oven with three apertures, one to put in the wood, another for a vent, and a third to run the metal out at. From this last aperture, which is kept very close, while the metal is in fusion, a small tube is laid, whereby the melted metal is conveyed into a large earthen basin, over the mould, into the bottom of which all the big branches of the jets, or casts, which are to convey the metal into all the parts of the mould, are inserted. These casts or jets are all terminated with a kind of plugs, which are kept close, that, upon opening the furnace, the brass, which gushes out with violence, may not enter any of them, till the basin be full enough of matter to run into them all at once. Upon which occasion they pull out the plugs, which are long iron rods with a head at one end, capable of filling the whole diameter of each tube. The whole of the furnace is opened with a long piece of iron fitted at the end of each pole, and the mould filled in an instant. This completes the work in relation to the casting part; the rest being the sculptor's or carver's business, who, taking the figure out of the mould and earth wherewith it is encompassed, saws off the jets with which it appears covered over, and repairs it with chisels, gravers, punchcons, &c.

* FOUNTAINLESS. *adj.* [from *fountain*.] Having no fountain; wanting a spring.—

So large

The prospect was, that here and there was room For barren desert *fountainless* and dry. *Milt.*

* FOUNTFUL. *adj.* [from *font* and *full*.] Full of spring.—

But when the *fontful* Ida's top they scal'd with utmost haste,

All fell upon the high hair'd oak. *Chap. II.*

* To FOUPE. *v. a.* To drive with such intemperance. A word out of use.—We pronounced by the collection of strangers, a word not so moderately as any of the northern nations.

solape their words out of the throat with fat and full spirits. *Camden.*

FOUQUIERES, James, an eminent painter, born at Antwerp in 1580. He received his chief instructions from Velvet Brughel; and applied himself to the study of landscapes, and went to Rome and Venice to improve himself in colouring. He succeeded so happily, that his works are said to be nearly equal to those of Titian. He was much caressed at the elector Palatine's court, and afterwards spent several years in France; where his works met with universal approbation, and were proportionably well paid for. Yet by some misconduct he fell into poverty, and died in the house of an inconsiderable painter in 1659.

(1.) * **FOUR.** *adj.* [*fower*, Saxon.] Twice two.—

Just as I wish'd, the lots were cast on *four*;
Myself the fifth. *Pope's Odyssey.*

(2.) **Four**, in geography, a rock in the British Channel, near the S. coast of Jersey.

* **FOURBE.** *n. f.* [French.] A cheat; a tricking fellow. Not in use.—

Jove's envoy, through the air,
Brings dismal tidings: as if such low care
Could reach their thoughts, or their repose disturb!

Thou art a false impostor, and a *fourbe*. *Denb.*
FOURCES, a town of France in the dept. of Gers, 6 miles WNW. of Condom.

FOURCHE, a chain of mountains in the Helvetic republic, at the E. extremity of the Valais.

FOURCHEE, or } in heraldry, a cross forked at
FOURCHY, } the ends. See **HERALDSY**.

FOUR-FEET ISLAND, an island on the coast of Kent, near Margate Road.

* **FOURFOLD.** *adj.* [*four* and *fold*.] Four times told.—He shall restore the lamb *fourfold*, because he had no pity. 2 *Sam.* xii. 6.

* **FOURFOOTED.** *adj.* [*four* and *foot*.] Quadruped; having twice two feet.—

Augur Astylos, whose art in vain
From fight dissuaded the *fourfooted* train,
Now beat the hoof with Nessus on the plain. }
Dryden.

(1.) **FOUR-MILE WATER**, a river of Ireland in Cork, which runs into Dunniannus Bay, 5 miles SW. of Bantry.

(2.) **FOUR-MILE WATER**, a village of Ireland in Waterford, 4 miles from Clonmell.

(1.) **FOURMONT**, Stephen, professor of the Arabic and Chinese languages, and one of the most learned men of his time, was born at Herbelai, a village 12 miles from Paris, in 1683. He studied in Mazarine college, and afterwards in the Seminary of Thirty-three. He was at length professor of Arabic in the Royal College, and was made a member of the Academy of Inscriptions. In 1738 he was chosen F. R. S. in London, and of that of Berlin in 1741. He was often consulted by the duke of Orleans, who greatly esteemed him, and made him one of his secretaries. He wrote a great number of books. The chief of those which have been printed are, 1. *The Roots of the Latin Tongue*, in verse. 2. *Critical Reflections on the Histories of ancient Nations*, 2 vols 4to. 3. *Meditationes Senecae*, folio. 4. *A Chinese Grammar, in Latin*, folio. 5. *Several Dissertations printed*

in the Memoirs of the Academy of I &c. He died at Paris in 1745.

(2.) **FOURMONT**, Michael, youngest Stephen, (N^o 1.) took orders, was p the Syriac language in the Royal Col member of the Academy of Inscription in 1746.

FOURNEAUX' ISLAND, a small island in the S. Pacific Ocean. Lon. Lat. 17 11. S.

FOURNELS, a town of France, in Lozere, 7 miles W. of St Chely.

(1.) **FOURNESS**, a track in Loynsd shire, between the Kent, Leven, and Sands, which runs N. parallel with th of Cumberland and Westmoreland, and runs into the sea as a promontory. H Camden expresses it, "the sea, as if it, lashes it more furiously, and in high even devoured the shore, and made 3 viz. Kent-sand, into which the river K itself; Leven-sand and Dudden-sand which the land projects in such a man has its name thence; Foreness and Fornifying the same with us as *promontori* in Latin." Bishop Gibson, however, name of *Fourness*, or *Furness*, from the *furnaces* that were there anciently, the services of which (called *bloomsmiting*) still paid. Here are several cotton mills few years ago; and if fuel for fire plentiful, the trade of this country would increase: but there being no coals near Wigan, or Whitehaven, firing is rather the country people using only turf or the mosses of Fournels much fir is more oak: the trunks in general lie heads to the east, the high winds having the west. Fourness produces all sorts but principally oats, whereof the bread is made; and there are veins of a very ore, which is not only melted and wrought exported in great quantities. The three above-mentioned are very dangerous to by the tides and the many quicksands. a guide on horseback appointed to Kester sand at 10l. a year, to Leven at the public revenue; but to Dudden sand are most dangerous, none; and it is a common thing for persons to pass over it 100 at a time like caravans, under the of the carriers, who pass every day. are less dangerous than formerly, being and better known, and travellers without guides.

(2.) **FOURNESS ABBEY**, or "FURNIS in the mountains," was begun at Tuncunderness, in 1124, by Stephen earl of Savigni in France, and 3 years after to the valley, then called *Bekangejill* vale of night shade." It was of the Cistercians, endowed with above 800l. per ann the monks of this abbey, Camden says, of the Isle of Man, which lies over against to be chosen by ancient custom; it were the mother of many monasteries in Ireland. Some ruins, and part of the f

ed the monastery, are still to be seen at

The remains at Fournels breathe the simplicity of the Cistercian abbeys; the gate was the only piece of elegant Gothic it, and its roof has lately fallen in. The painted glass from the E. window, representing the crucifixion, &c. is preserved at the church in Bowthel, Westmoreland. (except the N. side of the nave), the aisle, refectory, &c. remain, only un-

FOUNESS FIELDS, high hills, with vast extent, in the above district, (N^o 1.) among the ancient Britons found a secure refuge from the victorious Saxons: for we find here 228 years after the arrival of the when Egfrid king of Northumberland subjugated the land called *Carthmell*, with its towns in it, as is related in his life. In the mountains are quarries of a fine durable blue covering buildings, which are used in parts of the kingdom. The inhabitants are numerous of sheep, which browse upon the hills. The woods afford charcoal for smiths, and oak bark for tanners, in great quantities. The forests abound with deer and stags, and the *leggs* or *jacks*, or large stags, are frequently found underground.

FOU, a town of Asiatic Turkey, in Caria, 14 miles WSW. of Satalia.

FOUR-LEAF FLOWER. See *MIRABILIS*.

FOUR-EVAUX, a town of France, in the dep. of Upper Garonne, 10 m. S. of Toulouse.

FOUR, *adj.* [from *four* and *score*.] 1. Four; eighty.—When they were out of the turn I had crossed the ocean to Spain, and forgot the names of their ships, and the greater part of them. *Bacon's War with Spain*.—The first a free people, being a commonwealth maintaining a navy of *four-score* ships. *Samuel Purchas* had, by the practice of near years, obtained great veneration from all the sailors. *Clarendon*. 2. It is used elliptically for *four-score* years in numbering the age of

seventeen years many their fortunes seek; *four-score* it is too late a week. *Shak.*

It might be of use in council upon great matters three-score and ten; and the numbers in Spain were so 'till *four-score*.

FOUR-STONES, a village of Oxfordshire, 12 m.

FOUR-SQUARE, *adj.* [from *four* and *square*.] Quadrangular, having four sides and angles equal.—The city of Bel was invironed with a wall carved of great height and beauty; and there were certain brazen gates curiously engraven. *Reliquie's Hist.*

FOURTEEN, *adj.* [from *four* and *teen*.] Fourteen; sixteen.—I am not *fourteen* pence for the ale. *Shak.*

FOURTEENTH, *adj.* [from *fourteen*.] The fourteenth; the fourth after the tenth.—The fourth day that see the ninth day, few see the fourth, and the eyes of some do not open the *fourteenth* day. *Brown's Vulg. Err.*

A. Paar. L

(1.) * **FOURTH**, *adj.* [from *four*.] The ordinal of four; the first after the third.—

A third is like the former: filthy hags!

Why do you shew me this? A *fourth*? Start eyes!

What? will the line stretch out to th' crack of doom? *Shak.*

(2.) **FOURTH REDUNDANT**, in music. See *INTERVAL*.

* **FOURTHLY**, *adv.* [from *fourth*.] In the fourth place.—*Fourthly*, plants have their seed and seminal parts uppermost, and living creatures have them lowermost. *Bacon's Nat. Hist.*

* **FOURWHEELED**, *adj.* [from *four* and *wheel*.] Running upon twice two wheels.—

Scarce twenty *fourwheel'd* cars, compact and strong,

The massy load could bear, and roll along.

Pope's Odyssey.

FOUSSERET, a town of France in the dep. of the Upper Garonne; 2 miles W. of Rieux, and 27 SW. of Toulouse.

(1.) **FOU-TCHEOU**, a city of China of the 1st rank in the province of FO-KIEN. It carries on a great trade; and has a good harbour and a most magnificent bridge, which has more than 100 arches, constructed of white stone, and ornamented with a double balustrade throughout. It is the residence of a viceroy, and has under its jurisdiction 9 cities of the 3d class. It lies 870 miles S. of Peking. Lon. 136. 50. E. Ferro. Lat. 26. 4. N.

(2.) **FOU-TCHEOU**, a city of China of the 1st rank, in the prov. of Kiang si; formerly one of the finest cities in the empire, but almost ruined by the Tartar invasion. It lies 735 miles E. of Peking. Lon. 133. 42. E. of Ferro. Lat. 27. 55. N.

* **FOUTRA**, *n. f.* [from *foutre*, French.] A fig; a scold; a word of contempt. Not used.—

A *foutra* for the world, and a worldling's base.

South. Prov. IV.

FOUYENT LA VILLE, a town of France, in the dep. of Upper Saone; 7 m. NE. of Champlate.

(1.) **FOWEY**, **FAWEY**, or **LOY**, a populous and flourishing town of Cornwall, with a commodious haven on the British Channel. It extends above 1 mile on the E. side of the river. (N. 2.) and has a great share in the fishing trade, especially of pilchards. It rose so much formerly by naval wars and piracy, that in the reign of Edward III. its ships refusing to strike when required, as they failed by Rye and Winchelsea, were attacked by the ships of those ports, but defeated them: whereupon they bore their arms mixed with the arms of those two cinque ports, which gave rise to the name of the "Gallants of Fowey." And Camden informs us that this town quartered a part of the arms of all the other Cinque Ports with their own; intimating, that they had at times triumphed over them all: and indeed once they were so powerful, that they took several French men of war. In the reign of Edward III. they refused certain ships of Rye from distress, for which this town was made a member of the Cinque Ports. Edward IV. favoured Fowey so much, that when the French threatened to come up the river to burn it, he caused two towers, the ruins of which are yet visible, to be built at the public charge for its security: but he was afterwards reproved at the inhabitants for attacking the French.

after a truce proclaimed with Lewis XI. that he took away all their ships and naval stores, together with a chain drawn across the river between the two forts, which was carried to Dartmouth. It is said they were so insolent, that they cut off the ears of the king's pursuivants; for which some lives and estates were forfeited. The corporation consists of a mayor, recorder, 8 aldermen, a town clerk, and 2 assistants; the market is on Saturday; the fairs on May day and Sept. 10. Here are a fine old church, a free school, and an hospital. The toll of the market and fairs, and keyage of the harbour, were vested in the corporation on the payment of a fee-farm rent of about 4cs. It has sent 4 members to parliament since the 13 of Q. Elizabeth. Fowey lies 32 miles S. of Launceston; 32 ENE. of Falmouth, 26 of Plymouth, and 240 WSW. of London. Lon. 4. 23. W. Lat. 50. 19. N.

(2.) FOWEY, PAWEY, FOUTH, or FOY, a river of Cornwall, which rises 4 miles SE. of Camel-ford, passes by Lestwithiel, and runs into the British Channel, a little below POWEY (N. 1.) where it is very broad and deep. It was formerly navigable up to Lestwithiel.

(1.) * FOWL. *n. f.* [*fugel*, *fuhl*, Saxon; *voegel*, Dutch.] A winged animal; a bird. It is colloquially used of edible birds, but in books of all the feathered tribes. *Fowl* is used collectively: as, we dined upon fish and *fowl*.—

The beasts, the fishes, and the winged *fowl*,
Are their males subjects, and at their controul.

Shak.

—Lucullus entertained Pompey in a magnificent house: Pompey said, this is a marvellous house for the Summer; but methinks very cold for the Winter. Lucullus answered, do you not think me as wise as divers *fowls*, to change my habitation in the Winter Season? *Bacon's Apoph.*—

This mighty breath

Instructs the *fowls* of heaven.

Thomson.

(2.) FOWL, among zoologists, denotes the larger sorts of birds, whether domestic or wild: such as geese, pheasants, partridges, turkey, ducks, &c. Tame fowl make a necessary part of the stock of a country farm. See POULTRY. Fowls are again distinguished into two kinds, *viz.* *land* and *water* fowls, these last being so called from their living much in and about water: also into those which are accounted *game*, and those which are not. See GAME.

* To FOWL. *v. n.* [from the noun.] To kill birds for food or game.

* FOWLER. *n. f.* [from *fowl*.] A sportsman who pursues birds —

The *fowler*, warn'd

By those good omens, with swift early steps

Treads the crimp earth, ranging through fields
and glades,

Offensive to the birds.

Philips.

With slaught'ring guns th' unwearied *fowler*
roves,

When frosts have whiten'd all the naked groves.

Pope.

(1.) FOWLING, *n. f.* the art of catching birds by means of bird lime, decoys, and other devices; or the killing of them by the gun. See BIRD-CATCHING, BIRD LIME, DECOY, & SHOOTING, and the names of the different birds in their order.

(2.) FOWLING is also used for the pursuing taking birds with hawks, more properly called FALCONRY or HAWKING. See these articles.

(1.) * FOWLINGPIECE. *n. f.* [*fowl* and *piece*.] A gun for birds.—'Tis necessary that the countryman be provided with a good *fowlingpiece*. *As*

(2.) FOWLINGPIECES are reckoned best, when they have a long barrel, from 5½ to 6 feet, and a moderate bore. But every fowler should have them of different sizes, suitable to the game he designs to kill. The barrel should be well polished and smooth within, and the bore of an even bigness from one end to the other; which may be improved, by putting in a piece of pasteboard, of the exact roundness of the top: for if this is done down without stops or stopping, you may conclude the bore good. The bridge-pan must be somewhat above the touch hole, and ought to have a notch to let down a little powder: this will prevent the piece from recoiling, which it would otherwise be apt to do. As to the locks, choose such as are well filed with true work, and the springs must be neither too strong nor too weak. The hammer ought to be well hardened, and pliable to go down to the pan with a quick motion.

(1.) FOWLNESS, a village in Norfolkshire.

(2.) FOWLNESS ISLAND. See FOULNESS.

(3.) FOX, George, the founder of the Free Quakers, was a shoemaker in Nottingham. When he wrought at his trade, he used to meditate much on the scriptures; which, with his solitary course of life, improving his natural melancholy, he began at length to fancy himself inspired; in consequence thereof set up for a preacher. He proposed but few articles of faith; insisting chiefly on moral virtue, mutual charity, the love of God, and a deep attention to the inward motions and secret operations of the spirit: he recommended a plain simple worship, and a religion without ceremonies, making it a principal point to converse in profound silence the directions of the Spirit. Fox met with much rough treatment for his zeal, was often imprisoned, and several times in danger of being killed. But in spite of all discouragements his sect prevailed much, and many great men were drawn over to them; among whom were BARCLAY and PENN. He died 1681. See QUAKERS.

(2.) FOX, John, the martyrologist, was born at Bolton in Lincolnshire, in 1517. At 16 he was entered a student of Brazen-nose college, Oxford; in 1543, he proceeded M. A. and was chosen fellow of Magdalen college. He discovered an early genius for poetry, and wrote several Latin comedies on Scriptural subjects, which his son assures us were written in an elegant style. He now applied himself with uncommon assiduity to divinity, particularly church history; and, discovering a mature propensity to the doctrine of reformation, he was expelled the college as an heretic. His distress on this occasion was very great; but he soon found an asylum in the house of Sir Thomas Lucy of Warwickshire, who employed him as tutor to his children. Here he married the daughter of a citizen of Coventry. Sir Thomas's children being grown up, after residing a short time with his wife's father, he came to London; finding no immediate means of subsistence, he

d to the utmost degree of want; but as one day sitting in St Paul's church, emaciated with hunger, a stranger accosted him familiarly, bidding him be of good cheer, put a shilling into his hand; telling him at the same time, that in a few days new hopes were before him. He was soon after taken into the family of the Duke of Richmond, as tutor to the earl's children. In this family he lived, at first in Surrey, during the latter part of the reign of Henry VIII. the entire reign of Edward VI. and part of that of Q. Mary I: but at length, persecuted by his implacable enemy Bp. Gardiner, he was obliged to seek refuge abroad. Basil in France was the place of his retreat, where he was employed in correcting the press. On the death of the Duke of Richmond he returned to England; where he was warmly received by his former pupil the duke of Norfolk, who retained him in his family as long as he lived, and bequeathed him a pension at his death.

Mr Secretary Cecil also obtained for him a rectory at Shipton near Salisbury; and he having had considerable preferment, had he been willing to subscribe to the canons. He died at the age of 70; and was buried in the chancel of St. Giles's, Cripplegate. He was a man of industry, and considerable learning; a zealous but not a violent reformer; a nonconformist, and an enemy to the church of England. He had two sons; one of whom was bred a divine, the other a physician. He wrote many pieces: his principal work is, the *Acts and Monuments* of the Church, &c. commonly called *Fox's Book of Martyrs*.

* **FOX**. *n. f.* [*fox*, Saxon; *vos*, *voseb*, &c.] 1. A wild animal of the canine kind, with sharp ears, and a bushy tail, remarkable for its cunning, living in holes, and preying upon small animals.—

He *fox* backs not when he would steal the lamb. *Shak.*

He that trusts to you,
Where he should find you lions, finds you hares;
He *foxes*, geese. *Shak. Macbeth.*

His retreats are more like the dens of robbers,
Than of *foxes*, than the fortresses of fair war-
riors. *Locke.* 2. By way of reproach, applied to a cunning fellow.

FOX, in zoology. See **CANIS**, § I, N° xvi, 1. The fox is a great nuisance to the husbandman, by taking away and destroying his lambs, poultry, &c. The common way to catch him is, by which being baited, and a train made by hanging raw flesh across in his usual paths or leading to the gin, it proves an inducement to him to the place of destruction. The fox is a beast of chase, and is taken with greyhounds, harriers, &c. See **HUNTING**.

FAXALL, a town SE. of Ipswich, Suffolk.

FAXBROOK, a village in Staffordshire.

FOXCASE. *n. f.* [*fox* and *case*.] A fox's skin.—
It had better be laughed at for taking a *foxcase* than a fox, than be destroyed by taking a live fox.
L'Estrange.

FOXCHASE. *n. f.* [*fox* and *chase*.] The pursuit of a fox with hounds.—

See the same man, in vigour, in the gout;
And in company; in place or out;

Early at business, and at hazard late;

Mad at a *foxchase*, wise at a debate. *Boyd.*

FOXERNA, a town of Sweden, in W. Gothland; 25 miles N. of Gothenburg.

* **FOXEVIL**. *n. f.* [*fox* and *evil*.] A kind of disease in which the hair sheds.

* **FOXFISH**. *n. f.* [*vulpesula piscis*.] A fish.

FOXFORD, a town of Ireland, in Mayo county, seated on the May, 8 miles N. of Castlebar, and 17 1/2 NW. of Dublin.

(1.) * **FOX-GLOVE**. *n. f.* [*digitalis*.] A plant.

(2.) **FOX GLOVE**, in botany. See **DIGITALIS**.

FOXHAM, a village NW. of Calne, Wilts.

* **FOXHUNTER**. *n. f.* [*fox* and *hunter*.] A man whose chief ambition is to show his bravery in hunting foxes. A term of reproach used of country gentlemen.—The *foxhunters* went their way, and then out steals the fox. *L'Estrange*.—John Wildfire, *foxhunter*, broke his neck over a six-bar gate. *Speck.*

(1.) **FOX ISLAND**, an island in Atlantic, on the W. coast of Ireland; 7 miles E. of Slyme-Head.

(2.) **FOX ISLANDS**, or **LYSSIE OSTROVA**, a group of 16 islands situated between the E. coast of Kamtschatka, and the West. coast of America. Each Island has a particular name; but the general name, *Fox Islands*, is given to the whole group, on account of the great number of black, grey, and red foxes with which they abound. They are called *Lyffe Ostrova*, by the Russians. The dress of the inhabitants consists of a cap and a fur coat, which reaches down to the knee. Some of them wear common caps of a party-coloured bird's skin, upon which they leave part of the wings and tail. On the fore part of their hunting and fishing caps, they place a small board like a screen, adorned with the jaw-bones of sea bears, and ornamented with glass beads, which they receive in barter from the Russians. At their festivals and dancing parties, they use a much more showy sort of caps. They feed upon the flesh of all sorts of sea animals, and generally eat it raw. But when they choose to dress their victuals, they use a hollow stone; having placed the fish or flesh therein, they cover it with another, and close the interstices, with lime or clay. They then lay it horizontally upon two stones, and light a fire under it. The provision intended for keeping is dried without salt in the open air. Their weapons consist of bows, arrows, and darts; and for defence they use wooden shields. The most perfect equality reigns among these islanders. They have neither chiefs nor superiors, neither laws nor punishments. They live together in families, and societies of several families united, which form what they call a *race*, who, in case of an attack or defence, mutually help and support each other. The inhabitants of the same island always claim to be of the same race; and every person looks upon his island as a possession, the property of which is common to all the individuals of the same society. Feasts are very common among them, and more particularly when the inhabitants of one island are visited by those of the others. The men meet their guests beating drums, and preceded by the women, who sing and dance. At the conclusion of the dance, the hosts serve up their best provisions, and invite their guests to partake of the feast. They feed their children

when very young with the coarsest flesh, and for the most part raw. If an infant cries, the mother immediately carries it to the sea side, and whether it be summer or winter, holds it naked in the water until it is quiet. This custom is so far from doing the children harm, that it hardens them against the cold, and they accordingly go barefooted through the winter without the least inconvenience. They seldom heat their dwellings; but when they are desirous of warming themselves, they light a bundle of hay, and stand over it; or set fire to train-oil, which they pour into a hollow stone. They have a good share of plain natural sense, but are rather slow of understanding. They seem cold and indifferent in most of their actions; but let an injury, or even a suspicion of one rouse them from this phlegmatic state, and they become furious and inflexible, taking the most violent revenge without any regard to the consequences. The least affliction prompts them to suicide; the apprehension of even an uncertain evil often leads them to despair. Lat. between 52° and 55° N.

FOXLEY, 2 villages: 1 in Norfolk, SW. of Repeham: 2 in Wilts, near Malmesbury.

* FOXSHIP. *n. f.* [from *fox*.] The character or qualities of a fox; cunning; mischievous art.—

Had'st thou *foxship*

To banish him that struck more blows for Rome,
Than thou hast spoken words. *Shak. Coriol.*

* FOXTAIL. *n. f.* [*alepecomus*] A plant.

FOXTON, 3 English villages: 1. in Cambridge; 2. in Durham: 3. in Leicestershire.

* FOXTRAP. *n. f.* [*fox* and *trap*.] A gin or snare to catch foxes.—Answer a question, at what hour of the night to set a *foxtrap*? *Tutor.*

(1.) * FOY. *n. f.* [*foi*, Fr.] Faith; allegiance. An obsolete word.—

He Easterland subdued, and Denmark won,
And of them both did *foy* and tribute take.

Fairy Queen.

(2, 3.) FOY, in geography. See FOWAY.

(4.) FOY, ST, a town of France in the dep. of Lot and Garonne, 35 miles E. of Bourdeaux. Lon. 0. 5. E. Lat. 44. 49. N.

FOYE, a village in Herefordshire.

(1.) FOYLE, a river of Ireland in Derry; which runs by Londonderry, into LOUGH FOYLE. See N° 1.

(2.) FOYLE, LOUGH, a large bay of Ireland; at the mouth of the Foyle (N° 1.) 4 miles below Londonderry. It is 12 miles long and 7 broad, and is well sheltered by the land on all sides; the entrance not exceeding half a mile wide, having only one deep channel in the middle between sands and shallows.

FOYN'S ISLAND, an island of Ireland, in the Shannon, 21 miles below Limerick.

FOYN TON, a town of Sussex, W. of Pevensey.

FOYSTON, W. of Knaresborough, Yorkshire.

(1.) FOZ, a town of France, in the dep. of the Mouths of the Rhone, 5 miles W. S. W. of Martigues.

(2.) Foz, a town of France, in the dep. of Var, 8 miles NE. of Barjols.

(3.) Foz, a town of Portugal, in the prov. of Aliento; at the conflux of the Zayas and the Tagus, 24 miles NE. of Lisbon.

FOZA, a district of Maritime Austria, of the 7 Communes in the Vicentino.

FOZZANO, a town of the French rep. in the island and dept. of Corsica; 4 miles Sarzano.

FRACAS, *n. f.* [French, pronounced *Franoise*; a hurly-burly.

FRACASTOR, Jerome, a most eminent poet and physician, born at Verona in 1483. Two singularities are related of him: one is his lips adhered so closely to each other he came into the world, that a surgeon was obliged to divide them with his knife; the other his mother was killed with lightning, while he was in her arms at the very moment, and unhurt. He was eminently skilled in the letters, and in all arts and sciences. He was a poet, a philosopher, a physician, an astronomer and a mathematician. Pope Paul III. made use of his authority to remove the council of Trent to Boulogne, under the pretext of a contagious distemper, which, as Fracastor deposed, was no longer safe to continue at Trent. He was intimately acquainted with cardinal Bembo, Scaliger, and all the great men of his time. He died of an apoplexy at Casti near Verona in 1553: and in 1559, the town of Verona erected a statue in honour of him. He was the author of many performances, both as a poet and as a physician; no man was ever more distinguished in either of these capacities: for he practised without fees, and as a poet whose usual reward was glory, no man was ever more dissident about money. Owing to this diffidence, little of his poetry is extant, in comparison of what he wrote; and his Odes and Epigrams, which were read with admiration, yet never passing the press. All that remain are his 3 books of "Symptoms of the French disease;" a book of Miscellaneous Poems; and two books of a poem, intitled, which he began towards the end of his life did not live to finish. And these would have been finished with the rest, if his friends had not preserved and communicated copies of them. He composed also a poem, called *Alcon, sive de canum venaticorum*. His works are all in Latin. His medical pieces are, *De Sympthia & Catarrhia*; *De contagione & contagiosis morbis*; *De febribus criticorum dierum*; *De vini temperaturis*. His works have been printed separately and collectively. The best edition is that of Padua in 2 vols 4to.

FRACHES, in the glass trade, are the pans into which the glass vessels already made are put when in the tower over the workman's place, and by means of which they are drawn through the leers, that they may be taken easily from the fire, and cool by degrees.

* To FRACT. *v. a.* [*fractus*, Lat.] To break; to violate; to infringe. Pound perhaps the following passage.—

His days and times are past,
And my reliance on his *fractured* dates
Has suit my credit. *Shak.*

(1.) * FRACTION. *n. f.* [*fraction*, Fr. Latin.] 1. The act of breaking; the state of being broken.—The surface of the earth has

the parts of it dislocated; several parts retain still the evident marks of *fracture*. *Burnet's Theory*. 2. A broken part al.—

actions of her faith, arts of her love, ments, scraps, the bits and greasy remains
er-eaten faith, are bound to Diomedes.

Shak.

the motion of the moon, whereby computed, nor the sun, whereby years are, consisteth of whole numbers, but *fractions* and broken parts. *Broqua's curs.*—Pliny put a round number rather than a *fraction*, *Arbutb. on Coins*. *CTION*, in arithmetic and algebra, a tion of an unit or integer; or a number to an unit in the relation of a part e. The word literally imports a broken. Fractions are usually divided into *xagefimal*, and vulgar. See ALGEBRA *METRIC*.

THONAL. adi. [from *fraction*.] Be a broken number; comprising a broken.—We make a cypher the medium between increasing and decreasing numbers, compounded absolute or whole numbers, and *fractional* numbers. *Coker's Arithmetick*. *RACTURE. n. f.* [*fractura*, Lat.] 1. Separation of continuous parts.—That without any great *fracture* of the more parts of nature, or the infringement thereof. *Hale's Origin of Mankind*. 2. Separation of a continuity of a bone in *fracture*.

you wilt sin and grief destroy,
the broken bones may joy,
be together in a well-set song,
of his praises,
dead men raises;
as well cur'd make us more strong.

Herbert.

of the skull are dangerous, not in consequence of the injury done to the cranium itself, but because the brain becomes affected. *Sharp's Surg.* *RACTURES*. See SURGERY.

RACTURE. v. a. [from the noun.] To break.—The leg was dressed and the *fractures* united together. *Wijeman's Surgery*. *FRUM, or FRENUM, BRIDLE*, in anatomy given to divers ligaments, from their restraining and curbing the motions of the parts they are fitted to: as,

FRUM LINGUÆ, or *Bridle of the Tongue*; *FRUM* ligament, which ties the tongue to the pharynx, larynx, fauces, and lower parts of the throat. In some subjects the *frænum* runs the length of the tongue to the very tip; in others, if it were not cut, it would take away the possibility of speech. See SURGERY, *Ind.* *FRUM PENIS*, a slender ligament, where the prepuce is tied to the lower part of the penis. Nature varies in the make of it; it being so short in some, that unless dissected it would not admit of perfect erection. It is a kind of little *frænum*, fastened to the lower part of the clitoris.

FRAGA, a strong town of Spain in the kingdom of Arragon. It is situated among the mountains, having the river Cinca before it, whose high banks are difficult of access; and at its back a hill, which cannot easily be approached with large cannon. Alphonso VII, king of Arragon, and I. of Castile, was killed by the Moors in 1134, in besieging this town. It is 53 miles ESE. of Saragossa, and 30 S. of Balbastro. Lon. o. 23. E. Lat. 41. 27. N.

FRAGARIA, the **STRAWBERRY**: A genus of the polygynia order, belonging to the icosandria class of plants; and in the natural method ranking under the 35th order, *Senticoſa*. The calyx is decemfid; the petals five; the receptacle of the seeds ovate, in the form of a berry, and deciduous. There is but one species, 12.

FRAGARIA VESCA, the cultivated Strawberry. The principal varieties are,

1. **FRAGARIA VESCA ALPINA**, the *Alpine*, or *mountain Strawberry*, having small oval leaves, small flowers, and moderate-sized, oblong, pointed fruit.

2. **FRAGARIA V. CHILCENSIS**, the Chili strawberry, with large, oval, thick, hairy leaves, large flowers, and very large firm fruit.

3. **FRAGARIA V. MOSCHATA**, the *hautboy*, or *musky Strawberry*, having oval, lanceolate, rough leaves, and large pale-red fruit.

4. **FRAGARIA V. SYLVESTRIS**, the wood strawberry, with oval sawed leaves, and small round fruit.

5. **FRAGARIA V. VIRGINIENSIS**, the Virginian scarlet strawberry, with oblong oval sawed leaves, and a roundish scarlet-coloured fruit. All these varieties are hardy, low, perennials, durable in root, but the leaves and fruit stalks are renewed annually in spring. They flower in May and June, and their fruit comes to perfection in June, July, and August; the Alpine kind continuing till the beginning of winter. They all prosper in any common garden soil, producing abundant crops annually without much trouble. They increase exceedingly every summer, both by off-sets or suckers from the sides of the plants, and by runners or strings, all of these rooting and forming plants at every joint, each of which separately planted bears a few fruit the following year, and bears in great perfection the succeeding summer. Those of the Alpine kind (N^o 1.) will even bear fruit the same year that they are formed. All the sorts are commonly cultivated in kitchen gardens, in beds or borders of common earth, in rows lengthwise 15 or 18 inches distance; the plants the same distance from one another in each row. Patches of the different sorts, disposed here and there in the fronts of the different compartments of the pleasure ground, will appear ornamental both in their flowers and fruit, and make an agreeable variety. Strawberries, eaten either alone, or with sugar and cream, are universally esteemed a most delicious fruit. They are grateful, cooling, subacid, and juicy. Though taken in large quantities, they seldom disagree. They promote perspiration, impart a violet smell to the urine, and dissolve the tartareous incrustations on the teeth. People afflicted with the stone have found relief by using them very largely; and Hoffman says, he has known

known consumptive people cured by them. The bark of the root is astringent. Sheep and goats eat the plant: cows are not fond of it; horses and swine refuse it.

* **FRAGILE.** *adj.* [*fragile*, Fr. *fragilis*, Lat.] 1. Brittle; easily snapped or broken.—

To ease them of their griefs,
Their pangs of love, and other incident throes,
That nature's *fragile* vessel doth sustain
In life's uncertain voyage. *Shak. Timon.*

—The stalk of ivy is tough and not *fragile*. *Bacon's Natural History.*—

When subtle wits have spun their threads too fine,

'Tis weak and *fragile*, like Arachne's line.

Denham.

—A dry stick will be easily broken, when a green one will maintain a strong resistance; and yet in the moist substance there is less rest than in what is drier and more *fragile*. *Glanville.* 2. Weak; uncertain; easily destroyed.—

Much ostentation, vain of fleshly arms,
And *fragile* arms, much instrument of war,
Long in preparing, soon to nothing brought,
Before mine eyes thou'lt set. *Milt. Par. Reg.*

* **FRAGILITY.** *n. s.* [from *fragile*.] 1. Brittleness; easiness to be broken.—To make an induration with toughness, and less *fragility*, decoct bodies in water for two or three days. *Bacon's N. Hist.* 2. Weakness; uncertainty; easiness to be destroyed.—Fear the uncertainty of man's *fragility*, the common chance of war, the violence of fortune. *Knolles's History.* 3. Frailty; lability to fault.—All could not be right in such a state, in this lower age of *fragility*. *Wotton.*

* **FRAGMENT.** *n. s.* [*fragmentum*, Lat.] A part broken from the whole; an imperfect piece.

He who late a sceptre did command,
Now grasps a floating *fragment* in his hand.

Dryden.

—Cowley, in his unfinished *fragment* of the *Davideis*, has shewn us this way to improvement. *Katts on the Mind.*—If a thin or plated body, which, being of an even thickness, appears all over of one uniform colour, should be slit into threads, or broken into *fragments* of the same thickness with the plate, I see no reason why every thread or *fragment* should not keep its colour. *Newton's Opticks.*—

Some on painted wood

Transfix'd the *fragments*, some prepar'd the food.

Pope's Odyssey.

* **FRAGMENTARY.** *adj.* [from *fragment*.] Composed of fragments. A word not elegant, not in use.—

She, she is gone; she's gone: when thou know'st this,

What *fragmentary* rubbish this world is,
Thou know'it, and that it is not worth a thought;
He knows it too too much that thinks it nought.

Donne.

FRAGNINO, and } Two towns of Naples, in
FRAGNITELLO, } the province of Principato Ultra; the former 8 miles, and the latter 6, from Benevento.

FRAGOA DE S. PEDRO, a town of Portugal, in the province of Beira; 13 m. SSW. of Lamego.

FRAGOAS, a town of Portugal, in the province of Estremadura; 6 miles NW. of

* **FRAGOR.** *n. s.* [Latin.] A noise or crash. Not used.—

Pursu'd by hideous *fragors*, as bel
The flames descend, they in their bre

* **FRAGRANCE.** } *n. s.* [*fragrant*]

* **FRAGRANCY.** } Sweetness of smelling scent; grateful odour.—

Eve separate he spies,
Veil'd in a cloud of *fragrance*, when
Half spy'd. *Milton's*

—I am more pleas'd to survey my row
worts and cabbages springing up in the
grancy and verdure, than to see the ten
of foreign countries kept alive by artifi
Spectator.—

Not lovelier seem'd Narcissus to th

Such was the wine; to quench wh
steam

Scarce twenty measures from the livi
To cool one cup suffic'd: the goblet
Breath'd aromattick *fragrancies* aroun

* **FRAGRANT.** *adj.* [*fragrans*, Latin] Sweet of smell.—

Fragrant the fertile earth
After soft show'rs; and sweet the co
Of grateful evening mild.

The nymph vouchsaf'd to place
Upon her head the various wreath:
The flow'rs, less blooming than her
Their scent, less *fragrant* than her bre

* **FRAGRANTLY.** *adv.* [from *fragrant*] Sweetly. —As the hops begin to chan
and smell *fragrantly*, you may conclude
Mortimer's Husbandry.

FRAGUIER, Claude Francis, a polite
ed French writer, born at Paris, of a no
in 1666. He was educated under the J
was admitted into their order, but after
ted it; and, soon after assisted the Ab
in conducting the *Journal des Sçavans*.
tings consist of Latin poems, and many
dissertations. He died in 1728.

(1.) * **FRAIL.** *adj.* [*fragilis*, Latin.] Easily decaying; subject to casualties; destroyed.—

I know my body's of so *frail* a kin
As force without, severs within can kil
—When with care we have raised an
treasure of happiness, we find, at last, th
terials of the structure are *frail* and peri
the foundation itself is laid in the san
2. Weak of resolution; liable to errou
tion.—The truly virtuous do not easily
that is told them of their neighbours; fo
may do amiss, then may these also sp
man is *frail*, and prone to evil, and the
soon fail in words. *Taylor.*

(2.) * **FRAIL.** *n. s.* 1. A basket made
2. A rush for weaving baskets.

(3.) **FRAIL** signifies also 75 lb. of raisi
* **FRAILNESS.** *n. s.* [from *frail*] In

—There is nothing among all the *frail*-uncertainties of this sublunary world so and unstable as the virtue of a coward.

S. in geography, rocks of Ireland, on the Wexford, 12 m. SW. of Carnfore Point. *ILTY*. *n. f.* [from *frail*.] 1. Weakness of ; instability of mind ; infirmity.—'Tho' secure foot, and stands so firmly on his *ility*, yet I cannot put off my opinion so *ake* *spears*.—

thould'st thou have trusted that to we-
an's *frailty* :

o thee, thou to thyself wast cruel.

Milton's Samson Agonistes.

nows our *frailty*, pities our weakness,
ires of us no more than we are able to
e. 2. Faults proceeding from weakness ;
firmity : in this sense it has a plural.—

Love did his reason blind,
ve's the noblest *frailty* of the mind.

Dryden's Indian Emperor.

ind wits will those light faults excuse ;
are the common *frailties* of the muse.

Dryden.

th. only death, can break the lasting chain ;
ere, ev'n then, shall my cold dust remain ;
all its *frailties*, all its flames resign,
art, 'till 'tis no sin to mix with thine. *Pope*.
Christians are now not only like other men
frailties and infirmities, might be in some
excusable ; but the complaint is, they are
thers in all the main and chief articles of
re. *Law*.

LAISCHEUR. *n. f.* [Fr.] Freshness ; cool-
A word foolishly innovated by *Dryden*.—
ther in Summer-ev'nings you repair,
aste the *fraischeur* of the purer air. *Dryd*.

FRAISE. *n. f.* [Fr. the caul of an animal.]
ake with bacon in it.

FRAISE, in fortification, a kind of defence,
ng of pointed stakes, six or seven feet long,
parallel to the horizon into the retrench-
of a camp, a half-moon, or the like, to pre-
approach or escalade. Fraises differ from
chiefly in this, that the latter stand per-
ular to the horizon, and the former jet out
to it, or nearly so, being usually made a
loping, or with the points hanging down.
are chiefly used in entrenchments and other
rown up of earth ; sometimes they are
nder the parapet of a rampart, serving in-
sthe cordon of stone used in stone works.

FRAISE, in geography, a town of France,
dept. of Volges ; 6 miles S. of South Diey,
of E. of Bruyeres.

FRAISE A BATTALION, is to line the mus-
round with pikes, that in case they should
aged with a body of horse, the pikes being
sted may cover the soldiers from the shock,
tre as a barricade.

FRAMBANT SUR PISSE, a town of France,
dept. of Maine, 9 miles NNW. of Laffay.

* FRAME. *n. f.* [from the verb.] 1. A fa-
; any thing constructed of various parts or
ers.—If the *fram* : the heavenly arch should
re itself, if celestial spheres should forget their
ed motions, and by irregular volubility turn

themselves any way, as it might happen. *Hooker*.—
Castles made of trees upon *frames* of timber, with
turrets and arches, were anciently matters of mag-
nificence. *Bacon*.—

These are thy glorious works, parent of good !
Almighty ! thine this universal *frame*. *Milton*.

Divine Cecilia came,
Inventress of the vocal *frame*. *Dryden*.

The gate was adamant ; eternal *frame*,
Which, hew'd by Mars himself, from Indian
quarries came,

The labour of a god ; and all along
Tough iron plates were clench'd to make it
strong. *Dryden*.

—We see this vast *frame* of the world, and an in-
numerable multitude of creatures in it ; all which
we, who believe a God, attribute to him as the
author. *Tillotson*. 2. Any thing made so as to in-
close or admit something else.—Put both the tube
and the vessel it leaned on into a convenient wood-
en *frame*, to keep them from mischances. *Boyle*.
His picture scarcely would deserve a *frame*.

Dryden's Juv.

—A globe of glass, about eight or ten inches in
diameter, being put into a *frame* where it may be
swiftly turned round its axis, will, in turning,
shine, where it rubs against the palm of one's
hand. *Newton's Opticks*. 3. Order ; regularity ;
adjusted series or disposition.—

A woman, that is like a German clock,
Still a-repairing, ever out of *frame*,
And never going aright. *Shakespeare*.

Your steady soul preserves her *frame* ;
In good and evil times the same. *Swift*.

4. Scheme ; order.—Another party did resolve to
change the whole *frame* of the government in state
as well as church. *Clarendon*. 5. Contrivance ;
projection.—

John the Bastard,

Whose spirits toil in *frame* of villanies. *Shak*.
6. Mechanical construction. 7. Shape ; form ;
proportion.—

A bear's a savage beast,

Whelp'd without form, until the dam
Has lick'd it into shape and *frame*. *Hudibras*.

(2.) FRAME is also used for a sort of loom,
whereon artificers stretch their linens, silks, stuffs,
&c. to be embroidered, quilted, or the like.

(3.) FRAME, among founders, a kind of ledge,
which, being filled with wetted sand, serves as a
mould to cast their works in. See FOUNDERY, § 4.

(4.) FRAME, in joinery, a kind of case, wherein
a thing is set or inclosed, or even supported ; as a
window frame, a picture frame, &c.

(5.) FRAME, among painters, a kind of square,
consisting of 4 long slips of wood joined together,
whose intermediate space is divided by threads in-
to several little squares like a net ; and hence some-
times called *reticula*. It serves to reduce figures
from great to small ; or, on the contrary, to aug-
ment their size from small to great.

(6.) FRAME, among printers, is the stand which
supports the cases. See CASE, § 4.

* To FRAME. *v. a.* 1. To form or fabricate by
orderly construction and union of various parts.—

The double gates he findeth locked fast ;
The one fair *fram'd* of burnish'd ivory,
The other all with liver overcast. *Spenser*.

2. To

2. To fit one to another.—They rather cut down their timber to *frame* it, and to do necessities to their convenient use, than to fight. *Abbot*.—Hew timber, saw it, *frame* it, and set it together. *Mart*.

3. To make; to compose.—

Then chusing out few words most horrible,
Thereof did verses *frame*. *Spenser*.

Fight valiantly to-day;
And yet I do thee wrong to mind thee of it;
For thou art *fram'd* of the firm truth of valour.

Shakespeare.

4. To regulate; to adjust.—Let us not deceive ourselves by pretending to this excellent knowledge of Christ Jesus our Lord, if we do not *frame* our lives according to it. *Tillotson*. 5. To form to any rule or method by study or precept.—

Thou art their soldier, and, being bred in
broils,

Hast not the soft way; but thou wilt *frame*
Thyself forsooth hereafter theirs. *Shak. Coriol.*

I have been a truant to the law;
I never yet could *frame* my will to it,
And therefore *frame* the law unto my will.

Shakespeare.

6. To form and digest by thought.—The most abstruse ideas are only such as the understanding *frames* to itself, by joining together ideas that it had either from objects of sense or from its own operations about them. *Locke*.—

Full of that flame his tender scenes he warms,
And *frames* his goddess by your matchless
charms. *Granville*.

Urge him with truth to *frame* his sure replies.

And sure he will; for wisdom never lies. *Odyssey*.

—How many excellent reasonings are *framed* in the mind of a man of wisdom and study in a length

of years. *Watts*. 7. To contrive; to plan.—Unpardonable the presumption and insolence in contriving and *framing* this letter was. *Clarendon*.—

8. To settle; to scheme out.—

Though I cannot make true wars,
I'll *frame* convenient peace. *Shak. Coriolanus*.

9. To invent; to fabricate, in a bad sense; as, to *frame* a story or lie.—Astronomers, to solve the phenomena, *framed* to their conceit eccentricks and epicycles. *Bacon*.

FRAMECOURT, a town of France in the dep. of the Straits of Calais; $4\frac{1}{2}$ miles S. of St Pol.

* FRAMER. *n. s.* [from *frame*; *fremman*, Sax.] Maker; former; contriver; schemer.—The forger of his own fate, the *framer* of his fortune, should be improper, if actions were predetermined. *Hammond*.—There was want of accurateness in experiments in the first original *framer* of those medals. *Arbuthnot on Coins*.

FRAMESDEN, a town in Suffolk.

FRAMFIELD, a village in Suffolk.

FRAMINGHAM, a town SE. of Norwich.

FRAMLINGHAM, a large and ancient town of Suffolk. It has the remains of a castle, built by one of the first kings of the East Angles. Its walls, which are still to be seen, are 24 feet high, and 8 thick; and have 13 towers, 14 feet each above the walls. Two of them are watch-towers. To this castle, Mary Tudor, afterwards Q. Mary I, retired, when the unfortunate Lady Jane Gray was proclaimed queen. See ENGLAND, § 40.

Framlingham has a stately church, built of black

flint, with a steeple 100 feet high, and market place; with a weekly market on and 2 fairs, in May and Sept. It is pleated, upon a clay hill near the source of 18 miles NE. of Ipswich, 30 E. of Bury NNE. of London. Lon. 1. 26. E. Lat.

* FRAMPOLD. *n. s.* [This word is Dr Hacket, *frampul*. I know not its Peevish; boisterous; rugged; crossgrained husband! Alas, the sweet woman leads with him: she leads a very *frampold* life. *Shak*.—The *frampul* man could not be. *Hacket's Life of Williams*.

(1.) FRAMPTON, or FROMETON, England, in Dorsetshire, on the Frome WNW. of Dorchester, 12 NW. of W and 126 NE. of London. Lon. 2. 50. W 45. N.

—(2-4.) FRAMPTON is also the name of small towns, in Berks, Lincoln, and Cheshire.

(5, 6.) FRAMPTON UPON SEVERN, Gloucestershire, between Berkley and F and a parish which extends 8 miles in length; bounded by the Stroud on the Berkley on the S. and the Severn on the N. The tide comes up in a straight line for length with great rapidity, till it comes to a main Nob, a natural Bulwark, which torrent to the E. and by N. of Frampton.

FRANC. See FRANK, § IV.

FRANCAISE PORT, a port and bay on the coast of Brasil. Lon. 17. 0. W. of Pernambuco. S.

FRANCASTEL, a town of France, in the dep. of Oise, 5 miles SW. of Breteuil.

FRANCAVILLA, the name of five towns in Naples: viz. 1. in the province of Abruzzo, 9 miles NE. of Chieti: 2. in that of Basilicata, 9 miles SW. of Turis: 3. in Calabria Citra, NE. of Cassano: 4. in Calabria Ultra, WSW. of Squillace: and, 5. in Otranto NW. of Oria.

(I. 1.) FRANCE, an extensive country, for many ages a kingdom, but at present a republic: situated between 5° W. and 7° E. and between 43° and 51° N. Lat. Before the present war, it was bounded by the English Channel and the Austrian Netherlands on the N. Germany, the Alps, Switzerland, Savoy, and Piedmont, on the E.; by the Mediterranean Sea on the S.; and by the Atlantic Ocean on the W.

(2.) FRANCE, AIR, CLIMATE, SOIL, &c. DUCE OF. The air of France is pure, temperate, and healthy. It is so happily situated in the middle of the temperate zone, that some reckon it equal to Italy, both with regard to its scenery and the fertility of the soil. The climate is undoubtedly much more salubrious. It produces corn, wine, oil, flax, fruits, &c. in great abundance.

(3.) FRANCE, ANCIENT GOVERNMENT. Before the revolution it was absolute monarchy: the subjects were extremely oppressed, even under the greatest appearance of moderation. The parliaments, for a long time past, had little or no share in the

and their business was confined to the passing and registering the arrets or laws which the king issued to them. However; they did not always render obedience to the king, and there have been many instances of their making a very spirited opposition. In civil causes they were the last to be decided, the court did not interpose. The king of Paris was the most considerable, and the king used often to come in person to the great assembly recorded. It consisted of the great peers of France, besides the ordinary judges, who purchased their places; and they had cognizance of causes belonging to the king. The revenues of the crown arose from the royal land tax, and the aids which proceeded from customs and duties on all merchandize, and salt, the tax upon which commodity was the *gabelle*. See GABEL. Besides these, there were other taxes, as, the capitation or poll-tax, tenths of all estates, offices, and employments, besides the 15th penny, from which neither nobility nor clergy were exempted; the tithes of the clergy, who were also taxed themselves; and, lastly, crown rents, and forfeitures, which brought in a considerable sum. All these are said to have amounted to 200,000 *l.* sterling a-year. But the king had various other ways of raising money, when necessity obliged him.

FRANCE, ANCIENT HISTORY OF, FROM THE CONQUEST OF GAUL, TO THE ACCESSION OF CLOVIS. France was originally possessed by the *Celts* or *Gauls*; a very warlike people, who checked the progress of the Roman empire, and did not yield till Julius Cæsar totally subdued their country, and reduced it to the form of a Roman province. See GAUL. The Romans held in quiet possession of Gaul, as long as the empire retained sufficient strength to repel the incursions of the German nations, whom they were able to subdue. But in the reign of Valerian, the ancient Roman valour and discipline had declined, and the same care was not taken to defend the provinces. The barbarous nations, therefore, began to make much more frequent incursions; and among the rest the FRANKS, a warlike nation, inhabiting the banks of the Rhine, proved particularly troublesome. Their origin is variously accounted for; but the most probable account is, that about the time of the reign of Gordian, the people inhabiting the banks of the lower Rhine entered into a confederacy with the *Saxons* who dwelt on the *Weiser*, and assumed the name of *Franks*, or *Freemen*. Their first invasion, according to Valesius, happened A. D. 247, in the third year of Valerian's reign; when they were repulsed by Aurelian, afterwards emperor. They returned two years after in far greater numbers; and were again defeated by Gallienus, Valerian's son and successor. Others, however, contend that Gallienus engaged one of their kings to defend the frontiers against his countrymen, and other invaders. But in A. D. 260, when the emperor was in Persia, again ravaged Gaul, and entered Italy. In 275, they were driven out of Gaul by Probus, by whose victorious and generous treatment, 9 of their kings submitted to him, and promised an annual tribute.—They continued quiet till A. D. 287; when, along with the Saxon pirates, they plundered the coasts of Gaul. To revenge this insult, the emperor Maximian entered the country of the Franks the following year, and obliged two of their kings to submit to him. The Franks, however, did not remain long in peace. About the year 293, they seized Batavia and part of Flanders; but were entirely defeated by Constantius Chlorus, who transplanted them into Gaul. All these victories, however, were not sufficient to prevent the incursions of this restless and turbulent nation; insomuch that, in 355, they had made themselves masters of 40 cities in Gaul. Soon after, they were totally defeated by Julian, and again by count Theodosius, father to the emperor; but, in 388, they ravaged the province with more fury than ever. As the western empire was at this time in a very low state, they for some time found more interruption from other barbarians than from the Romans, till their progress was checked by Aetius. At this time, the Franks were governed by one *Pharamond*, the first of their kings of whom we have any distinct account. He is supposed to have reigned from A. D. 417 or 418, to 428; and is thought by Abp. Usher to have been killed in the war with Aetius. By some he is said to have compiled the *Salic Laws*, with the assistance of four counsellors, named *Hildigast*, *Lothgast*, *Witegast*, and *Schepast*. Pharamond was succeeded by his son Clodio, who likewise carried on a war against the Romans.

(5.) FRANCE, HISTORY OF, FROM CLOVIS THE GREAT. Clodio is said to have received a terrible overthrow from Aetius, near the city of Lens; however, he advanced to Cambray, where he for some time took up his residence. After this he destroyed the cities of Treves and Cologne, Tournay, and Amiens. He died in 428, and was succeeded by Meroveus. Whether the new king was related to Clodio, is not certain. From him the first race of French kings were called *Merovingians*. He was respected by his people, and died in 438. Meroveus was succeeded by his son Childeric; who made war on the Romans, and proceeded as far as the river Loire. He took the city of Paris after a siege of 5, some say 10 years. The Roman power was now totally destroyed in Italy; and therefore Clodomer, Clodio's son, or Louis, who succeeded Childeric, attempted the entire conquest of Gaul. Part of the province was still retained by a Roman named *Syagrius*, who was defeated and killed, and his dominions reduced, by Clovis. Thus was the French monarchy established by Clovis in the year 487.

(6.) FRANCE, HISTORY OF, FROM CLOVIS'S ESTABLISHMENT OF THE FRENCH MONARCHY, TO HIS DEATH. Clovis now possessed all the country lying between the Rhine and the Loire. He had been educated in paganism; notwithstanding which he allowed his subjects full liberty of conscience. He married Clotilda, daughter of the duke of Burgundy, who was a Christian; and, happening to gain a battle, where, being in great danger, he had invoked the god of Clotilda and the Christians, he soon declared himself a convert, and was baptised in 496. But his profession of Christianity was not followed by any amendment

of life: he spent the remainder of his life in aggrandizing himself and extending his dominions, by the most abominable treachery and violence. In his attacks on Armorica he proved unsuccessful. The inhabitants of that country, though abandoned by the Romans, united together, and made a powerful defence against the barbarians who assaulted them on all sides. Clovis, finding them too powerful, proposed an union, which they accepted, the more readily as he professed Christianity. Burgundy at this time extended from the forest of Vosges to the sea of Marseilles, under Gondebald, the uncle of Clotilda; who had killed two of his brothers, one of them the father of the French queen. The 3d brother, Godagesil, whom he had spared and allowed to possess Geneva, conspired with Clovis to drive him from his dominions. A war having commenced between the French and Burgundian monarchs, the latter was deserted by Godagesil, and fled to Avignon, leaving his antagonist master of Lyons and Vienna. The victor next besieged Avignon; but it was defended with such vigour, that Clovis accepted of a ransom, and an annual tribute from Gondebald; who was likewise obliged to cede to Godagesil, Vienne and several other places. Gondebald was no sooner at liberty than he assembled a powerful army, and advanced towards Vienne, where Godagesil resided. It was strongly garrisoned by 5000 Franks; but Gondebald being admitted through an aqueduct, massacred most of the Franks, sent the rest prisoners to the king of the Visigoths, and put Godagesil to death. All the other places speedily submitted: and Gondebald, now thinking himself able to resist Clovis, informed him, that he must no longer expect tribute; Clovis, though much mortified with this defection, put up with the injury, and accepted of the alliance of the king of Burgundy. He next attacked the Visigoths, who had possessions on both sides of the Pyrenees, and whom he attacked under pretence of zeal for the true religion. To his nobles, assembled at Paris, he said, "It is with concern that I suffer the ARIANS to possess the most fertile part of Gaul; let us, with the aid of God, march against them; and having conquered them, annex their kingdom to our dominions." The nobility approved, and Clovis attacked a prince for whom he had but lately professed the greatest regard, vowing to erect a church in honour of the holy apostles, if he succeeded. Alaric, king of the Visigoths, was a young man of no military experience, though personally brave. He did not therefore hesitate to engage his antagonist; but his army was utterly defeated on the banks of the Clain, 10 miles S. of Poitiers; A. D. 507. Alaric rushed desperately against Clovis in person, by whom he was killed, and his army pursued with great slaughter. Aquitaine now submitted, and Clovis took up his winter quarters at Bourdeaux. Tholouse surrendered next spring; and the royal treasures of the Visigoths were transported to Paris. Angouleme was next reduced, and Arles invited. But here the victorious career of Clovis was stopped by Theodoric king of the Ostrogoths, who had overthrown Odoacer in Italy. He had married Abolfleda Clovis's sister, and given his own daughter to the king of the Visi-

goths, and endeavoured to preserve standing between the two sovereigns; but finding this impossible, he sent one of his powerful army against Clovis; who, with the loss of 30,000 men. Clovis obliged to raise the siege of Arles: Franks still retained the greatest part of the conquests, and Aquitaine was indissolubly united to their empire. In 509, Clovis was vested with the title of Roman emperor, and the church of St Martin in Tours; after entering the cathedral clothed in a purple mantle, the badges of his consular rank, then proceeded to augment his power by giving to his kinsmen the princes of the race. Among those who perished was Sigismund king of Cologne, his son Cloderic; and Meneval, who governed the country of the *Cambresis*; and Renomer king of the *Maine*. All these murders, however, were atoned by his zeal and liberality to the people. He died in 511, after having reformed the Salique laws: a few lines of which prohibited women from inheriting any part of the lands, were extended so far as to disinherit the males of the royal family of France of succession to that kingdom. Clovis lies in the church of St Genevieve, in Paris; his tomb is still to be seen.

(7.) FRANCE, HISTORY OF, FROM THE DEATH, TO THAT OF CLOTAIRE I. Clovis's dominions were divided among his 4 sons; Theodoric, the eldest, had the eastern part of the empire; and, from his making Metz his capital, is commonly called *Metz*. Clodomir, the eldest son by Clotilda; Childebert and Clotaire, both infants, had the kingdoms of Paris and Orleans, under the tutelage of their mother. The prudence of Clotilda kept matters quiet in the empire for 8 years; but about 529 a numerous fleet of Danes arrived at the mouth of the Meuse; and their king Cochise landed his forces, began to destroy the country with fire and sword. Against him his son Theodobert, who defeated them by land and navy, and killed their king, sent them to retire with precipitation. In 531, Ermanfrid, king of Thuringia, having destroyed his brethren named *Berthaire*, and his dominions, applied to Thierry for assistance. His other brother Balderic, whom he had treated in the same manner. In this interprise Thierry embarked, on condition that he should have one half of Balderic's dominions after Balderic was overcome and killed. Ermanfrid seized all his dominions, and had no opportunity of revenging himself till 536, perceiving the power of the Ostrogoths, whom he much dreaded, to be considerably increased by the death of king Theodoric, he engaged Clotaire to assist him. They entered Thuringia with two powerful armies, and ed their forces after passing the Rhine. They quickly after reinforced by a considerable number of troops under the command of Theodobert, allies attacked the army of Ermanfrid, who was advantageously posted; and having

was forced to fly from place to place in distress. Soon after this the capital was taken, and Hermanfroi himself, being invited to a conference by Thierry, was treacherously murdered; and his extensive dominions became feudatory to Thierry. In the mean time, Clotilda excited her sons to make war on the Burgundians, to revenge the death of her father Chilperic, whom Gondebald had murdered. Gondebald was now dead, and had left his dominions to his sons Sigismund and Godemar. Sigismund's forces were quickly defeated; and himself delivered up to Clodomir, who threw him into a pit, where he perished. Godemar thus became master of Burgundy. Clodomir defeated him, but pursuing too eagerly, was surrounded by his enemies and slain. After the reduction of Thuringia, however, Childebert and Clotaire entered Burgundy with a powerful army, and in 534 completed the conquest of it; Godemar was killed; others say, he retired into Spain, and thence into Africa. In 560 Clotaire became monarch of France. He had murdered the sons of Clodomir. Thierry and his children were dead, as was also Childebert; so that Clotaire was sole heir to all the dominions of Clovis. He had 5 sons; and Chramnes had some time before rebelled in Auvergne. While Childebert lived, he supported the young prince; but on his death, Chramnes implored his father's clemency. He was at this time pardoned; but soon after engaged the count of Bretagne to assist him in another rebellion. The Bretons, however, were defeated, but Chramnes, perceiving his wife and children surrounded by his father's troops, attempted to rescue them. He was taken prisoner, and with his family thrust into a thatched cottage near the field of battle; which when the king heard of, he commanded the cottage to be set on fire, and they all perished in the flames. Clotaire did not long survive this cruel execution of his son and grand-children, but died in 562.

(8. FRANCE, HISTORY OF, FROM CLOTAIRE I'S DEATH, TO THAT OF CLOTAIRE II. After Clotaire's death, the empire was divided among his 4 remaining sons, Caribert, Gontran, Sigebert, and Chilperic.—The old king had made no division of his dominions before he died. They therefore divided them by lot; Caribert had Paris; Gontran, Orleans; Sigebert, Metz, or Austrasia; and Chilperic, Soissons. Provence and Aquitaine were possessed in common. Peace was first disturbed in 565, by the *Abares*; a barbarous nation, said to be the remains of the Huns. They entered Thuringia, belonging to Sigebert; who selected and obliged them to repass the Elbe. Sigebert pursued them close, but quickly concluded a peace with them; his brother Chilperic having invaded his dominions, and taken Rheims and some other places. Against him, therefore, Sigebert marched, made himself master of Soissons his capital, and of his eldest son Theodobert. He then defeated him in battle; and not only recovered the place which he had seized, but overran the greater part of his dominions: by the mediation of the other two brothers, Sigebert abandoned his conquests, set Theodobert at liberty, and thus restored peace. Soon after, Sigebert married Brunehaut daughter to Athanagild king of the Visigoths

in Spain; and his brother Caribert, king of Paris, died, whose dominions were divided. In 567 Chilperic married Galswintha, Brunehaut's eldest sister, whom he obtained with some difficulty. Before her arrival, he dismissed his mistress, *Fredegonde*, a woman of great abilities, very ambitious, and capable of the blackest crimes. The new queen, who brought immense treasures from Spain, and made it her whole study to please the king, was for some time entirely acceptable. However, Chilperic gradually suffered Fredegonde to appear at court, and was suspected of having renewed his intercourse with her; which so hurt the queen, that she desired leave to return to Spain, offering to leave all her wealth. The king, knowing that this would render him extremely odious, quieted her suspicions, and soon after caused her to be privately strangled; upon which he publicly married Fredegonde. This atrocious action excited the greatest indignation. His dominions were quickly invaded and conquered by Sigebert and Gontran; after which they made peace, Chilperic consenting that Brunehaut should enjoy those places which he had bestowed upon Galswintha, viz. Bourdeaux, Limoges, Cahors, Bigorre, and Bearn, now called *Lescar*. The French princes were not long at peace. A war quickly commenced; Gontran and Chilperic coalesced against Sigebert. The latter prevailed; and compelling Gontran to a separate peace, seemed determined to make Chilperic pay dear for his repeated perfidy; but he was assassinated by order of Fredegonde, who thus preserved herself and Chilperic. On his death, Brunehaut fell into the hands of Chilperic; but Gondebald, one of Sigebert's best generals, escaped into Austrasia with Childebert, the only son of Sigebert, about 5 years of age, who was proclaimed king. In a short time, however, Meroveus, eldest son to Chilperic, fell in love with Brunehaut, and married her privately. Chilperic immediately went to Rouen, where Meroveus and his consort were; and having seized them, sent Brunehaut and her two daughters to Metz, and carried Meroveus to Soissons. Soon after, one of his generals being defeated by Gontran, who espoused Brunehaut's cause, Chilperic, in a fit of rage, caused Meroveus to be shaved and sent to a monastery. From hence, however, he escaped, and arrived in Austrasia; but the jealousy of the nobles forced him to leave that country; and being betrayed into the hands of his father's forces, he was murdered at the instigation of Fredegonde. France was at this time divided between Gontran king of Orleans and Burgundy, Chilperic king of Soissons, and Childebert king of Austrasia. Chilperic, in 579, had a dispute with Varc count of Bretagne, Chilperic dispatched a body of troops against him; who were defeated, and he was forced to submit to a dishonourable peace. His brother and nephew lived in strict union, and had no reason to be pleased with him. His subjects were oppressed, poor, and discontented. His son Clovis, by his former marriage, avowedly hated Fredegonde. To crown all, the country was threatened with famine and pestilence. The king and queen were both attacked by an epidemic disease. They recovered, but their 3 sons, Clodobert, Samson,

quitain. Pepin now at peace, began to think of assuming the title of *king*. His wishes were agreeable to the nation. The nobility, however, were bound by an oath of allegiance to Childeric, and this oath could not be dispensed with, but by the pope's authority. Ambassadors were therefore dispatched to pope Zachary. His holiness replied, that it was lawful to transfer the regal dignity from hands incapable of maintaining it to those who had so successfully preserved it. On this the unfortunate Childeric was shaved, and confined in a monastery for life; Pepin assumed the title of *king of France*, and the Merovingian line was finally set aside.

(12.) FRANCE, HISTORY OF, FROM CHILDERIC'S DEPOSITION TO THE DEATH OF PEPIN AND ACCESSION OF HIS SONS. This revolution took place in 751. Pepin's attention was first claimed by a revolt of the Saxons; whom he soon reduced. During his expedition against them he got rid of his restless and treacherous brother Grippon; who, weary of Aquitain, fled to Astolphus king of the Lombards, but was killed in attempting to force a pass on the confines of Italy. The submission of the Saxons was followed by the reduction of Brittany, and the recovery of Narbonne from the Infidels. Pepin's next exploit was the protection of pope Stephen III. against Astolphus, king of the Lombards. The pope, unable to contend with such a powerful rival, crossed the Alps and implored the protection of Pepin, who received him with all due respect. He was lodged in the abbey of St Dennis, and attended by the king in person during a dangerous sickness with which he was seized. On his recovery Stephen solemnly placed the diadem on the head of his benefactor, bestowed the regal sanction on his sons Charles and Carloman, and conferred on the three princes the title of *patrician of Rome*. In return for these honours, Pepin accompanied the pontiff into Italy at the head of a powerful army. Astolphus shut himself up in Pavia, where he was closely besieged by the Franks, and obliged to renounce all pretensions to the sovereignty of Rome. No sooner was Pepin gone, however, than Astolphus broke the treaty. The pope was again reduced to distress, and again applied to Pepin; who instantly set out for Italy, and compelled Astolphus a 2d time to submit to his terms, which were now more severe. Not long after Astolphus died, and his throne was usurped by his general Didier; who received the papal sanction, and was recognised as lawful sovereign of the Lombards in 756. Pepin returned to France in triumph; but his peace was soon disturbed by another revolt of the Saxons. But their attempts proved as unsuccessful as formerly, being obliged to submit and purchase their pardon by a renewal of their tribute, and an additional supply of 300 horse. During Pepin's absence, Vaisar duke of Aquitain ravaged Burgundy, and proceeded as far as Chalons. Pepin soon returned, and entering his dominions, committed similar devastations, and would probably have reduced all Aquitain, but for the hostile preparations of his nephew Tassilon, duke of Bavaria. The king, however, contented himself with securing his frontiers by a chain of posts, against any invasion;

after which he resumed his enterprize on the minions of Vaisar. Victory declared in favor of Pepin, who advanced to the banks of the Rhine; while Vaisar was abandoned by the duke of Bavaria, and even by his own subjects. In distress he retired with a few faithful followers into Saintonge, where he defended himself as long as possible, but was at last deprived of his crown and life by the victor. Thus Aquitain was more annexed to the crown of France. Pepin was soon after seized with a slow fever, which put an end to his life in 768, the 54th of his age and 17th of his reign. He was of a short stature whence he was surnamed *Le Bref*, or *the Short*; he was justly intitled a HERO: though in the succeeding reign this seemed to be forgotten, and his tomb was only inscribed, "Here lies the father of Charlemagne." Pepin was succeeded by his two sons, Charles and Carloman.

(13.) FRANCE, HISTORY OF, FROM CHARLES'S ACCESSION, TO HIS CONQUEST OF LOMBARDY. Pepin's sons continued to reign jointly some time; but the active and enterprising Charles gave umbrage to the weak and jealous Carloman. The first enterprize of Charles was against Hunald, the old duke of Aquitain; leaving the monastery where he had resided upwards of 20 years, assumed the royal title, and was joyfully received by his subjects, already weary of the French yoke. Charles quickly entered the field, and with difficulty prevailed upon his brother Carloman, to join him with his forces. But the junction was scarce effected, when Carloman suddenly withdrew his troops. Charles though thus deserted, engaged and overcame his enemy in a great battle, and obliged Hunald to flee to Lupus duke of Gascony. Charles demanded the fugitive prince; and Lupus, not daring to disobey such a powerful monarch, yielded up Hunald to the French. The death of Carloman, in 771, made Charles sole master of France; but the revolt of the Saxons involved him in a series of wars for many years. They had long been tributaries to the French, and now, when freed from the terror of Pepin's arms, thought to shake off the yoke altogether. Charles entered their country with a powerful army; and having repeatedly defeated them, advanced towards their chief station, the town of Paderborn. The Saxons made an obstinate defence, but were at last obliged to submit; and Charles spent three days in demolishing the monuments of idolatry in this place; which so much disheartened the whole nation, that they submitted to such terms as he pleased to impose. Charles had concluded a marriage with the daughter of Didier, king of the Lombards, who had seized and frightened to death pope Stephen III. and endeavoured to reduce his successor Adrian I. to a state of entire dependance on himself. Adrian applied to the French monarch. The French nobles were averse to an Italian war: so that several embassies were sent to Didier, entreating him to restore to the pope those places which he had taken from him, and at last even offering him a large sum of money if he would do so; but this proposal being rejected, Charles obtained the consent of his nobility to make war on the Lombards.

sed of his troops so advantageously, that officers were of opinion, that it would be able to force a passage. This, however, accomplished, either through his superior a panic which seized the Lombard soldier which, Didier, with the old duke of , who had escaped from his prison, and sage at his court, shut themselves up in Adalgise, the only son of Didier, with the and children of Carloman, fled to Verona. ty was immediately invested by the con- and soon submitted. This revolt was owing to a chief itikind, who had twice before fled from

Charles, to the court of Denmark. Returning in the king's absence, he roused his countrymen to action, while Charles's generals, disagreeing among themselves, took no proper method for repelling the enemy. In consequence of this, they were entirely defeated on the banks of the Weser in 782. Charles arrived in time to prevent the total destruction of his people, and directly penetrated into the heart of the country. Witikind once more fled into Denmark; but 4,500 of his followers perished at once by the hands of the executioner. An universal insurrection was the consequence of this unheard of cruelty; and though during 3 years Charles was constantly successful in the field, he could not subdue the spirit of the people. At last he was obliged to negotiate. Witikind and several other chiefs were invited to an interview; where Charles represented to them in such strong colours the ruin which must ensue to their country, that they persuaded their countrymen finally to submit, and embrace the Christian religion.

(15.) FRANCE, HISTORY OF FROM CHARLES- MAGNE'S CONQUEST OF THE SAXONS, TO HIS CORONATION AS EMPEROR. Charles having thus brought his affairs in Saxony to a conclusion, turned his arms against Tassilon duke of Bavaria, who had privately supported the Saxons. Entering his country with a powerful army in 787, the total destruction of Tassilon seemed inevitable. Charles had advanced as far as the Lech, where Tassilon, privately entering his camp, threw himself at his feet. The king had compassion on his faithless kinsman, but no sooner was the traitor at liberty, than he stirred up the Hunns, the Greek emperor, and the fugitive Adalgise, against the king. He fomented also the discontents of Aquitain and Lombardy; but his own subjects, made a discovery of the whole to Charles. Tassilon, ignorant of this, entered the diet at Ingelheim, but was instantly arrested by order of the French monarch. Being brought to a trial, the proofs of his guilt were so clear, that he was condemned to lose his head: this was afterwards mitigated to perpetual confinement in a monastery, and the duchy of Bavaria was annexed to the dominions of Charles. The Hunns, however, and other enemies of the French monarch continued to prosecute their enterprises, though all their attempts only served to enhance the fame of Charles. He defeated the Hunns in Bavaria, and the Greek emperor in Italy. The Hunns still continuing to infest the French dominions, Charles entered their country at the head of a formidable army and penetrated as far as Raal on the Danube, but was compelled by an epidemic distemper to retire before he had finished his conquest. He had now the mortification to learn that his eldest son Pepin had conspired against him. The plot was discovered by a priest, who had accidentally fallen asleep in a church where the conspirators were met: awakened by their voices, he overheard their consultations; on which he instantly awoke the monarch from his bed, to inform him. Pepin was seized, but had his life spared, though condemned to spend the rest of his days in a monastery. Charles was no sooner freed from this danger than he was again called to arms by a revolt of the Saxons on

the one hand, and a formidable invasion of the Moors on the other; the Hunns at the same time renewing their depredations on his dominions. The king did not at this time make war against the Moors; the victories of Alphonso VI. obliged them to leave France; after which Charles marched in person to attack the Saxons and Hunns. The former consented again to embrace Christianity, and to deliver up a third part of their army; but the Hunns defended themselves with incredible valour. Though often defeated, their love of liberty was altogether invincible; so that it was only the death of the king, and an almost total destruction of the people which terminated the war: only one tribe could be induced to acknowledge the authority of the French monarch. This happened between the years 793 and 798; after which Charles subdued the islands of Majorca and Minorca. His satisfaction from this new conquest, however, was soon damped by the troubles which broke out in Italy. After Adrian I's death his nephew aspired to the dignity; but one Leo being preferred, he determined on revenge. He concealed his designs for 4 years, till on the day of a procession, Leo was assaulted, and left for dead on the ground; but having with difficulty recovered, and escaped to the Vatican, he was protected by the duke of Spoleto, at that time general of the French forces. Leo's cause was espoused by Charles, who invited him to his camp, whence he dispatched him with a numerous guard to Rome, promising soon to follow him and redress all grievances. But the Normans having made inroads into the maritime provinces, he was obliged to defer the promised assistance, till he had constructed forts at the mouths of the navigable rivers, and provided for the defence of his territories, by instituting a militia, and appointing squadrons to cruise against the invaders: after which he set out for the 4th and last time on a journey to Rome, where he was received with the highest possible honours. Leo cleared himself of the crimes laid to his charge by his enemies, while his accusers were exiled. At last, on Christmas, A. D. 800, when Charles appeared in the cathedral of St Peter, and assisted devoutly at mass, the pope suddenly crowned him, and the place instantly resounded with "Long life to Charles the August, crowned by the hand of God! Long life and victory to the great and pacific emperor of the Romans!" He was then consecrated and anointed with royal unction; and conducted to a throne where he was treated with all the respect usually paid to the ancient Cæsars; from this time also being honoured with the title of CHARLEMAGNE, or *Charles the Great*. He afterwards often said, that he was ignorant of the pope's intention at this time; and that, had he known it, he would not have been present; but this was not generally believed; and the desire to have been known to be acknowledged by the other emperors, evidently showed how far he was from it.

34. *FRANKS, HISTORY OF, FROM CHARLEMAGNE'S DEATH TO THE PRESENT.* Charles, now Charles the Great, retained the same dignity in the west, and by the conquest of a whole part of the East, by his marrying

disappointed by the marriage of that prince Nicephorus; however, the latter acknowledged his new dignity of Augustus, and the two empires were amicably settled. Charles was further gratified by the great HARUN RASCHID, caliph of the Saracens, who gave him the sacred city of Jerusalem, and the pulchre. Mean time his empire was troubled with invasion by the Normans, under Godfrey, a celebrated warrior, who by their adventure and maritime skill, threatened all the west of Europe with desolation. A temporary truce was settled, and Charles made use of this to settle the final distribution of his empire. Aquitaine and Gascony, with the Spanish provinces were assigned to his son Lewis. Pepin the youngest part of Bavaria, with the whole of the Grisons. Charles the eldest had Austrasia and Thuringia. This division was confirmed by the pope; but it had scarce taken effect when the princes were obliged to defend their dominions by force of arms. Lewis and Pepin were attacked by the Saracens, and the Grisons by the Slavonians. All these enemies were defeated; but Charles was once more called to martial exertions, by Godfrey, the Norman. Charles sent a message of defiance, which was turned; but the king, by artfully dividing among the northern powers, for a while the threatened danger; these being settled, the Normans renewed their depredations, and Charles was obliged to face them in person. But Godfrey being assassinated by a private enemy, the Normans retreated, and the dominions of the emperor were freed from these invaders. The latter days of Charles were embittered by domestic misfortunes. His favourite daughter died, as did also Pepin king of Italy; and after them, his eldest son Charles. He finally associated his only surviving son Louis with the government; at Aix la-Chapelle. Charles himself survived this transaction only a few days. He died on the 27th of Jan 814; in the 46th of his age, and 47th of his reign. By his death the French monarchy was raised to its utmost splendour. He had added Aquitaine to the territories of his ancestors; he had confined the independent Britons to the shores of the ocean, and made them tributaries. He had reduced all the kingdoms of Spain from the Pyrenees to the Ebro, Roussillon, Navarre, Arragon, and Catalonia; he had seized Italy from the Alps to the borders of Sicily; but the duchy of Beneventum, or the present kingdom of Naples, excepted. He also added the whole of Germany from Pannonia; so that the French now had possession of all the country from E. to W. from the Ebro in Spain to the Vistula; and from the duchy of Beneventum to the Elbe. These achievements Charles had been obliged to purchase by horrid misdeeds; for which his only remedy was the barbarity of the people with whom he had to deal, upon whom no mild measures were likely to have had any effect. His schools showed his inclination to govern with mildness, and to advance their civilization; yet in the secret of his private conduct bordered on cruelty.

of the fate of the sons of Carloman. His
to his son Lewis, was excellent : exhorting
consider his people as his children ; to be
id in his administration, but firm in ex-
; to reward merit ; to promote his nobles
ly, and choose his ministers deliberately,
to remove them capriciously.

FRANCE, HISTORY OF, FROM CHARLES'S DEATH, TO THAT OF LEWIS I, AND UNION OF THE EMPIRE. All Charles's maxims were not sufficient to enable Lewis's dominions so extensive, and people so many as he had to deal with. At the time of his death, he was about 36 years of age, and married Ermengarde, daughter of the Count of Hesbai of the diocese of Liege, by whom he had three sons, Lothaire, Pepin, and Lewis. Lothaire, the eldest, was associated with himself in the empire, and the two youngest were entrusted with the governments of Aquitaine and Bavaria. The princes proved unfaithful to their father, and became enemies to one another. The death of Ermengarde, and the marriage of the emperor with Judith, a princess of Bavaria, artful but ambitious, proved the first source of calamity to the empire. In 823, Charles, the emperor's eldest son, was born; and his pretensions became more fatal to the public tranquillity, than the rest. Various parts of the Imperial dominions were likewise assailed by foreign enemies. Brittany and Navarre revolted; the Moors of Catalonia; while the ambition of Judith was a war amongst the brothers themselves. Lewis had been appointed sovereign of the part of Germany bounded by the Danube, the Rhine, the Neckar, and the Elbe; the part the Grisons and Burgundy, comprehending Geneva and the Swiss cantons; but this part was given to the younger sons. Lewis, and Lewis's wife, with the united forces of Aquitaine and Bavaria, the Imperial forces defeated their rebellious and proud the malecontents. The emperor was taken prisoner, and the empress retained in captivity. Lothaire, the eldest of the princes, and the rest were obliged to submit, restore the emperor in his possession, but his power was diminished with remorse. Dreading revenge, and threatened by the church, he threw up his father's seat, begged pardon, and in return relinquish what he had unjustly usurped. Lewis was re-established by the diet of Worms which had met to depose him. His object was to recall his emperor; but this aim he could not, now persecuted Lothaire to such extent that he was obliged to join his brothers and Lewis against their father. The emperor sought to check this rebellion by restoring the great of Aquitaine to Pepin, and giving the youngest son Charles, then only six years old, but pope Gregory IV. concerned himself only in Lothaire, deposing him, and sending the empress to a nunnery at Metz. The unnatural behaviour of the emperor, once more excited the enmity of his subjects. Dreux, Bp. of Metz, invited Lewis king of Bavaria to depose his father and sovereign. In this the Bavarian monarch was joined by the Duke of

the French and Saxons; so that the aged emperor was once more restored, the empress released from her nunnery, and Charles from his prison, in 833. But the ambition of Judith soon set matters once more in a flame. She persuaded the emperor to invest her son Charles with Neustria, besides the dominions formerly assigned him. This produced great discontents in Lothaire and Pepin; but their power was now too much broken to accomplish any thing by force. Pepin's death produced a new division of the empire. The claims of young Pepin and Charles his sons were disregarded, and his French dominions divided between the two brothers, Charles and Lothaire, the latter becoming guardian to his infant nephew. This enraged Lewis of Bavaria to such a degree, that he again revolted; but the unexpected appearance of the Saxons obliged him to submit. Still, however, the ambition of the empress kept matters in a ferment. The emperor died, in 841, after a most unfortunate reign of 27 years. Lewis I. was eminent for the mildness of his manners and peaceful virtues, which procured him the title of *Le Douloureux*, or the gentle: but such was the turbulence and excessive barbarity of the age in which he lived, that all his virtues, instead of procuring him respect and esteem, produced only contempt and rebellion from those, whom duty and nature should have taught submission and obedience. The emperor's death produced a civil war among his sons. The united forces of Lothaire and Pepin were defeated by those of Charles and Lewis on the plains of Fontenoy, where 100,000 Franks perished, in 842. The conquerors having retired, each into their own dominions, Lothaire found means not only to recruit his troops, but to persuade the other two princes to vigorously, that they were glad to consent to a new partition of the empire. By this partition Lothaire kept Italy, with the tract of country between the Rhine and Seine, and between the Meuse and Scheldt. Charles had Aquitaine, with the country between the Loire and the Meuse, while Lewis had Bavaria, with the rest of Germany, from whence he was named *le roi des Germains*. By this partition, Germany and France were divided so as never to be reunited. That part of France called to Lothaire, was now called *Lotharingue*, now corrupted to *Lothain*. The sovereignty, however, which he had acquired at the expense of every kind of duty, and to much blood, afforded him none but imaginary power. He died, within the year, and his empire was partitioned, as before, into three kingdoms, in 843. Louis the Younger, being still king, gave the whole of Lothain to his second son, Lothaire with the title of king; and to his eldest son Charles, named the *Bald*. Pepin, however, died young, and part of his empire, now called Charles's empire, was properly the king of France.

1857 he was elected to the office of Charles
his successor to his brother. In 1857 to
1857 his province had been afflicted by the annual
depredations of the Normans, from whom Charles
was said to procure peace at a lesser expense
than might have resulted on a longer war.
Brittany had also revolted; and then it returned
by the appearance of Charles himself, and a
D powerful

powerful army, he was no sooner embarrassed by the Normans, than they threw off the yoke, and under the conduct of their duke Lewis subdued the neighbouring country of Rennes: after which Lewis assumed the title of king, which he transmitted to his son Herispee. He subdued Charles; and his subjects, despising the imbecility of their king, put themselves under the protection of Lewis the German; who, taking the opportunity of Charles's absence repelling the Danes, marched with a formidable army into France, and was solemnly crowned by the Abp. of Sens in 857. Too confident, as it is established on the throne, he was persuaded to dismiss his German forces; when Charles marched against him with an army, and Lewis abandoned his new kingdom as easily as he had obtained it. The kingdom of Charles, however, continued in a very tottering situation. The Normans harassed him in one quarter, and the Bretons in another. He marched against the latter in 856; but was totally defeated after an engagement which had lasted two days. This was chiefly owing to a noted warrior named *Robert le Fort*, or *the Strong*, who commanded the Bretons; but Charles gained him over, by giving him the title of Duke of France, including the country between the Seine and the Loire. The abilities of Robert supported Charles for a little; but his difficulties returned on his death; he was killed in repelling the Danes. The death of the king of Lorraine in 869 made some reparation; the cities of Lyons, Vienne, Toul, Reims, Verdun, Cambrai, Viviers, and Uzès, with the territories of Hainault, Zealand, and Holland, came to his share. Cologne, Utrecht, Treves, Mentz, Strasbourg, and the rest of Lothaire's territories, were assigned to Lewis the German. Meanwhile the Normans continued their incursions, so that Solomon, king of Brittany joined with Charles, to repel the common enemy: an event which ruined their enterprise, and they were glad to relinquish all the spoil they had taken. Charles delivered from a formidable enemy, aspired to the imperial crown, vacant by the death of Lewis. It belonged of right to Lewis the German; but Charles, having quickly assembled a powerful army, marched into Italy before Lewis could be apprised; and being favourably received at Rome, the Imperial crown was put upon his head by Pope Adrian II, in 873. Lewis, discharged his fury on the defenceless country of Champagne; and though Charles obliged him to retire, yet he continued his preparations with such vigour, that Charles would probably have found him a very formidable adversary; but he died in 877. Charles no sooner heard of his brother's decease, than he invaded Franconia, Thuringia, and Lower Lorraine, which belonged to his son Lewis. He was unsuccessful; and though superior in numbers, was defeated with great slaughter; and was at some time informed that the Normans had invaded his own territories, and taken possession of Rouen. These disasters affected him so that he fell dangerously ill, from which he was scarce recovered, when he was called into Italy to assist the Pope against the *Saracens*, aided by the duke of Pavia and the *Greek* emperor. Charles passed into Italy with *but a few followers*; but when he came to Pavia,

where the Pope had appointed to meet was informed that Carloman king of Bavaria son of Lewis the German, had entered Italy with a powerful army, and claimed the empire in his father's right. Charles prepared to meet him; but his generals conspired against him; the soldiers refused to pass the Alps. Charles was obliged to retire to France, while Carloman, dreading him, prepared to return to Italy. This was the last of Charles's enterprising journey brought on a return of his disease which was rendered fatal through the treachery of a Jewish physician named Zedechias, who administered poison to him. He expired in a cottage upon mount Cenis, in the 54th year of his age, and 38th of his reign.

(19.) FRANCE, HISTORY OF, FROM CHARLES II'S DEATH, TO THE DEPOSITION OF CHARLES III. The ambition of Charles had occasioned much distress both to himself and his subjects. His son Lewis II, surnamed, *the Stammerer*, of a quite different disposition; but his administration was ill calculated to retrieve the state. He died on the 10th of April 879, and left a queen Adelaide pregnant; who soon after delivered of a son, named Charles. A civil war followed an interregnum; during which a faction was formed in favour of the princes, sons to Lewis the brother of Charles II. It proved abortive; and the two sons of Charles, Lewis III. and Carloman, were proclaimed kings of France. Another kingdom was at the same time erected by an assembly of the states, in the south of France, called *Provence*, which consisted of the counties of *Lyonnais, Savoy, Dauphiny, Franche-Comte*, and part of Burgundy; and this kingdom was given to Duke Boson, brother-in-law to Charles II. In 881, they both died; Lewis, by a wound, and Carloman of a wound. This produced a second interregnum; which ended with the deposition of Charles III, surnamed *the Good*, emperor of Germany. His reign was very unfortunate, from the Normans whom he had allowed to settle in the north of France, and laid siege to Paris. Charles, who was forced to oppose them, prevailed on them to depart by a large sum of money. But as he could not advance the money at once, they remained in the country all the winter; and in return, plundered the country, amassing vast wealth besides what Charles had promised. Charles fled to Germany, in a very declining state of health. Here he quarrelled with his empress; and abandoned by all his friends, he was reduced to such distress, that he would have had bread to eat, had not he been supplied by the Abp. of Mentz, out of charity.

(20.) FRANCE, HISTORY OF, FROM THE DEPOSITION OF CHARLES III, TO THE EXCLUSION OF THE CARLOVINGIAN RACE. Eudes count of Burgundy, chosen king by the nobility during the minority of Charles IV. surnamed *the Simple*, the son of Charles II, by Adelaide. He defeated the Normans, repressed the power of the nobility; and formed a faction in favour of Charles IV. He was sent for, with his mother, from Burgundy, and received with uncommon moderation, though he conducted with great bravery, peaceably re-

great part of the kingdom to him, and consented to do homage for the rest. He died soon after this agreement, in 898. During the reign of Charles IV, the French Government declined. By introducing fiefs, those noblemen who had got possession of governments, confirmed to them and their heirs for ever, became in a manner independent sovereigns: and as they had others under them, and they again others under them, and even these had their vassals a vast number of insupportable little tyrannies were thus erected. The Normans, too, ravaged the country in the most unchristian manner. At last Charles ceded to Rollo, the captain of these barbarians, the duchy of Normandy; who thereupon became Christian, changed his name to Robert, and that of the duchy to Normandy. During the remainder of the reign of Charles the Simple, the usurpations of Robert, grandfather of Hugh Capet, and of Rodolph D. of Burgundy, and the whole reigns of Lewis IV. surnamed the Stranger, Lothaire, and Lewis V. the pious of the Carolingian race continually deduced; till at last they were supplanted by Hugh Capet, who had been created duke of France by Lothaire. This revolution happened in 987, and was brought about much in the same manner as the former one had been by Pepin.

(21.) FRANCE, HISTORY OF, FROM HUGH CAPET'S ASSUMPTION OF THE CROWN, TO HENRY I'S DEATH. Hugh Capet did not assume the crown till the death of Lewis V, when he was preferred by the voice of the nation, to his rival Charles D. of Lorraine. He proved an active and prudent monarch, and very fit to keep his subjects in awe. He died on the 24th Oct. 996, leaving his dominions in perfect quiet to his son Robert. The new king inherited the good qualities of his father. In his reign the kingdom was enlarged by the death of Henry duke of Burgundy, the king's uncle, whom he succeeded. This new territory, however, occasioned a war of several years continuance, against some pretenders to that duchy; and had it not been for the assistance of the D. of Normandy, it is doubtful whether the king would have succeeded.—As Robert preferred peace and tranquillity to extended dominions with a precarious tenure, he refused Italy and the imperial crown, both which were offered him. He died on the 20th July, 1031, having reigned 34 years, and lived 60. He was succeeded by his son Henry I. who met with great opposition from his mother. She had always hated him; and preferred his younger brother Robert, in whose favour she now raised an insurrection. By the assistance of Robert duke of Normandy, however, Henry overcame all his enemies, and established himself on the throne. In return he supported William, Robert's natural son, afterwards king of England, in the duchy of Normandy: but afterwards, he not only supported the pretenders to the duchy of Normandy secretly, but invaded that country himself. Proving unsuccessful, he was obliged to make peace: but no sincere reconciliation ever followed; the treaty, therefore, was quickly broken; and Henry once more invaded Normandy with two armies. The first was harassed by continual skirmishes, and the last

to agree to the duke's terms; but the rancour between them never ceased, and was the cause of that enmity, which for many years produced perpetual quarrels between France and the Norman kings in England. Henry died in 1066, as was suspected, by poison.

(22.) FRANCE, HISTORY OF, FROM HENRY I'S DEATH, TO THAT OF PHILIP I. Henry was succeeded by his eldest son Philip, only 7 years of age. Baldwin earl of Flanders, his guardian, died in 1066, about the time that William of Normandy conquered England. After his death, Philip began to show a very sincere, haughty, and oppressive disposition. He engaged in a war with William the Conqueror, and supported his son Robert in his rebellion against him: (see ENGLAND, § 19.) and after William's death he assisted Robert's brothers against him; by which he was forced to consent to a partition of his dominions. In 1092, Philip procured a divorce from Bertha, and proposed marriage to Emma, daughter to Roger count of Calabria. The treaty was concluded; and the princess sent over, with much treasure in jewels, and ready money: but the king retained her fortune, dismissed the princess, and carried off the princess of Anjou, one of the handsomest women in France, from her husband. He procured a divorce between her and her husband, and a Norman bishop solemnized his own marriage with her. These transactions were so scandalous, that pope Urban II, in a council held at Autun, in 1094, excommunicated Philip, in case he would not part with the countess. He professed repentance and was absolved, a 2d and a 3d time, always returning to the countess when the censure was taken off; by which conduct he became despicable; although too many of the nobility followed his example, but at the same time despised his authority; not only making war upon each other, but robbing his subjects with impunity. In 1113, Philip prevailed on the court of Rome to have his affair revised in an assembly at Paderborn; where, in spite of his utmost efforts, sentence of excommunication was a 4th time pronounced against him. Notwithstanding all these sentences, as Q. Bertha was dead, and the count of Anjou, bribed by a large sum of money, assisted in procuring a dispensation, the countess was proclaimed queen of France. But though these domestic affairs were now quieted, his negligence had thrown the affairs of the nation into great disorder. He therefore associated in the government his eldest son Lewis. This prince was the very reverse of his father; and by his activity and resolution, he reduced the rebellious nobility to submission, and saved the state from being utterly subverted. For these services the queen became so jealous of his popularity, that he found it necessary to retire to England; where he was graciously received by Henry I. He had not been long at court, before Henry received a letter from Philip, requesting him, closely to confine his son, or even *dispute him!* Henry, however, instead of complying with this infamous request, showed the letter to Lewis, and sent him home with all imaginable marks of respect. On his return, he demanded justice; but the queen caused poison to be given him. A stranger, however, saved his life; but a palace

remained in his face ever afterwards, though he grew so fat that he was surnamed *the Gross*. He determined to revenge his quarrel by force; but his father having caused the queen to make the most humble submissions to him, he was appeased. Philip died in 1108, and was succeeded by his son Lewis VI.

(23.) FRANCE, HISTORY OF, FROM LEWIS VI'S ACCESSION, TO THE DEATH OF LEWIS VII. The first years of Lewis's reign were disturbed by insurrections of his lords, which were secretly fomented by Henry I. of England, that, by weakening France, Normandy might be the more secure. This quickly brought on a war; in which Henry was defeated, and his son William obliged to do homage to Lewis for Normandy. But Lewis not long after espoused the cause of William the son of Robert duke of Normandy, whom Henry had unjustly deprived of that duchy. This brought on a new war, in which Lewis, being defeated, was obliged to make a short-lived peace upon any terms. Lewis soon renewed his intrigues in favour of William, and formed a confederacy against Henry; which the latter not only dissipated, but prevailed upon the emperor Henry V. to invade France with all his forces on one side, while he was to attack it on the other. But Lewis having collected an army of 200,000 men, both thought proper to desist. He would have marched into Normandy, but his great vassals refused; saying that they had assembled to defend France from a foreign prince, not to enlarge his power. This was followed by a peace with Henry; which, as both monarchs had now seen the extent of each other's power, was made on pretty equal terms, and kept during the life of Lewis, who died in 1137, and was succeeded by his son Lewis VII. The young king was not endowed with any of those qualities which constitute a great monarch. In compliance with the superstition of the age, he undertook an expedition to the Holy Land, from whence he returned without glory. His queen Eleanor accompanied him; but he was so much offended with her gallantries there, as well as afterwards, that he divorced her, and returned the duchy of Guienne, her portion. Six weeks after this she married Henry duke of Normandy, count of Anjou and Maine, and heir apparent to the crown of England. This marriage was a very great mortification to Lewis; and procured him the surname of *the Young*, on account of his folly. When Henry II. ascended the throne of England, some wars were carried on between him and Lewis, with little advantage on either side. At last, however, a reconciliation took place; and Lewis took a voyage to England, to visit the shrine of St Thomas of Canterbury. On his return he was struck with an apoplexy; which, though he partially recovered, rendered his right side paralytic: and having languished for about a year, he died on the 10th Sept. 1180, leaving the kingdom to his son Philip II.

(24.) FRANCE, HISTORY OF, FROM LEWIS VII'S DEATH, TO THAT OF PHILIP II. Philip II. surnamed *The Gift of God*, *The Magnanimous*, and *The Strong*, during his life, and *Augustus* after his death, is reckoned one of the greatest princes that ever sat on the throne of France. It is not

clear that these titles were well founded. Early in his reign he was opposed by a strong faction excited by his mother. Then he repressed with a vigour which did him honour; but his taking part with the children of Henry II. of England, their unnatural contests, and his treacherous combination with John to seize his brother's kingdom when he was detained in prison by the emperor of Germany, are indelible stains on his character, and for ever exclude him from the title of *Magnanimous*. As to military skill and personal valour, he was evidently inferior to Richard I. of England; and can his recovering of the provinces held by the English in France, from such a dastardly prince as John, intitle him to the epithet of *Conqueror*. In politics he was evidently the dupe of the pope. An account of these transactions, which are the principal ones of this reign, is given under ENGLAND, § 23—26. Philip II. died in 1223.

(25.) FRANCE, HISTORY OF, FROM LEWIS VII'S ACCESSION TO THE DEATH OF ST LEWIS. Lewis VIII. succeeded his father Philip II. in 1223; and had been crowned king of England, while Dauphin, in 1216. See ENGLAND, § 25, 26. His reign in France was short, being only 3 years. He besieged Avignon with 50,000 men; lost his brave troops; and dying in 1226, was succeeded by Lewis IX., afterwards styled *St Lewis*. This prince possessed many good qualities, but was deeply tainted with superstition. This induced him to engage in two crusades. The first was against the Saracens in Egypt, in which he was taken prisoner and cruelly treated; but ransomed by paying a million of pieces of gold, and surrendering Damietta. He no sooner regained his liberty, than entered on a new expedition into Syria; but from this he was soon obliged to return, by the death of his mother, whom he had appointed regent and who had managed the national affairs with great prudence. He found many disorders on his return, which he set himself to reform. Having succeeded in this, he yielded to Henry III. of England, the Limousin, Querci, Perigord, and some other places; in consideration of Henry and his son prince Edward renouncing all pretensions to Normandy, and the other provinces of France which the English had formerly possessed. The reputation of Lewis for justice was so great, that the barons of England and king Henry III. made him umpire in their differences. But though very just, his decision had no good effect. At last, having settled every thing in his kingdom, he set out on another crusade for Africa; where he died of the plague, on the 25th Aug. 1270.

(26.) FRANCE, HISTORY OF, FROM LEWIS IX'S DEATH, TO THAT OF PHILIP III. Philip III. surnamed *The Fair*, notwithstanding his father's misfortunes, continued the war against the Infidels with great vigour; and by the assistance of his uncle Charles king of Sicily, he brought it to a fortunate conclusion. The Saracens were defeated in two engagements, and the king of Tunis was obliged to sue for peace: offering to double the tribute he formerly paid the crown of Sicily; reimburse the expenses of the war; and to permit Christianity to be freely propagated throughout his dominions. The two princes then set sail for Europe; but the seeds of the distemper which had

infected

infected the army in Africa, not being eradicated, broke forth on their arrival in Sicily, and raged with great violence. The king's brother John, his queen Isabella, with the king and queen of Navarre, the count and countess of Poitiers, and many others, perished by this dreadful malady. On his return, Philip took possession of Provence and Thoulousé; married his 2d son, then very young, to the only daughter of the king of Navarre; while he himself espoused Mary, daughter of the duke of Brabant. He cultivated the friendship of Edward I. of England, and entered into a war with Spain. But his attention was quickly called off by the death of his eldest son Lewis, in 1275, at the age of 12. The young queen, Mary, was accused by one La Brosse, of having poisoned him. Philip gave some credit to this accusation; but, applying to an inspired nun, her answer proved fatal to La Brosse. Mary, cleared by this pretended prophetic, La Brosse was accused of treason, and condemned. The manner of his trial and execution, however, were such, that the tide of popular favour was turned; La Brosse was thought innocent, and the king and queen strongly suspected. At this time the Sicilians, over whom Charles of Anjou ruled, instigated by John of Procida, a noble exile, resolved to break the French yoke by a general massacre. This was accordingly put in execution; and the French, to the number of 8000, murdered in one night. Charles, sensibly affected by this, laid siege to Messina, and sailed directly to Marseilles, where he obtained a powerful reinforcement. In his absence his son, to whom he had entrusted the siege, having nobly engaged with the Spanish fleet, was defeated and taken prisoner. His father died of grief, and Sicily was attached to the house of Arragon. The misfortunes of Charles were followed by others equally great to Philip himself. Pope Martin IV. in his zeal for the duke of Anjou, had excommunicated Peter king of Arragon, and bestowed his kingdom on Charles of Valois, a younger son of the king of France. In defending himself against this unjust sentence, Peter was mortally wounded; but the defeat of the French fleet soon affected Philip, that he fell sick. His disease, aided by the heat of the climate, fatigue, grief and infirmities, proved fatal. He died at Perpignan in the 41st year of his age, and 16th of August.

30. FRANCE, HISTORY OF, FROM PHILIP IV's ACCESSION TO HIS DEATH. By the death of Philip the Hardy the French crown devolved on his 2d son, called also Philip, from the beauty of his person surnamed *the Fair*; who had espoused the princess of Navarre, and was then in his 17th year. By marrying this princess he had obtained the counties of Champagne and Brie; yet with all this additional power he was unable to support the war in which his predecessor had engaged. For this reason he abandoned the interest of the Infants de la Cerda, and settled the differences with Castile. This was effected by Edward I. of England; by whose mediation also Charles the Little, son to the duke of Anjou, was released from his captivity; Edward himself paying part of his ransom. On this Charles renounced his claim to Sicily; and Philip promised that his

kinsman, Philip of Valois, should renounce all pretensions to the crown of Arragon. In return the latter obtained the eldest daughter of Charles with Arjou and Maine as a dowry. This tranquillity, however, was soon interrupted by differences with Edward the promoter of it, pope Boniface VIII. and Guy de Dampier, count of Flanders. That with England was accidental. A Norman and an English vessel having met off the coast of Bayonne, and both needing water, the crews quarrelled. A Norman was killed by his own weapon, with which he assailed an Englishman; the Normans complained to Philip; who, instantly allowed them to redress their supposed injuries. On this a piratical war commenced, in which the sovereigns for some time took no active part, though other nations interfered; the Irish and Dutch seamen siding with the English, and those of Flanders and Genoa with the French. At last the affair became so serious, that in one engagement 15,000 French perished. Philip, alarmed, summoned the king of England as his vassal to attend; and, on his refusal, declared his estates France forfeited. After many negotiations, Philip declared he would be satisfied with the possession of Guienne, which he conveyed instantly to the king of England, as soon as it should be put into his hands. Edward complied, but no sooner had Philip obtained possession, than he persisted in the forfeiture; this treachery instantly produced a war. Edward concluded a treaty with the emperor Adolphus, together with the counts of Brittany, Holland, Bar, Juliers, Gueldres, and Flanders; while Philip leagued with John Balliol of Scotland. During this war the French made descent on the coast of England, and destroyed Dover; while Edward, in revenge, landed in Gascony with an army of 50,000 men. But being pretty equally matched, a suspension of arms for two years was agreed to; during which a peace was finally concluded, by pope Boniface VIII. Guienne was restored; Edward espoused Margaret the sister of Philip; while his daughter Isabel was given to the prince of Wales. Philip and Edward behaved to their allies with equal perfidy. Balliol was abandoned to the resentment of Edward; while Guy, earl of Flanders, was left exposed to the resentment of Philip. This reconciliation was soon followed by a difference with pope Boniface, the mediator between them. The pope had inserted in their reference, that he was chosen as a private man, and not as Pope. The haughty pontiff soon showed that he was not to be treated so, and a contest with Philip quickly ensued. Boniface forbid the clergy to grant the king any favours without the consent of the Holy See. Philip in revenge prohibited them from sending monies out of the kingdom without his leave; and in protecting the Colonnas, the implacable enemies of Boniface. This so irritated his holiness that he summoned the clergy of France to Rome; while Philip retaliated, by seizing the temporalities of those who obeyed the summons, and recalling his brother Charles of Valois, the *pope's general*. He also dispatched two cardinals, to levy such a body of troops as might execute his hostile purposes. With these he suddenly invested the pope in Avignon; and while the bull was preparing for execution

excommunication of Philip, the Pope himself was taken prisoner by Philip's troops. Though Boniface had been delivered up by the treachery of the people of Anagnina, yet he was no sooner a prisoner and in distress, than they rescued him and conveyed him to Rome, where he soon after died. His successor Benedict X. revoked the excommunication, and attempted to regain Philip by gentle means: but, before this could be effected, he died, not without suspicion of poison. After his decease Philip offered to procure the papal chair for Bertrand archbishop of Bourdeaux, if he would condemn the memory of Boniface, restore the Colonna which had been forfeited, allow him, for five years, the tenths of the clergy of France, and comply with a request which at that time it was not proper to divulge. Bertrand, on these terms, ascended the papal throne by the name of *Clement V*, but was nearly killed returning from the cathedral of Lyons, by the falling of a wall; by which accident the duke of Brittany was killed, and the king and count of Valois considerably bruised. The new pope resided at Avignon, where he complied with all the conditions, except as to the conduct of Boniface, which he refused. That which Philip had at first concealed, was discovered by the death of the emperor Albert of Austria; after which event he desired Clement to assist him in placing his brother Charles of Valois on the Imperial throne. But his holiness, apprehensive of danger, urged the diet instantly to elect Henry of Luxemburg. The election was over before Philip arrived at Avignon; and the only consolation he could obtain was the possession of Lyons, which had hitherto maintained an independency under its own archbishop. Mean time Guy, E. of Flanders, abandoned by Edward of England, was obliged to throw himself on the mercy of the French monarch, who had sent his brother, Charles of Valois, with a powerful army to invade his dominions. From the latter indeed he had obtained a promise, that if he could not, within a year, compose the differences between him and Philip, he should be at liberty to retire, and pursue what measures he pleased. But Philip detained him, with two of his sons, in close confinement, while he himself entering Flanders was every where received as sovereign; and at his departure appointed John de Chatillon, a relation of the queen to govern those territories. The new governor repaired the fortifications, but being of a very tyrannical disposition, and the times not allowing his master to keep regular garrisons, an insurrection took place. This would have been effectually quelled by the magistrates, had not Chatillon unluckily entered Bruges, and publickly displayed two hogheads of ropes, which he threatened to employ in the execution of the inhabitants. On this they flew to arms, and massacred 1500 French; Chatillon escaped by swimming over the town ditch. The insurgents, soon amounting to an army of 60,000 men, besieged Courtray. Here they were rashly attacked by count Artois, who was cut off with 20,000 of his troops. Philip determined on revenge; tho' at the expence of debasing the coin of the kingdom. But this enabled him to enter Flanders with such force as would probably have subdued the whole country, had not Edward artfully

communicated to the queen of France, as a secret, a feigned correspondence between the French nobility and the court of Rome; by which false intelligence Philip was induced to abandon the enterprise. The war continued, but Philip was constantly defeated by the Flemings; and the only compensation Philip obtained was Courtray. The next remarkable transaction was the expulsion of the Templars, who enjoyed immense possessions in France. Their estates were confiscated and upwards of 50 of them were put to death. The grand master with three of his principal officers, were killed by a slow fire. All these unfortunate knights had been accused of the most gross sensualities. Particulars were said to be revealed, by two criminals who were pardoned for the discovery they made; which were confirmed by their confession. But this confession was afterwards retracted, as being extorted; and those who survived maintained their purity to the last: On the whole, it was believed that Philip consulted avarice in this cruel execution. His latter years were embittered by domestic misfortunes. His daughters-in-law, Margaret daughter of the king of Hungary and Jean and Blanch of the count of Burgundy, the wives of Lewis, Philip, and Charles, were charged with infidelity. After a severe trial Margaret and Blanch were condemned to perpetual imprisonment; and Margaret was afterwards strangled by order of her husband Lewis. Two other paramours, Philip and Walter de Launay, two others, were slayed alive, and hung on a gibbet with an usher, their confidant. The uneasiness which Philip suffered on this account is supposed to have hastened his death, in 1314, in the 46th year of his age, and 30th of his reign.

(28.) FRANCE, HISTORY OF, FROM PHILIP IV'S DEATH, TO THAT OF PHILIP V, AND THE ACCESSION OF CHARLES IV. Lewis X, surnamed *Hutin*, or the *Boisterous*, on account of his violent temper, found his treasury so exhausted that he was obliged to delay the ceremony of coronation with his queen Clemente, daughter of the king of Hungary. Finding the kingdom very distracted, he applied himself to appease his subjects, and conciliate their affection. In this he was assisted by his uncle Charles of Valois, whom he at length devolved the government of the kingdom. This regent, however, acted with such cruelty as is said to have proved fatal to himself; for having put to death a nobleman named *Enguerrand de Poitiers de Marigni*, who enjoyed the late king's confidence, this was so resented, that his friends were thought to have administered poison to the king; who expired suddenly after drinking a glass of cold water, in the 26th year of his age, and 2d of his reign. On his death, Charles prepared to dispute the regnity with his brothers. Philip count of Flanders, the eldest brother, was then at Rome assisting in the election of a new pope; but on his return the throne was assigned to him by the unanimous voice of the people. His prospects were closed by the queen-dowager Clemente being delivered of a son, who was introduced among the king's children in France, under the name of *John I*. His death, which lasted 3 weeks, or as Marcel says, in 8 days, sealed the throne to Philip V, who, on account

was surnamed the *Long*. His conduct superior to that of his predecessor, as he the Flemings, and compelled their consent to a peace. He summoned Edward of England to do homage for his lands in France; but that monarch was in difficulties, which rendered the visitant, and sent excuses to Philip, which he sent an army into Italy to quiet the factions of the Guelphs and Gibelins, so long filled that country with blood and war; but the event proved unfortunate, a contagious distemper swept off many thousands of the French. Superstition imputed this to the king conspiring with the Saracens to poison the French. A persecution instantly commenced against them, and great numbers of them were killed; while the populace insulted their persons and plundered their houses without remorse. The remainder of Philip's reign was spent in regaining internal concerns of the kingdom. He died of a fever and dysentery in 1322, the 28th of April and 6th of his reign, and was succeeded by his son Charles IV. surnamed the *Fair*.

FRANCE, HISTORY OF, FROM PHILIP THE FIFTH, TO THAT OF PHILIP VI. Charles entering some disputes with the duke of Burgundy, dissolved his marriage with Blanch, and married in prison, and espoused Mary daughter of Henry VIII. emperor of Germany. His marriage had in view the imperial crown, which had been so long separated from France; and in 1325 the imperial crown was disputed between Lewis of Bavaria and the king of Austria; the latter of whom had been prisoner in a battle with Lewis. But Lewis, who entertained an implacable hatred to the emperor, excommunicated him. The king of France embarked in the same cause, with an army of Bavaria; while Frederick continued to maintain his claim to the empire which he successfully maintained. Lewis, however, releasing his prisoner, and dismissing him, alarmed his most formidable antagonist. The pope and Leopold preserved their neutrality, while it was determined that a new election should be held, to transfer the crown to Charles. In pursuit of this view, the king of France set out for Germany with a splendid army; but soon found that his only possibility of accomplishing his wish was to remain alone remained his friend: and even his son-in-law the king of Bohemia absented himself from the diet; while the death of the emperor put an end to all connections with that prince. On the decease of Mary, Charles espoused his daughter to the count of Evreux; and to prevent the danger of an infant succession, he contracted an alliance with Robert king of Scotland; but it was provided, that should either die without heir apparent, the states of the kingdom should fill the vacant throne, and the surviving monarch should with his whole power support the nomination. Charles died in the 34th year of his age, leaving his reign pregnant; and as the succession depended on event, a regent was necessary. Two candidates instantly appeared, urging at the same

time their right to the crown as well as the regency. These were, Philip of Valois, cousin-german to the deceased king; and Edward III. king of England the nephew of Charles, who aspired to the throne in right of his mother. His pretensions were easily set aside, and Philip was confirmed regent: from which he soon after stepped into the throne, the queen being delivered of a daughter; from which he acquired the surname of the *Fortunate*. He summoned the English monarch to do homage for his possessions in France; and upon his not answering his summons, forfeited them, and seized his revenues. This induced Edward to cross the sea and pay homage; which Philip consented to receive, upon condition of a proper explanation being given; but as this was studiously delayed, after the return of the king of England, Guienne was again seized by the French monarch. Edward unwilling to lose his continental dominions, or involve himself in a war for the sake of a mere ceremony sent over a formal deed, acknowledging that he owed liege homage to France. Thus the flame was smothered for the time, and would perhaps have been entirely extinguished, but for the intrigues of Robert of Artois, brother-in-law to Philip VI. who had been expelled his country, and had taken refuge in England. By him he was persuaded to renew his pretensions to the crown of France, which of necessity produced a war. For some time, neither party made any open declaration of hostility; but each knew the other's designs. Philip, under pretence of taking the cross, made prodigious armaments, and formed alliances on every side; while Edward, resolving to renew his claim to the crown of France, projected the conquest of Scotland. In this, he failed; and, Philip, to favour the Scots, with whom he was in alliance, suffered his subjects to make irruptions into Guienne. In 1337, the war broke out. Philip, having detached part of his fleet against the Infidels, employed the rest, chiefly Genoese vessels, against the English. The Flemings were courted by both. Lewis count of Flanders declared for Philip, but his subjects were more inclined to Edward. James Arteville a brewer, a subtle and artful man, governed them as if he had been their prince; and the English commenced determining him in favour of Edward, that prince, at his request, embarked for Sluys with a numerous army. He arrived in 1338; and on his first landing, it was resolved that the German princes in alliance with him should attack France. But the Flemings, who were vassals of France, pretended scruples at invading their sovereign's territory. To quiet these, Edward assumed the title of *King of France*; and by virtue of this right claimed their assistance to dethrone Philip of Valois as an usurper. This step, which he feared would breed pet jealousies, he did not take without consulting, and, from that time we may date that national animosity which the English have so long born to the French. Edward's first attempt was upon the city of Cambrai; but he was soon repulsed upon by Robert of Artois to make the English march into Flanders. This country he entered with an army of near 50,000 men, mostly English. Philip appeared with an army of 40,000 men, chiefly natives, and a brave and experienced

pected. But Edward was averse to engage against so great a superiority; and Philip thought it sufficient if he eluded the attacks of his enemy. The two armies faced each other for several days; mutual challenges were sent; and Edward at last retired into Flanders, and dispersed his army. Such was the fruitless conclusion of Edward's first expedition, which plunged him into difficulties. He had contracted near 300,000*l.* of debt; anticipated all his revenue; pawned every thing of value either of his own or his queen's; nay, he was obliged in some measure even to pawn himself to his creditors, by desiring their permission to go over to England to procure supply, and by promising to return in person if he did not remit their money. On his arrival in England, however, he procured a large supply, sufficient to make all the necessary preparations for a new invasion; and so certain were the English that France would now be conquered, that the parliament, before Edward's departure, protested that they owed him no obedience as king of France, but that the two kingdoms must remain for ever distinct and independent. Edward set out on his 2d expedition with a fleet of 240 vessels. Philip had prepared a fleet of 400 vessels, manned with 40,000 men; which he stationed off Sluys, to intercept him. The two fleets met on the 13th of June 1340; the English, with the wind of the enemy, and the sun on their backs, began the action. It was fierce and bloody: The English archers, whose address was now much celebrated, galled the French; and when the ships grappled, the example of the king and nobility with him so animated the seamen and soldiers, that they everywhere maintained the superiority. The Flemings, observing the battle from the shore, sent a reinforcement to the English; which, coming unexpectedly, had a greater effect than in proportion to its power and numbers; 230 ships were taken, and 30,000 Frenchmen killed, with two admirals: the loss of the English was inconsiderable, compared to the importance of the victory. None of Philip's courtiers dared to inform him of the event; till his jester gave him a hint, by which he discovered the loss he had sustained. After this great victory, Edward landed, and laid siege to Tournay. Philip marched to its relief; and acted with so much caution, that Edward found himself in a manner blocked up in his camp: and the countess dowager of Hainault, sister to Philip, mother-in-law to Edward, and sister-in-law to Robert of Artois, coming out of a convent, interposed with so much spirit and address, that she effected a truce for one year, and might perhaps have brought about a peace had she survived. In 1341, however, Edward's ambition was once more excited by the count de Montfort, who had possessed himself of Brittany, and applied to Edward to recover his crown. This request entirely coincided with Edward's desires. Montfort was an active and valiant prince, and drawn to him by interest, and he had had a entrance into the heart of France. The following prospects, however, were dashed by the government of Montfort; which soon being discovered, *he was besieged in Nantz and taken. But June of Flanders, his wife, soon made up for the*

loss of her husband; assembled the inhabitants of Rennes, where she then resided; and carrying her infant son in her arms, deplored her misfortune and inspired the citizens with zeal for her country. The inhabitants of Nantz instantly espoused her interests, and all the other fortresses of Brittany followed their example. Edward was intreated to send succours with all possible expedition. The countess of Hainault, where she resolved to sustain the attacks of the enemy. Charles de Blois, Philip's general, anxious to make himself master of this important fortress, and still more to take the countess a prisoner, sat down before the place with a large army, and conducted the siege with indefatigable industry. The defence was less vigorous: several sallies were made by the garrison, in which the countess herself led on the assault. Observing one day that all the garrison had quitted the camp to join in a general assault, she sallied out at the head of 306 horse, set fire to the enemies tents, put their sutlers to the sword, and occasioned such an alarm, that the French desisted from the assault, to cut off her communication with the town. Thus intercepted, she retired to Auray, where she continued 5 or 6 days, then returning at the head of 500 horse, she forced her way through the French camp, and joined her faithful citizens in triumph. But the besiegers had at length made several breaches in the walls; and it was thought that a general assault would be fatal. A capitulation was proposed, and a conference begun, when the countess, looking towards the sea, descried some ships at anchor. She immediately exclaimed that succours were arrived, and forbade any further capitulation. She was not disappointed; the fleet carried a body of English gentlemen, with 6000 archers, whom Edward had sent, and who had been detained by contrary winds. They were led to the harbour by Sir Walter Mauny, one of the most valiant commanders of his time. This reinforced the declining spirits of the Bretons until the late truce was expired; when they were followed by a more considerable reinforcement under Robert of Artois, who made himself master of Vannes: but the Bretons soon recovered the city, and Robert was mortally wounded. Edward, eager to revenge his death, soon landed at Morbihan with an army of 12,000 men. While these he undertook at once the siege of Vannes, Nantz, and Rennes; but by dividing his forces he failed in all, and gave an opportunity to John, duke of Normandy, the king of France's eldest son, to invest him in his camp. His provisions soon failed, and Edward with all his valour might have surrendered, had he not, by artful negotiations, induced Philip to consent to a truce of years. This was effected by the court of Rome, and the French monarch soon saw the partition of that court, and the imprudence of the step he had taken. Edward found a pretence to retire from the execution of some noble projects in Brittany, who, he said, were partisans of Montfort, and chose to look upon this as an infraction of the treaty. Philip secured himself against the power of his rival by alliances, and by purchasing Montpellier from the king of Majorca: but in the mean time, the English, commanded by the

by, had invaded Guienne, twice defeated French army under Count de Lisle, and made slaves masters of many towns. Philip, by exhausted state of his treasury, could not any opposition. To recruit his finances, a duty on salt; which nearly excited a rebellion. When these discontents were assuaged, led an army of 100,000 men, whose courage raised by the presence of the dukes of Normandy and Burgundy. The English general was not compelled to stand upon the defensive. Forts yielded after another, till at length appeared but a total extinction of the power of England upon the continent. In this year, Edward embarked, in 1346, at Southampton, on board a fleet of near 1000 sail. He led with him the chief nobility of England, his eldest son the prince of Wales (the *Black Prince*), a youth of about 15 years old, and alreadymarkable both for understanding and valour. His army consisted of 4500 men at arms, 10,000 archers, 10,000 Welsh infantry, and 6000 Irish; which he landed safely at La Hogue, a port in Normandy, which country he determined to make the seat of the war. The intelligence of Edward's landing, and the devastations made by his troops, excited universal consternation. The rich city of Caen was taken and plundered; the villages and towns, up to Paris, shared the same fate; the French could only break down their great guns to stop the invader's career. In the mean time Philip had stationed his general, Godemar Fréchal, with an army on the opposite side of the river, over which Edward must pass; while he kept at the head of 120,000 fighting men, advanced to give battle. Edward, thus exposed to danger of being inclosed in an enemy's compass, promised a reward to any that should inform him of a passage over the Somme. This was discovered by a peasant, named *Cobinzigace*; and Edward had just got his whole army over the river when Philip appeared, in his rear. A battle, in which the French were overthrown with great slaughter. See *CRESSY*. Edward advanced to Caen, which was then defended by de Vienne, an experienced commander, and was with every thing necessary for defence. It was at length taken, after a year's siege. See *CH. N° 11*. From the beginning of this unhappy war, Philip had invariably showed himself desirous of peace, and the victory of Cressy did not make him more so. Edward also, notwithstanding his successes, was unable to support any longer. The mediation of Rome was readily accepted, and a truce for 3 years concluded. At the same time, Philip met with recompense for the losses he had suffered by the acquisition of Dauphiny. See *CH. N° 12*. Soon after this, Philip was married to the daughter of Philip count of Evreux, and queen of Navarre; and his son became count of Boulogne. But this domestic tranquillity was soon interrupted by the death of Edward, who expired in 1350, the 37th year of his age, and 2d of his reign.

FRANCE, HISTORY OF, FROM PHILIP VI'S REIGN, TO THE DEFEAT AND CAPTURE OF THE BLACK PRINCE. On his death, his

eldest son John succeeded; but he very soon disgusted his nobility by an unseasonable act of severity. Robert de Brienne, count of Eu and Guisnes, had been taken prisoner at Caen; and under pretence of negotiating his ransom, had passed several times between France and England; but being accused of a treasonable correspondence with Edward, he was suddenly arrested, and beheaded, without any trial. At his death it is said, that he confessed his treason; but this has not been authenticated. Having been constable of France, the badge of his office was delivered to Charles de la Carda: but he was equally unfortunate, being soon after assassinated by Charles king of Navarre, surnamed *The Wicked*. This prince, celebrated for his personal qualifications, but detested for his crimes, was John's son-in-law. He had demanded the duchy of Angouleme of the king; but as the latter bestowed it upon Carda, he had taken this method of revenging himself. John did not fail to show a proper repentment; but such was the weakness of his government, that the king of Navarre let him at defiance, and would not even ask pardon, until John had sent him his 2d son as an hostage for his personal security. But the king of Navarre even aspired to the crown of France itself; pretending a right from his mother, being grandson by the female side of Louis X. But his more immediate demands were Champagne and Brie. John however bestowed Normandy on his eldest son Charles; and commanded him to seize the estates of the king of Navarre. On this the latter soon appeared at Paris; and John was obliged to appease his murmurs at the expence of 100,000 crowns. All this time the truce with England had been ill observed on both sides; the French had seized the port of St Jean d'Angeli; and the English the town of Guisnes. The rival houses of Montfort and Blois still continued their animosities; while Edward still threatened war. The king of Navarre continued his intrigues; and even the dauphin was drawn into a confederacy against his father. John, however, being informed, found means to defeat them effectually. The dauphin was reclaimed, by shewing him the disadvantages which must accrue to himself from the connections he had formed. The king of Navarre was invited, with his principal adherents, to an entertainment, where they were arrested; the former sent prisoner to Chateau Gaillard, and several of the most obnoxious of the latter put to death. The rest of the conspirators, not dismayed by this check, immediately appeared in open rebellion; and unable, without assistance to gain their point, they invited over Edward from England. That enterprising monarch had never lost sight of his original object; and on the expiration of the truce had sent his son, Edward the *Black Prince*, with a fleet towards the coast of France. With this fleet the prince had entered the Gironde, burnt the towns and villages of Languedoc, and retired with the plunder into the country of Guienne. Edward himself, who had likewise passed over to the continent, waited the country as far as St Omer; but the French king, determined to avoid a battle, prohibited his general, the constable of Bourbon, from engaging, though his army was much superior to that of the prince.

of Wales. With the flower of his troops, however, he pursued Edward from St Omer to Hesdin, where he defied him to a pitched battle; but the latter disregarding his bravadoes, marched to Calais, and embarked for England. After his departure, John assembled the states of Paris, where he showed to fully the necessity of assisting him in the defence of the kingdom, that they voted him an army of 30,000 men during the war. To supply other exigencies they revived the duty on salt, and added other imposts; but at the same time appointed a committee to take care that the money was solely appropriated to the public service. John's satisfaction from these grants, and the suppression of some disturbances which happened about this time, was soon overcast by the news, that the Black Prince had marched with an army of 12,000 men from Bourdeaux; and, after ravaging the Agenois, Quercy, and the Limousin, had entered Berry. Young Edward had penetrated into the heart of France with this handful of forces, in hopes of joining the duke of Lancaster in Guienne. But he soon found that this was impracticable: the country before him was too well guarded to permit his advancing further; and all the bridges behind were broken down, which prevented a retreat. In this embarrassment his perplexity was increased, on learning that John was actually at the head of 60,000 men to intercept him. He at first thought of retreating: but finding that impossible, he determined calmly to await the approach of the enemy; and notwithstanding the disparity of forces, to hazard a battle. It was at *Maupertuis*, near Poitiers, that the armies came in sight. John might easily have starved the English into his own terms; but such was the impatient valour of the French nobility, and their certainty of success, that it might have been equally fatal to attempt repressing their ardour. In the meantime, while both armies were drawn out, and expecting the signal to begin, they were stopped by the cardinal of Perigord, who attempted to be a mediator between them. However, John, who thought himself sure of victory, would listen to no other terms than the restitution of Calais; with which the Black Prince refusing to comply, the onset was deferred till the morning, for which both sides waited in anxious suspense. During this interval, the prince strengthened his post; and placed 300 men in ambush, with as many archers, who were commanded to attack in flank during the heat of the engagement. Having taken these precautions, he ranged his army in three divisions; the van was commanded by the earl of Warwick, the rear by the earls of Salisbury and Suffolk, and the main body by himself. In like manner, the king of France arranged his forces in three divisions: the first commanded by the duke of Orleans; the 2^d by the dauphin, attended by his younger brothers; while he himself led up the main body, seconded by his youngest and favourite son, then about 14 years of age. As the English were to be attacked only by marching up a long narrow lane, the French suffered greatly from their archers, who were posted behind the hedges. Upon emerging from this danger, they were met by the Black Prince himself at the head of his chosen troops, who made a furious

onset upon their forces, already in great disorder. A dreadful overthrow ensued: those yet on the recoiled on their forces; while the English, who had been placed in ambush, took that opportunity to increase the confusion, and confirm the rout. The dauphin and the duke of Orleans were among the first that fell. The king made the utmost efforts to retrieve by his valour what his rashness had forfeited; but his courage was unable to stem that consternation which had prevailed through his army; and his cavalry flying, he found himself exposed to the enemy's fury. At length, spent with fatigue, and despairing of success, he cried out, that he would surrender to his cousin the prince of Wales. The honour of taking him, however, was reserved for a much more ignoble hand; he was seized by Dennis de Morbec, a knight of Arras who had been obliged to fly his country for murder. April following, the prince conducted his prisoner through London, attended by an infinite concourse of people of all ranks and states. Edward's modesty on this occasion was remarkable: The king of France was clad in royal apparel, and mounted on a beautiful white steed, while the prince himself rode by his side on a little horse, and in very plain attire.

(31.) FRANCE, HISTORY OF, FROM THE DEATH OF K. JOHN, TO HIS DEATH. This disastrous defeat, which happened in 1356, almost entirely ruined the French affairs; and the miseries which ensued from this cause were greatly augmented by intestine commotions. The dauphin, who had now assumed the government, was altogether unable to govern a turbulent people in such a crisis. An assembly of the states, which he called, limited the power of the prince, recalled former ministers, and demanded the liberty of the king of Navarre; the treasurer of the crown was murdered by Marcel's order. The countess, whom Marcel employed, was dragged to an altar where he had taken refuge, and instantly put to death. The bishop of Paris resented the indignity done to the church; and Marcel avenged his fate, by murdering both the countess and the bishop, that his clothes were stained with their blood. The prince indignantly asked him, if he was involved in the same detraction? when Marcel affected to provide for his safety by putting him a blue hood, the badge of the adherents of Navarre. The public disorders were augmented by the king of Navarre; and, tho' the dauphin even assured, that he had administered a dose of poison to him, he was obliged to pay him some appearance of regard. A scheme was even formed to change the government, to vest all the power in the commons, and leave the king an empty name; but though this was favourably received by the city of Paris, it was rejected by the rest of the kingdom. The dauphin was likewise recognized as regent by the states general, and the inhabitants of Picardy and Champagne took up arms in his cause. In this critical situation, the minds of the people were heightened by an unexpected evil. The peasants, who had been long oppressed by the nobles, rose in great numbers to revenge themselves; the castles of the nobility were

and daughters ravished, and themselves cruel deaths. At last they were obli-

The duke of Orleans sent off 12,000 men, near the city of Paris; 12,000 sent by the king of Navarre: 9000, besieged the town of Meaux, where the duke and three other ladies of high rank had been shut up by an officer in the service of the king.

Amidst these confusions, Marcel perished of his own railing; and the independent people of the nation were disappointed. His most dangerous enemy, the duke of Navarre, who had seduced the Norman and English adventurers, turned Edward into France, and began to seek their fortunes; where they assumed the name of *Companions*. By such a competitor the dauphin was reduced to extremity, when his hopes were revived by a proposed proposal from his rival, of peace on the terms. On the expiration of the year, Edward III. again set sail for England, before Calais with 1200 sail, and the title of *king of France*, and augmented to 120,000 men. The dauphin was left on the defensive; closing Paris, and allowing the English to ravage the country, and to penetrate through into Champagne; but Rheims, where he was to have been crowned, baffled their attempts. From Champagne, therefore, he retired into Burgundy; pillaging Tonnerre, and Avalon. Burgundy was ransomed for 20,000 marks, and a like sum was paid for the city of Amiens. At last, after a long and destructive war, Edward arrived at Paris; but the prudent dauphin and citizens had rendered it impregnable to famine, as well as to the assaults of arms.

Thus the war went on till 1360, when Edward was inclined to peace, as is said, by a conspiracy, to which his army was exposed, and camped in the fields around Chartres. Considering all his victories, the French showed the least favour to his claim of succession; for Navarre, was a dangerous rival, and a son of the dauphin deprived him of all advantage from his valour and military skill. Conditions of peace were opened at Breteigny; and on the following conditions, viz. That Edward should pay for his ransom, at different times, three millions of crowns of gold (about 1,200,000 of our money); Edward should ever renounce all claim to the kingdom of France, and should remain possessed of Poitou, the Agenois, Perigord, the Limousin, Rouergue, Angoumois, and other distant quarters, together with Calais, Guisnes, and Ponthieu. Other stipulations were made in favour of the allies of England, as a security for the peace. On John's return, he found his army unable to ratify these terms. He was harassed, at the head of an exhausted state; his army without discipline, and his peasants in insubordination. These had risen in great numbers, and one of their chiefs assumed the title of *lord of God and the terror of Man*. A monk, named *John Gouge*, also got himself proclaimed king; and he soon caused as

many calamities by his devastations, as the real king had brought on by his misfortunes. Such was the state of that wretched kingdom on the return of its captive monarch: and yet such was his absurdity, that he prepared for a crusade into the Holy Land, before he was well replaced on the throne. Had his exhausted subjects been able to equip him, it is probable he would have gone through with it; but their miseries were such, that they could not pay his ransom. This was a breach of treaty that John could not submit to; and he was heard to express himself in a very noble manner upon the occasion. He therefore actually returned to England, and yielded himself a prisoner, since he could not be honourably free. He was lodged in the Savoy, the palace where he had resided during his captivity; and soon after closed a long and unfortunate reign, by his death, in 1364, the 36th year of his age.

(32.) FRANCE, HISTORY OF, FROM THE DEATH OF JOHN, TO THOSE OF CHARLES V, AND THE KING OF NAVARRE. Charles V. surnamed *the Wise*, succeeded his father, and, merely by a fine conducted policy, even though he met with some defeats, restored his country once more to tranquillity and power. He quelled the *Companions*, who had long been a terror to the peaceable inhabitants. He invaded them in a body, and led them into Castile against Peter, surnamed *the Cruel*, whom his subjects had dethroned, and who, by an alliance with the English, endeavoured to be re-instated on the throne. In consequence of these alliances, the English and French again came to an engagement; the one side commanded by the Black Prince; the other, by Henry of Transtamare, and Bertrand du Guesclin, one of the most consummate generals and accomplished characters of the age. However, the usual good fortune of the English prince prevailed; the French lost above 20,000 men, while only 4 knights and 40 private men on the side of the English were slain. But these victories, however glorious, were attended with very few good effects. The English, by their frequent levies, had been quite exhausted. Charles, on the other hand, cautiously forbore coming to any engagement; but allowed his enemies to waste their strength in attempts to plunder a fortified country. When they retired, he followed forth, and possessed himself of such places as they could not defend. He first seized Ponthieu; Abbeville opened its gates to him; St. Valois, Rec, and Crotoy, imitated the example; and the whole country was in a little time reduced. The southern provinces were invaded by his generals with equal success; while the Black Prince, without supplies, and waited by a consumption, returned to England, leaving his affairs in the south of France in a deplorable condition. In this exigence, the resentment of Edward III. was excited to the utmost pitch; and he resolved to take signal vengeance of his enemies on the continent. But the fortunate occasion was elapsed; and all his designs were marked with ill success. The earl of Pembroke and his whole army were intercepted at sea, and taken prisoners by Henry king of Castile. Sir Robert Knollys, one of his generals, at the head of 30,000 men, was defeated by Bertrand du Guesclin; while the

duke of Lancaster, at the head of 25,000 men, saw his troops diminished one half by flying parties, without ever coming to a battle. At last, the English affairs were totally ruined by the death of the Black Prince and king Edward. On this news, the armies of Charles attacked the English on all sides. One, under the duke of Burgundy, entered Artois; another entered Auvergne, under the duke of Berry; a third acted in Guienne under the duke of Anjou; and the forces in Bretagne were under Guesclin: the king himself led a powerful body of troops, to repair any accident that should happen. The constable Guesclin joined the duke of Burgundy, who found it difficult to oppose Sir Thomas Felton and the Senechal of Bourdeaux. Soon after his arrival, the constable attacked and defeated them, making them both prisoners of war. This victory was so well pursued, that, at the close of 1377, Bayonne, Bourdeaux, and Calais, with their dependencies, were all the places left to England on the continent. Thus Charles established once more the house of Valois on the throne of France, but did not long enjoy his good fortune. He died in 1379, aged 44, from the effect of the poison formerly given him by the king of Navarre. The immediate operation of this poison had been suspended by the skill of a physician sent by the emperor Charles IV. Not long before his death, Charles had commenced a process against the king of Navarre for this crime, who was deprived of his possessions in Normandy, as well as his lordship of Montpellier. He did not long survive the monarch he had murdered. His death was singular and terrible; for having been afflicted with the leprosy, he had been obliged to use bandages dipped in sulphur and brandy, which by the carelessness of a page, took fire, and he was burnt to death.

(33.) FRANCE, HISTORY OF, FROM THE DEATH OF K. CHARLES V, TO THOSE OF HENRY V, AND CHARLES VI. Charles V. was succeeded by his son Charles VI. surnamed the *Well beloved*, who at his accession was only 12 years of age. The duke of Anjou, brother to the late king, had been appointed guardian during his minority; but he being totally unfit for the office, readily resigned it to the dukes of Burgundy and Bourbon, the former, uncle to the king by his father's side, the latter by his mother's. None of these tutors, however proved faithful to their trust. The duke of Anjou seized the plate and treasures of the late king. At that time Q. Joan, infamous for her profligacy, reigned in Naples. She had appointed one Charles Durazzo, her relation, to succeed her in the throne; but the wretch murdered his benefactress, who with her last breath revoked her grant of the kingdom, and bestowed it on the duke of Anjou. His influence at the French court enabled him to waste the treasures of the kingdom in support of his pretensions; though he proved ultimately unsuccessful, his forces being constantly defeated, and his designs frustrated by the superior skill of his adversary. The duke of Burgundy, instead of instructing his pupil in the ways of virtue, indulged him in every kind of vicious pleasure, hoping thereby to gain his favour afterwards. The citizens of Paris, oppressed by taxes, broke out into tumults, and were quelled with difficul-

ty; while the mal-administration of Philip involved the nation in hostilities with the Flemings. Philip invaded their country with an army of 80,000 men, with whom was the young king, and the principal nobility of France. The first operations were favourable to the Flemings; but they were at length totally defeated on the banks of the river Lis, where their leader, with 25,000 of his followers, perished. This victory was followed by the submission of the whole country; but the satisfaction of the king was disturbed by new seditions and revolts in Paris, and other great towns. His return, however, at the head of a victorious army, soon reduced them to their duty, and several of the revolted cities were severely punished; while the duke of Anjou's death had freed him from dependence on his tutors, and assumed the reins of government into his own hands in 1384. The genius, which Charles displayed in his early years, raised the hopes of the nation. The young king, whose marriage began to be a subject of attention to the council, insisted upon seeing the person designed for his consort. An interview was accordingly procured between him and Isabella, daughter to the duke of Bavaria, whom he fell in love with and afterwards married. His administration was for some time prudent and vigorous. He conciliated the affections of his people by restoring their privileges, and relieving them from the taxes which had been imposed in his minority. He reduced the Flemings to the authority of the duke of Burgundy; detached 15,000 archers and 1500 men at arms, to assist the Scots in their incursions into England; and in 1385 sent out a prodigious armament against England. A vast fleet was assembled in the harbour of Sluys, and a very numerous army in the neighbourhood. According to some, the armament consisted of 1200 ships, 20,000 foot differently armed, 20,000 cavalry, and 20,000 cross-bow men. There was besides a vast wooden edifice or floating tower contrived for the protection of the soldiers who landed; but all these preparations were at length brought to nothing by the duke of Berry, who being inimical to this measure, carried on his progress so slowly, that he did not arrive at Sluys till September, when no invasion was practicable. A storm drove the greatest part of the fleet on shore, and beat the wooden edifice to pieces; the remains of it was given to the duke of Burgundy with the port of Sluys, which was very commodious, and of the utmost importance. This was only a prelude to more extraordinary calamities. The Sieur de Craon, a profligate nobleman, having been entrusted by the court with a considerable sum of money for the duke of Anjou, which he had dissipated at Venice; but, by the credit of the duke of Orleans, the king's brother, he was pardoned, and returned to court. Here he attempted to assassinate Oliver Clifton the constable, who he suspected of having promoted his disgrace. This veteran hero was attacked by a band of ruffians, against whom he defended himself with wonderful intrepidity, when at last he fell, receiving more than 50 wounds. Happily, however, he recovered; while the assassin fled for protection to the duke of Brittany. The king commanded he should be given up to him in exchange

duke answered, that he knew nothing of such the king not crediting, marched with forces into his territories. When the arrested at Mans, the king was seized with a fever; but could not be prevailed upon to take physic. On the 5th of August 1391, he marched all day in the heat of the sun, a pale, ragged, wild-looking fellow, darted behind a tree, and laying hold of the bridle rein, cried out, "Stop! where are you going? You are betrayed; and immediately threw again into the wood. The king passed not a little disturbed; and soon after one of his pages, who rode behind and carried his sword, overcome with heat, fell asleep, and let it fall from the helmet which was carried by the page. The king, hearing the noise, looked about; receiving the page lifting the lance, killed him immediately: then riding furiously with his sword drawn, he struck on every side of him, and every person, till he broke his sword; upon which one of his gentlemen leaped up behind him and seized his arm. He fell soon after, and lay as if dead; he was carried back in a waggon to Mans. He lay two days in a lethargy, after which he recovered a little, and expressed great concern for the blood he had shed in his delirium. The king rejoiced at the news of his recovery; but soon discovered, that he no longer possessed that strength of judgment for which he had formerly been remarkable. Hence a regency became necessary; and the competition for it brought out the characters of the queen and duke of Burgundy. The former was a beautiful and accomplished princess; but vindictive, intriguing, without affection, and easily accessible to flattery and every impulse of lawless passion. The duke of Burgundy was equally remarkable for his various accomplishments, but notwithstanding his alliance with Valentina daughter of the king of Milan, he was engaged in many illicit amours, and among the rest, with his own daughter Isabella. During the king's illness he aspired at the regency: but the administration was committed to the duke of Burgundy. For some months the health and understanding of the king seemed to be restored; but in 1393 it was again disturbed by another accident. At an entertainment given at the marriage of one of the king's attendants, six masques entered the apartment disguised like satyrs, in linen clothes covering their bodies, and stuck over with down. These they seized the king and five lords. The duchess of Burgundy paid no attention to the king though she did know him. Mean time the duke of Orleans, in diversion ran a lighted torch against one of the masques. His whole dress was instantly in a flame, and the fire communicated to the rest. The king, notwithstanding the dreadful situation he was in, called out, *Save the king; save the king*. On which the duchess of Berri, recollecting that it must be him with whom she had conversed in a conversation, wrapped him in her cloak, and served him. Only one of the rest escaped jumping into a cistern of water; the other four perished in the flames. The terror which the accident instantly occasioned a relapse; and the king lived delirious at intervals as long as he

lived. While in this state he was intractable by every person, except Valentina duchess of Orleans. So great was her ascendancy, that in those superstitious times it was supposed by many to be the effect of magic; others, ascribed it to her charms; and this produced her a number of enemies, particularly the duchess of Burgundy; and the quarrel between the ladies soon extended to their husbands. They did not however neglect the administration of public affairs; they strove to conciliate the parliament by preserving the rights of the commons; and they endeavoured to check gaming, and to substitute manly and martial exercises in its place. During his lucid intervals, Charles resumed the government: and as the war with England still continued, though in a languid manner, the French monarch, had an interview with Richard II. king of England, to put an end to hostilities, of which both were weary. Still, however, their claims were so difficult to be adjusted, that they could only conclude a truce for 25 years; during which space it was hoped that a lasting peace might be established. Richard gave up Cherbourg to Charles, and Brest to the duke of Brittany: a marriage was also concluded betwixt the king of England and Isabella the daughter of Charles, though the latter was then only 7 years of age; but it was never consummated. During this unfortunate reign, France was still farther weakened by the succours sent to the Hungarians against the Turks. On this fatal expedition upwards of 1000 of the bravest knights were sent under John Count of Nevers, eldest son of the duke of Burgundy; the count of Eu constable of France; John de Vienne admiral of France; and the count of Marche, a prince of the blood royal; together with De Courcy, one of the most experienced captains in Christendom. The prudent counsels of this veteran, however, were not obeyed by the youthful warriors. Attacking the enemy rashly, they were all either killed or taken prisoners. Notwithstanding this, assistance was sent, in 1400, to Wenceslaus emperor of Germany; and the duke of Orleans acquitted himself so well that he acquired the duchy of Luxemburg for himself, and left his ally satisfied: but while the friendship of France was thus courted by foreign powers, the kingdom itself was in the most miserable situation. The king's distemper daily gained ground; while the interests of the contending parties kept the nation in a ferment. The most violent animosity took place betwixt the dukes of Orleans and Burgundy. The former, by his own interest with the queen, and the ascendancy of his duchess over the king, got the better of his rival, and was made lieutenant general and governor of the kingdom; but having presumed to levy new imposts on the people, and oppressing also the churchmen, whom he ought to have let alone, he was deprived of his authority, and obliged to yield to the duke of Burgundy. For some time, however, these powerful rivals were kept within bounds by the mediation of the duke of Bourbon, who seems to have been the only grandee of a pure and unspotted character; but by his death in 1404, the unhappy nation was left exposed to their fury. In 1405, the queen and duke of Orleans again seized the administration; but were soon deprived of it by the

the voice of the people. During this period Charles and his children were abandoned to distress; but they were relieved by the duke of Burgundy on his obtaining the regency; and Isabella, with the duke of Orleans, was obliged to retire from Milan. A sudden return of the king's reason for a much longer time than usual, now deprived both parties of their power; and the administration was vested in the queen and a council of princes of the blood. The two rival dukes, prohibited from interfering in public affairs, exercised themselves in hostilities against the English, with whom the truce had been lately concluded. They were encouraged to this infraction of the treaty by the unsettled situation of the affairs of Henry IV.: but proving unsuccessful, the truce was renewed, after obtaining restoration of the princess Isabella, who had been married to Richard II. The failure of their enterprises produced a new scene of discord betwixt the dukes, who mutually threw the blame upon each other. By the intreaties of the duke of Berry they were apparently reconciled; but the duke of Burgundy pretended friendship only to take the more signal vengeance. To this he was now further inflamed by jealousy. Having hired a band of ruffians, the duke was one evening attacked by 18 of them while attended only by two pages. A Norman, whom the duke had deprived of an employment, headed the assassins, and attacked the duke. At the first blow he cut off his hand, at the second he struck him from his mule, and at the third put an end to his life. His wife Valentina died soon after. The duke of Burgundy escaped to Flanders: and the whole nation was rent into two factions, called the *Burgundians* and *Armagnacs*; the latter being the title of the party of the duke of Orleans, from Armagnac, his father-in-law. A dreadful confusion ensued: the duke of Burgundy returned to France, and extorted a pardon from the unhappy king, who could no longer resist him: and it will give some notion of the state of the kingdom, that 2000 perished in one tumult in the capital. The king was alternately the prisoner of each party, and alternately transferred the power, as he happened to fall into their hands. This was thought by Henry V. of England a favourable opportunity to recover those grants that had been formerly ceded. But previously, to maintain the appearance of justice, he sent ambassadors to Paris, offering perpetual peace and alliance, if put in possession of those provinces which had been taken from the English, and to espouse Catharine, the French king's daughter, with a suitable dowry. Though the French court was at that time averse to war, yet the exorbitance of these demands could not be complied with; and Henry probably made them in these hopes. He therefore assembled a great fleet and army at Southampton; and having allured all the military men in the kingdom to attend him, from the hopes of conquest, he put to sea, and landed at Harfleur, at the head of an army of 6000 men at arms, and 24,000 foot, mostly archers. His first operations were upon Harfleur; which promised to surrender at a certain day, unless relieved before that time. The day arriving, and the garrison still resolving to defend the place, Henry ordered an *assault to be made, took the town by storm, and*

put all the garrison to the sword. From the victor advanced farther into the country which he now laid waste. But although the English made a feeble resistance, yet the climate was against the English; a contagious dysentery rying off three 4ths of Henry's army. In this situation he had recourse to an expedient common enough in that barbarous age. He challenged the dauphin, who commanded the French army, to single combat. This challenge was rejected by the French at last seemed to unite at the prospect of the common danger. A number of 14,000 men at arms, and 40,000 foot bled under count Albert, and was now posted to intercept Henry's weakened forces on their march. The English monarch, when it was too late, began to repent of so rashly making an invasion of a country where disease and a powerful enemy everywhere threatened him with destruction. He therefore thought of retiring into Calais, but this retreat, which was both painful and dangerous, Henry took every precaution to intercept his troops with patience and perseverance: and he set them the brightest example of fortitude and resolution. He was continually harassed by small parties of the enemy; and whenever he attempted to pass the Somme, he saw troops on the opposite side ready to oppose his passage. However, he seized, by surprise, a passage near St. Quintin, and there he safely carried over his army. But the enemy was still resolved to intercept him, and after passing the small river of Teuclange, he was surprised to observe from the heights the whole French army drawn up on the plains of Agincourt; and so posted, that it was impossible to avoid coming to an engagement. The battle accordingly took place, in which the English gained a victory, the most remarkable of any recorded in history. See AGINCOURT. This victory, gained on the 25th of October 1415, was however attended with no immediate success. Henry still retreated, after the battle of Agincourt, and carried his prisoners to Calais, and from thence to England. In 1517, he once more landed with an army of 25,000 men in Normandy; and intended to strike a decisive blow for the crown of France. That wretched country was now in a deplorable situation. The whole kingdom was rent as one vast theatre of crimes. The duke of Orleans was assassinated by the duke of Burgundy, and the duke of Burgundy, in his turn, by the treachery of the dauphin. The duke's son, to revenge his father's death, entered into a treaty with the English; in which the king promised to revenge the murder of the late duke of Orleans. Henry, therefore, proceeded without opposition. Several towns and provinces fell into his approach; the city of Rouen was taken, likewise Pontoise and Gisors. He even threatened Paris, and obliged the court to remove to Bourges. At this city the duke of Burgundy, who had been upon him the protection of the French king, obliged Henry to ratify that treaty formerly concluded, by which the crown of France was to be transferred to a stranger. The imbecility in which Charles had fallen, made him passive in the execution of this remarkable treaty; and Henry dictated the principal articles were, That Henry

neefs Catharine; that king Charles the title and dignity of king for life; y should be declared heir to the ould be intrusted with the present; that France and England should ted under one king, but should still pective laws and privileges; that unite his arms with those of king e duke of Burgundy, to depress and aphin and his partisans. CE, HISTORY OF, FROM THE DEATH- LES VI, TO THE CORONATION OF l. Charles VII. succeeded his father throne. Nothing could be more de- his situation on assuming the crown. were masters of almost all France; : though but an infant, was invested

with regal power by legates from Paris. The duke of Bedford was at the head of a numerous army, in the heart of the kingdom, while the duke of Burgundy, who had entered into a firm confederacy with him, seconded his claims. Yet, notwithstanding these favourable appearances, Charles found means to break the leagues formed against him, and to bring back his subjects to their natural interests and their duty. However, his first attempts were unsuccessful. Wherever he endeavoured to face the enemy he was overthrown; and he could scarcely rely on the friends next his person. His authority was insulted; every advantage was gained against him; and a battle fought near Verneuil, in which he was totally defeated by the duke of Bedford, seemed to render his affairs altogether desperate. But as the English could not keep the field without new supplies, Bedford was obliged to retire to England; and in the mean time his vigilant enemy recovered from his late consternation. Dumois, one of his generals, at the head of 2000 men, compelled the earl of Warwick to raise the siege of Montargis; and this advantage, slight as it was, began to make the French suppose that the English were not invincible. But they soon had still greater reason to triumph, and a new revolution was produced by means the most unlikely. In the village of Domremi, near Vaucouleurs, there lived a country girl, about 27 years of age, called *Joan de Arc*. She had been a servant at a small inn; and had submitted to those hardy employments which fit the body for the fatigues of war. She was of an irreproachable life, and had hitherto discovered none of those enterprizing qualities which appeared soon after. She contentedly fulfilled the duties of her situation, and was remarkable only for her modesty and religion. But the miseries of her country was one of the greatest objects of her compassion. Her mind, inflamed by these objects, began to feel several impulses, which she was willing to consider as the inspirations of heaven. Convinced of this, she had recourse to one Baudricourt, governor of Vaucouleurs, and informed him of her destination by heaven to free her native country. Baudricourt treated her at first with neglect: but her importunities prevailed; and willing to make a trial of her pretensions, he gave her some attendants, who conducted her to the court, which at that time resided at Chinon. The French court were probably sensible of the weakness of her pretensions; but they were willing to make use of every artifice to support their declining fortunes. It was therefore given out, that Joan was inspired; that she had discovered the king among the number of his courtiers, although without any distinction of his authority; that she had told him alone some secrets; and that she had demanded, and minutely described, a sword in the church of St Catharine de Fierbois, which she had never seen. In this manner, the minds of the vulgar being prepared for her appearance, she was armed cap-a-pie, and shown to the people. She was then brought before the university; and they, willing to second the imposture, declared that she had actually received her commission from above. When her mission was completely blazoned, the next aim was to send her against the enemy. The English

were then besieging Orleans, the last resource of Charles, and every thing promised a speedy surrender. Joan undertook to raise the siege; and girded herself with the miraculous sword. Thus equipped, she ordered all the soldiers to confess themselves before they set out; she displayed a consecrated banner, and assured the troops of certain success. Such confidence soon raised the spirits of the French army; and even the English, who pretended to despise her, felt secretly the terrors of her mission. A supply of provisions was to be conveyed into the town; Joan, heading some French troops, covered the embarkation, and entered Orleans at the head of the convoy. While leading her troops along, a dead silence and astonishment reigned among the English; and they regarded with religious awe that temerity, which they thought nothing but supernatural assistance could inspire. But they were soon roused from their amazement by a sally from the town; Joan led on the besieged, bearing the sacred standard in her hand, encouraging them with her words and actions, bringing them to the trenches, and overpowering the besiegers in their own redoubts. In attacking one of the forts, she was wounded in the neck with an arrow; but instantly pulling out the weapon with her own hands, and getting the wound quickly dressed, she hastened back to head the troops, and to plant her victorious banner on the ramparts of the enemy. These successes continuing, the English found it impossible to resist troops animated by such superior energy; and Suffolk, who conducted the attack, thinking that it might prove extremely dangerous to remain any longer in the presence of such a victorious enemy, raised the siege, and retreated with all imaginable precaution. From being attacked, the French in turn became the aggressors. Charles formed a body of 6000 men, and sent them to besiege Jargeau, whither the earl of Suffolk had retired, with a detachment of his army. The city was taken; Suffolk yielded a prisoner; and Joan marched into the place in triumph. A battle was soon after fought near Patay, where the English were worsted, as before; and the generals Seales and Talbot were taken prisoners. The raising of the siege of Orleans was one part of the maid's promise to Charles; the crowning him at Rheims was the other. She now declared that it was time to complete that ceremony; and Charles, by her advice, set out for Rheims at the head of 12,000 men. The towns through which he passed opened their gates to receive him; and Rheims sent him a deputation, with its keys, upon his approach. The ceremony was there performed with the utmost solemnity; and the *Maid of Orleans* (for so she was now called) seeing the completion of her mission, desired leave to retire. But the king could not think of parting with her; he pressed her to stay so earnestly, that she at length complied.

(35.) FRANCE, HISTORY OF, FROM THE CORONATION OF CHARLES VII, TO THE EXPULSION OF THE ENGLISH. A tide of success followed this solemnity; Laon, Soissons, Chateau Thierry, Provins, and many other fortresses submitted on the first summons. The English, discomfited and dispirited, fled on every quarter; not knowing whether to ascribe their misfortunes to the power

of sorcery or to a celestial influence; terrified at both. They now found deprived of the conquests they had gained as the French had formerly found their power. Their own divisions entered them for carrying on the war; and of Bedford saw himself divested of his power in the country, without being able to stop the enemy's progress. In order, therefore, to the declining state of his affairs, he resolved Henry VI. crowned king at Paris, that the natives would be allured to obedience by the splendor of the ceremony. In 1430, accordingly crowned, the vassals swore fealty and homage. But it was now too late to perform the ceremonies of a coronation to give a turn to the generality of the kingdom had declared against them, and the remainder only waited an opportunity to follow their example. A civil war ensued soon after, which, though it promised to promote the English cause in France, served to render it odious. The duke of Burgundy, at the head of a powerful army, laid siege to Compiègne; and the Maid of Orleans, thrown herself into the place, contrary to the wishes of the governor, who did not think of the company of one whose authority would be less than his own. The garrison, however, was struck at her appearance, and believed themselves invincible. But their joy was of short duration. Joan having the day after her arrival made a sally, and twice driven the enemy from the trenches, she was at last obliged to retire, placing herself in the rear, to protect the rear of her forces. But in the end attempting to draw her troops into the city, the gates were closed, and the bridge drawn up by order of the governor, who is said to have long wished for an opportunity of delivering her up to the English. Nothing could exceed the joy of the English at having taken a person who had been so long a terror to their arms. Te Deum was sung on this occasion; and it was hoped, that the appearance of this extraordinary person would restore to the English their former victories and courage. The duke of Bedford was no sooner informed than he purchased her of the count Vendôme, who had made her his prisoner, and ordered her to be committed to close confinement. The opinion of both nations was at that time so greatly affected, that nothing was too absurd to gain credit. Afore, from her successes, was regarded as a saint; she was now, upon her captivity, considered as a sorceress, forsaken by the demon who had seduced her a temporary and fallacious assistance. Accordingly it was resolved to send her to be tried for witchcraft; and the bishop of Beauvais, a man devoted to the English, presented a petition against her for that purpose to the university of Paris, who were so mean as to grant the request. Several prelates, among whom the cardinal of Winchester was the only Englishman, were appointed her judges. They held their court in Rouen, where Henry resided; and she, clothed in her former military apparel, and chained with irons, was produced before them. Her behaviour there no way disgraced her former gallantry; she betrayed neither weakness

submission; but appealed to God and the truth of her former revelations. In the end, she was found guilty of heresy and witchcraft, and sentenced to be burnt alive. But previous to this sentence, they were resolved to make her recant her errors; and at length so far prevailed upon her, that her spirits were entirely broken by the hardships she was obliged to suffer. She publicly declared herself willing to recant, and never more to give way to the vain delusions. This was what they desired; and willing to give her some appearance of mercy, they changed her sentence into perpetual imprisonment, and to give her bread and water. But their rage was not satisfied. Suspecting that the female dress she had consented to wear, was disagreeable to her, they purposely placed in her apartment of men's apparel, and watched for the opportunity of their temptation. Their artifices prevailed, and struck with the sight of a dress in which she had gained so much glory, threw off her perukes, and put on the forbidden garment. The monks caught her equipped in this manner; they considered as a relapse into her former errors. No recantation would suffice, pardon would be granted. She was condemned to be burnt alive in the market-place of Paris; and this infamous sentence was accordingly executed. One of the first misfortunes which she felt after this, was the defection of the Duke of Burgundy; who had for some time seen the error of his conduct, and wished to break an old connection, that only served to involve him in ruin. A treaty was therefore concluded between him and Charles, in which he agreed to assist him in driving the English from France. This was a mortal blow to their arms, and such was its effects upon the population, that they killed several of the duke of Burgundy's subjects, who happened to be there. It perhaps have hastened the duke of Bedford's death, who died at Rouen a few days after; and the Earl of Cambridge was appointed his successor in the regency of France. From this period English affairs became irretrievable. The Duke of Burgundy returned once more to his duty. John of Monmouth, who commanded it, only effected for the safe retreat of his troops to Normandy. That ground was continually, though not entirely, wasted by the French; and although their towns found waste, and their towns depopulated, they found protection from the weak divisions of the English. At length both sides began to grow weary of a war, which, carried on but feebly, was yet a burden which either could support. A truce, therefore, for twelve months, was concluded in 1443. No sooner was this settled, than Charles employed his repairing those numberless ills to which France had so long been exposed. He established discipline among his troops, and justice among his governors. He revived agriculture, and improved his nation. Thus being prepared once more for the field, he took the first favourable opportunity of breaking the truce; and Normandy was invaded by a powerful army; one commanded by himself, a 2d by the duke of Brittany, a 3d by the count of Alençon, and a 4th by the Duke of Burgundy.

Every place opened its gates almost as soon as the French appeared. Rouen alone promised to hold out; but the inhabitants clamoured so loud, that the duke of Somerset, who commanded, was obliged to capitulate. The skirmish of Fourmings was the last stand which the English made. However, they were put to the rout, and above 1000 were slain. All Normandy and Guienne, that had so long acknowledged subjection to England, were lost in one year; and the English saw themselves entirely dispossessed of a country which for above 3 centuries they had considered as annexed to their native dominions. Calais alone remained; and this was but a small compensation for the blood and treasure which had been lavished in that country, and only served to gratify ambition with a transient applause. Thus, in 1450, the power of the English in France was entirely destroyed; and Charles deservedly obtained the surname of *the Victorious*.

(36.) FRANCE, HISTORY OF, FROM THE DEATH OF CHARLES VII, TO THAT OF LEWIS XI. The satisfaction of Charles was now greatly diminished by domestic misfortunes. The dauphin, forgetting the duty he owed his father, had already impeded his conquests by his seditious intrigues. He had used every endeavour to thwart the designs of his ministers, and it was said that he had poisoned Agnes Soreille, his father's favourite mistress. He had married Charles's daughter to the duke of Savoy; which Charles resented by a declaration of war against the duke, but had been persuaded to recall it, to prosecute the war against Guienne, which made part of the dominions of the English. At last weary of the disobedience of his son, he commanded him to be arrested; but Lewis withdrew to Franche Comté, and afterwards to Brabant; of which the duke of Burgundy (then sovereign of the country) was no longer apprised, than he ordered him to be supplied with every necessary, and treated with all imaginable respect. He refused to see him, however, until he should obtain the approbation of his father; on which Lewis having in vain attempted to draw in the duke, employed himself in sowing dissension betwixt his benefactor and his son the count of Charolois, while he himself was receiving a pension of 12,000 crowns annually from the father. Thus he at last destroyed the domestic peace of his benefactor, while his unnatural behaviour created continual suspicions in the mind of his father. Charles was repeatedly informed that his own domestics, along with his undutiful son, were in a conspiracy against his life. The miserable monarch, therefore, in continual fear of being poisoned, and having none in whom he could repose any confidence, obstinately refused for some days to take any nourishment; and when at last prevailed upon by the importunities of his attendants to do so, his son had been so long incapable of receiving food, so that he died for want of sustenance in 1461. His body, neglected by his unnatural son, was interred at the expense of Tannegui de Chatell, who had been his faithful companion. On Charles's death, his son Lewis XI. succeeded him. He did not even attempt to conceal his joy at his father's death. He pretended much friendship for the Count of Charolois, son to the duke of Bur-

gundy, and even conferred upon him a pension of 12,000 crowns annually; but all this show of affection soon degenerated into a mortal aversion on both sides. Some differences which took place between the courts of France and Castile produced an interview betwixt the two monarchs Lewis, and Henry, surnamed the *Impotent*. They met at Mauleon on the confines of Navarre: but their negotiations came to nothing. In his negotiations with the duke of Burgundy, Lewis proved more successful; persuading him to restore some towns on the Somme, which had been ceded by Charles VII. and which rendered the duke master of Picardy. By this transaction he effectually ensured the hatred of Charolois, while he eminently displayed his own duplicity; for though he had agreed to retain in those towns the officers appointed by the duke, he was no sooner in possession of them, than he nominated others in their stead. Brittany was at this time governed by Francis a weak but generous prince, and whose defect of capacity was supplied by the abilities of his ministers. Him Lewis grossly insulted, but as Francis found himself unable to oppose such a powerful adversary alone, he joined in a close alliance with the duke of Burgundy and the count of Charolois. The conspiracy was joined by several of the principal French nobility, and though the secret was confided to upwards of 500 persons, not one of them ever divulged it. Lewis, finding matters become very critical, marched with an army towards the capital, which the count of Charolois already refused. A battle ensued, in which both princes exerted themselves to the utmost. About 1500 perished on each side, but the count of Charolois remained master of the field. Lewis, however, entered the capital; where he endeavoured, by concession, to conciliate his subjects; in which he succeeded so well, that though the insurgents were above 100,000, they were unable to make themselves masters of the city. At last a treaty was set on foot betwixt Lewis and the count of Charolois; by which the latter obtained the towns formerly ceded, with Boulogne, Guines, Peronne, Mondidier, and Royé, as a perpetual inheritance. By granting favours to the other confederates, the league was broken; and the moment that Lewis found himself freed from danger, he protested against the whole treaty in presence of some confidential members of parliament, and therefore waited the first favourable opportunity, to crush one by one those who had been ready by their united efforts to destroy him. He gained over the duke of Bourbon, one of the most able of the confederates, while, by the discontents betwixt the dukes of Brittany and Normandy, he was enabled to secure the neutrality of the former, and to recover from the latter some territories which he had unwillingly ceded to him. In 1467, Philip duke of Burgundy, from his amiable qualities surnamed *The Good*, died, and left his dominions to his son Charles, count of Charolois. That impetuous prince, an implacable enemy of Lewis, had entered into a secret treaty with Francis; but Lewis had driven the Bretons from the posts they occupied in Normandy, before the duke of Burgundy could pass the Somme. Lewis, however, concluded a peace with Brittany; and, determi-

ned to have a personal interview with the duke of Burgundy. This took place in 1468; and Peronne, a city of Picardy, but belonging to the duke of Burgundy, was appointed as the place of rendezvous. To this place Lewis repaired attended only by Cardinal Balue, the duke of Bourbon, and the count of St Pol, constable of France, seemingly without reflecting that he was entering an hostile city, where he might be treated at the pleasure of the duke, who was his mortal enemy. Indeed he had not been long in the place when he began to see his error; and by the daily course of Burgundian lords and other persons of rank, who were his avowed enemies, he became alarmed for his personal safety. His fear suggested a worse measure than the former; he requested apartments in the castle, when he was in the power of his rival in a moment to make him a close prisoner. This event accordingly took place, and that through the arts and machinations of Lewis himself. His design had been from the beginning to keep the duke of Burgundy constantly employed in domestic war. For this purpose he had, before his interview with Charles, excited the inhabitants of Liege, who were subject to the duke of Burgundy, to revolt. It is most probable that he did not imagine the effects of this treachery would so soon begin to appear. At the very time, however, that Lewis was in the castle of Peronne, the people of Liege revolted, seized the bishop and governor; and having massacred great numbers retired to the capital. Charles was informed of this massacre, with the additional circumstance, that the ambassadors of Lewis were seen animating the insurgents. He flew into a transport of rage; commanded the castle-gates to be shut; denouncing the severest vengeance on the perfidious monarch. Lewis, however, though greatly and justly alarmed, did not neglect to take the proper methods for securing himself. He distributed large sums of money among those officers, to whom he imagined the duke was most inclined to pay any regard, and by splendid promises and presents endeavoured to allay the resentment of his other enemies. At last the resentment of Charles having subsided, he entered into a treaty with the king, and concluded it upon much the same terms as those which had been agreed upon before. It was not long, however, before this new alliance was dissolved. A confederacy against Lewis, whom neither promises nor threats could bind, was formed betwixt his own brother the duke of Normandy, and the duke of Burgundy; but before their measures were ripe for execution, Lewis had already commenced hostilities. The duke of Burgundy, as a peer of France, was summoned to parliament; and on his refusal, the constable of St Pol made himself master of Quintin. Several other cities were soon afterwards seized; Baldwin, the natural brother of Charles, corrupted by Lewis, deserted his cause; the proud spirited duke, was at last obliged to solicit a peace. This however, was of no long duration. Charles, encouraged by Edward IV. of England, his brother-in-law, began once more a league with the dukes of Brittany and Guienne, the latter being the king's brother. But these prospects were suddenly overcast by the death

duke of Guienne, which was universally supposed to have been occasioned by poison, and it was as universally looked upon as the author. The abbot of St Jean d'Angeli was fixed as the immediate perpetrator of the deed: on the day appointed for his trial he was strangled in his cell; and this also was with probability, supposed to have been the deed of Lewis, who after the death of his brother inherited the territory of Guienne, and extended to the dominions of France. By this conduct of the French monarch, Charles was incensed, that he vowed the most effectual vengeance against the French, and threatened sacrifice to the memory of the duke of Burgundy every one who now fell into his hands. A number of Nivelle were massacred without distinction of sex or age; Beauvais resisted his attacks; and Charles wreaked his fury on the oppressors. Having entered the country of Caux, he seized the cities of Eu and St Valery, burnt the suburbs, and wasted the whole country as far as Rouen. Lewis, on the other hand, determined to dissolve the league between the duke of Burgundy and Edward IV. of England. Accordingly he encamped with his army on the frontiers of Brittany, while the duke was obliged to continue a truce for a year; and the duke of Burgundy himself was obliged to follow his example. In a very little time, he again began to conspire with the king of England against Lewis and a general invasion was determined upon. Edward embarked the sea with an army of 10,000 men, while Charles assembled all his forces to join him. Lewis, however, still avoided the storm. Charles, instead of depending on the assistance of Edward, entered France at the head of 15,000 archers and 1,000 men at arms, laid siege to Nuiz on the Rhine; while the constable of St Pol, instead of delivering up the towns as he had promised, secured his allies, and enabled Lewis to dissolve a confederacy, which, had it been vigorously maintained, might have involved him in the present difficulties. To procure the departure of Edward, however, he was obliged to consent to a tribute of 75,000 crowns, as well as to settle on the king himself 50,000 crowns for life; betrothing also the dauphin to the eldest daughter of the king of England. The duke of Burgundy exclaimed loudly against this treaty: but Edward persisted in his resolution; and it was accordingly concluded at a place called *Pecquigny*, near Amiens; but in such a manner as showed the little confidence the two sovereigns reposed in each other. A power was reserved by Edward, for the duke of Burgundy to accede to the treaty; but the latter haughtily replied, that he was able to support himself without the assistance of England; and that he would make no peace with Lewis till six months after the return of Edward. To this resolution he adhered; but no sooner was the term expired, than he concluded a truce with Lewis for 9 years. The constable of St Pol, having rendered himself obnoxious to all parties by his complicated treachery, fled to Mons in Hainault; but the duke of Burgundy had already agreed to deliver him up, on condition of receiving his estates and moveables as the price of his treachery.

Thus Lewis, without any qualification but cunning, falsehood, and duplicity, got rid of all his enemies except the duke of Burgundy, whose growing power rendered him a constant object of jealousy and terror. The duke's own imprudence however, soon proved his ruin. Having rashly entered into a war with the Swiss, he was defeated in the first engagement with the loss of his military chest and baggage, with his plate and jewels, supposed to be the richest in Europe. His disappointment on this occasion was so great, that he was seized with a severe sickness, from which he had hardly recovered when he returned his mad scheme of conquering the Swiss. Another battle ensued; in which, after an obstinate dispute, Charles was defeated with the loss of 18,000 men, himself escaping with difficulty. This disaster was followed by the defection of most of his allies; the duke of Lorraine recovered Nancy, and great part of his dominions, which Charles had seized; while the latter overwhelmed with shame and disappointment, spent his time in solitude and inactivity. From this he was at last roused by the misfortunes, which fell upon him in such quick succession. He now invested the city of Nancy; and in this, as well as in every other instance, he acted against the advice of his best officers; and the consequences were still more fatal than before. The duke of Lorraine advanced with a strong body of Germans to the relief of the city, while Charles had scarcely 4000 men to oppose him. His troops were therefore easily defeated, and himself, notwithstanding the most heroic efforts of valour, hurried away in the crowd. The count de Campobasso, an Italian nobleman in whom he put a great deal of confidence, but who was in reality a traitor, had deserted with about 80 men in the beginning of the engagement. He left 12 or 15 men about the duke's person, with strict orders to assassinate him in the tumult; and this order they punctually complied with; the body of Charles being found two days after the battle pierced with three wounds. The news of Charles's death was received with the utmost joy by Lewis, whose sole object now was to unite the territories of the duke of Burgundy to his own. This might be done in two ways; one by a match betwixt the dauphin and Mary the heiress of Burgundy; the other, by marrying her to the duke of Angoulême, a prince of the royal blood of France, and on whom Mary had shewn some inclination to bestow herself. The king, however, to whom duplicity and falsehood seem to have been absolutely necessary, chose a third method, more agreeable to his character. The match with the dauphin was attended with such circumstances as rendered it evidently impracticable. The disparity of age was very great, the dauphin being only 8 years old, and the princess 20; the Flemings were besides averse; but, Lewis insisted upon the match, at the same time that he endeavoured to make himself master of her dominions by force of arms. He addressed circular letters to the principal cities of Burgundy; representing, that the duchy had been given up by king John to the male heirs of his son Philip; and that now, when there were extinct by the death of Charles, the territory reverted of course to the crown. He corrupted the

governors of some towns, and seduced the inhabitants of others to rise against their governors; whilst he himself, at the head of an army, prepared to enforce obedience from those who could not be worked upon by other methods. Thus Burgundy was entirely reduced; but Flanders could not be brought under subjection either by fair means, force, or fraud. In his conduct for this purpose, indeed, Lewis displayed the most detestable treachery and falsehood. To render Mary odious to her subjects, he negotiated with her ministers, and prevailed upon them to disclose to him some of the most important state secrets; after which he communicated their letters to the states of Flanders. This double treachery, however, did not answer his purpose. Mary was thus induced to bestow herself upon the emperor Maximilian; and Lewis had the mortification to find, that all his arts had contributed only to aggrandize a rival power, whom he had already sufficient cause to dread. To remedy this oversight, he entered into an alliance with Edward IV. of England, whom he had inspired with a jealousy of his brother Clarence, in order to prevent a match betwixt that nobleman and the princess Mary, which had also been in agitation. Thus a peace was concluded between the two monarchs, to continue during the life of each, and for a year after. The marriage of Mary with Maximilian effectually secured the independence of Flanders; while the return of the prince of Orange to the party of that princess extended the flames of war once more to the cities of Burgundy. The French were on the point of being totally expelled from that country, when Maximilian unexpectedly made proposals of peace. A truce was concluded; but without any term limited for its duration, or without any conditions stipulated in favour of the Burgundians; so that the whole country was quickly after reduced by Lewis. The king now, freed from the apprehension of foreign enemies, turned his vindictive disposition against his own subjects; over whom, under pretence of former rebellions he exercised the most insupportable tyranny. The principal victim to his sanguinary disposition on this occasion was James d'Armagnac duke of Nemours, one of the first noblemen in the kingdom but who had formerly appeared a zealous confederate against him in the league in which Edward and Charles were concerned. The unfortunate nobleman, fled to a fortress named *Carlat*, situated among the mountains of Auvergne. Here he was besieged by the Seigneur de Beaujeu, who had married Anne the daughter of Lewis. The place, however, was almost impregnable to any force; so that his enemies were obliged to make the most solemn promises of safety to induce him to surrender. By these he was at last persuaded to trust himself in the hands of the faithless tyrant; who no sooner had him in his power than he shut him up in the Bastille in an iron cage, and reprimanded the judges because they had released him from this close confinement during the time of his examination. The judges reluctantly condemned him to be beheaded: but the king's cruelty extended beyond the sentence; and he ordered the two sons of the duke, though yet in childhood, to be placed directly under the scaffold,

that they might be covered with the blood of their father: 4000 persons are said to have fallen upon this occasion without any form of law. By these he broke the spirit of the French, and gradually extended the power of France beyond all bounds; so that at last it was only by the king's pleasure. In 1479, Louis XI. or Maximilian, who had lightly abandoned the duchy of Burgundy when he might have retained it, now renewed his claims when it was in his power to enforce them. After some negotiations, and destruction of cities, on both sides, a bloody battle was fought at Guinegate. The Flemings were routed; but as the French fought with too great ardour, the infantry of France rallied, and the battle was renewed with slaughter on both sides. A more decisive victory was afterwards gained by the capture of some Flemish vessels, which induced that people to think of peace. In the same year, however, Lewis, received warning of his approaching end, by a fit of apoplexy with which he was seized in 1480. He lay speechless for some time, after which he recovered in some degree, but his illness neither prevented him from pursuing his schemes, nor from using the same measures to attain them. He seized the duke of Bourbon, the only nobleman in France whose power could give him any suspicion; yet, notwithstanding his age, and the interest of the dauphin, he kept him prisoner in the castle of Amboise. He married his own consort, and endeavoured to alienate his own son with aversion towards her. But the death of Charles, king of Naples, he became master of the country of Provence; but his satisfaction was marred by a second stroke of apoplexy. However, he revived, and, again began to pursue his ambitious intrigues. The death of Burgundy, who perished by a fall from his horse, inspired him with new views; and he betrothed his son to the infant daughter of the emperor. Thus he offended Edward IV. of England, whose eldest daughter Elizabeth he had previously contracted to the dauphin; and which would have undoubtedly ensued, had it not been for the death of Edward. This was followed after by that of Lewis himself, who, after having exhausted the skill of the physician, and the clerical order with prayers and processions to avert the impending stroke, expired after a reign of 23 years; during which he was detested by his subjects, and equally despised by his neighbours; notwithstanding which he obtained the title of *Most Christian* pope, which his successors have ever since retained. Notwithstanding the dark character of his reign, it must be allowed, that he laid the foundation of the grandeur of the French monarchy. By his arts he deprived the people of their liberties, oppressed the nobility, established a standing army, and even induced the states to render themselves perpetual, which formerly were only convened to support the army which was to keep France in slavery.

(37.) FRANCE, HISTORY OF, FROM THE DEATH OF LEWIS XI, TO THAT OF CHARLES VIII. Charles VIII was only 14 years old, when he succeeded his father Lewis XI, in 1483. But though so young, even at that age, have ascended the throne without any violation of the laws, yet it was judged necessary to have a regent, on account of his delicacy of constitution and want of education. Three competitors appeared, for this important trust, viz. 1. John duke of Bourbon, a prince of the blood, and who had, till the age of 16, maintained the most unblemished character; 2. Lewis duke of Orleans, presumptive heir to the throne, but who, from his being only 20 years old, seemed incapacitated on that account from undertaking such an important office; and 3. Anne, the eldest daughter of Lewis, to whom he latter had, in his last moments, committed the charge of the kingdom, with the title of governor. The claim of this lady was supported by the assembly of the states-general at Tours; and though she was only in the 22d year of her age, the office could not have been more properly bestowed. Being married to Peter of Bourbon, sire of Beaujeu, her title was *the Lady of Beaujeu*; but she acted entirely independent of her husband, who was but of a moderate capacity, and indeed had been recommended to her by Lewis on account of his slender abilities. Left by any other match the House of Bourbon should be too much aggrandized. Her first step was to ingratiate herself with the people by some popular acts; among which one was to punish the instruments of her father's cruelties. One of these, named Oliver le Dain, who, from the station of a barber, had raised himself to the confidence of the king, and had distinguished himself by the invention of new modes of torture, was publicly hanged. Another, named John Doyac, who by continual acts of rapacity had oppressed the people, was condemned to be whipped, to have one of his ears cut off, and his tongue pierced with a hot iron; then taken to his native city of Montferrand, again whipped, and his other ear cut off; after which his estates, as well as those of Oliver, were confiscated. James Cailler, the physician of Lewis, who had availed himself of the terror of death with which the king was influenced, to extort great sums of money from him, was ordered to answer for the immense wealth he had acquired; but he averted the danger by paying a fine of 50,000 crowns. Thus the queen gained the affections of the people; and many of those who were averse to her government. The duke of Bourbon was made constable, an office which he had long desired; but the duke of Orleans behaved so as to exclude all hopes of it. Incensed at the determination of a trifling dispute at tennis against him, by the governors, he exclaimed, that whoever had decided it in that manner "was a liar if a man, or a strumpet if a woman." After this furious declaration he fled to the castle of Beaujeu, where, however, he was soon forced to surrender. He then applied to Henry VII, but that prince, paying little attention to his proposals, he next made his application to the court of Brittany. Here he was received with great marks of esteem, and began to entertain hopes of marrying the daughter of the duke;

but being looked upon with a jealous eye by the nobility, they entered into secret negotiations with Anne, and even solicited her to invade the country. In these however, they stipulated that only a certain number of troops should enter the province, and that no fortified place should remain in the hands of the French. Brittany however was invaded at once by 4 armies, each of them superior to the stipulated number, who quickly made themselves masters of the most important places; while the troops of the duke retired in disgust. Finding at last, however that the entire subjection of their country was determined upon, the nobility began to exert themselves in defence of it; and, inflamed by the enthusiasm of liberty, they raised an army of 60,000 men, and compelled the French to abandon the siege of Nantz. But this proved only a transient success; Anne persevered in her design, and the state of Europe at that time favoured it. England alone was then capable of affording any effectual assistance; and the avarice of Henry prevented him from giving it, which for his own interest he ought to have done. Thus the Bretons were left to defend themselves the best way they could; and having ventured a battle, they were entirely defeated, and most of their leaders taken prisoners. A small body of English, under lord Woodville, who assisted them, were entirely cut in pieces. The duke soon after died by a fall from his horse, leaving his dominions to his daughter Anne, at that time only 13 years of age. The lady Beaujeu, then, finding that the conquest of Brittany would still be difficult, determined to conclude a marriage betwixt the young king of France and the duchess, though the former had already been married to Margaret of Austria, the daughter of Maximilian. This marriage indeed had not been consummated by reason of the tender age of the princess; but she had been sent to Paris for her education, and had for several years been treated as queen of France. In 1491, however, Margaret was sent back to her father: Anne of Brittany for a long time refused to violate the engagements into which she had entered; but at last, finding herself distressed on all sides, and incapable of resisting the numerous forces of France with which she was pressed, she reluctantly consented to the match, and the nuptials were celebrated at Langeais in Touraine. Maximilian, enraged at the double disgrace he had suffered, began, when too late, to think of revenge. France was now threatened by the united forces of Austria, Spain, and England. But this formidable confederacy was soon dissipated. Henry was bought off with money; the immediate payment of 745,000 crowns, and the promise of 25,000 annually ever after, persuaded him to retire into his own country. Ferdinand king of Spain had the counties of Roussillon and Cerdagne restored to him; while Maximilian was gratified by the cession of part of Artois, which had been acquired by Lewis XI. The young king of France agreed to these terms the more readily, that he was bent upon an expedition into Italy, to conquer the kingdom of Naples, to which he claimed a right. Most of his counsellors were against it, but he was inflexible, though Ferdinand king of Naples offered

ed to do homage for his kingdom, and pay him a tribute of 50,000 crowns a-year. He appointed Peter duke of Bourbon regent in his absence; after which he set out with very few troops and very little money. By the way he fell ill of the smallpox, but soon recovering he entered Italy with only 6000 horse and 12,000 foot; he was attended with the most surprising success, traversing the whole country in six weeks, and becoming master of Naples in less than a fortnight. Had Charles acted up to the character generally given him, he might have raised his name as high as any hero of antiquity. His behaviour, however, was very different. He amused himself with feasts and shows; and leaving his power in the hands of favourites, they shared it with any who would purchase titles, places, or authority, at the rates they imposed. But while Charles was thus losing his time, a league was concluded against him at Venice; into which entered the pope, the emperor Maximilian, the archduke Philip, Lewis Sforza, and the Venetians. The confederates assembled an army of 40,000 men, commanded by Francis marquis of Mantua; and they waited for the king in the valley of Fornovo, in Parma, into which he descended with 9000 men. On the 6th July 1495 he attacked the allies; and, notwithstanding their great superiority, defeated them, with the loss of only 80 of his own men. Thus he got safe to France; but his Italian dominions were lost almost as soon as he departed. Some schemes were proposed for recovering these conquests; but they were never put in execution, and the king died of an apoplexy in 1498. The premature death of this monarch, in the 28th year of his age, was supposed to have been owing to his irregular life. He was greatly celebrated for his sweet temper and agreeable disposition, which procured him the titles of the *Affable* and *Courteous*. Two of his domestics are said to have died of grief after his death, and his widow abandoned herself to the most pungent sorrow for *seven days*.

(38.) FRANCE, HISTORY OF, FROM LEWIS XII'S ACCESSION TO THAT OF FRANCIS I. By the death of Charles VIII. the crown passed from the direct line of the house of Valois, and Lewis duke of Orleans succeeded. At his accession he was in his 36th year, and had long been taught in the school of adversity. During the administration of the Lady Beaujeu, he had been constantly in disgrace; after his connections with the duke of Brittany, he had spent a considerable time in prison; and though afterwards set at liberty by Charles, he had never possessed any share of his favour. Towards the conclusion of that reign, he fell under the displeasure of the queen; and had continued at his castle of Blois till he was called to the crown. He had been married in early life, and against his will, to Jane the youngest daughter of Lewis XI. a princess of an amiable disposition, but deformed, and supposed to be incapable of bearing children. Afterwards he entertained thoughts of having this marriage dissolved, and was supposed to possess the affection of the duchess of Brittany before she became queen of France. After the death of her husband, that princess retired to Brittany, where she pre-

tended to assume an independent form; but Lewis having got his marriage with her dissolved by pope Alexander VI. quickly accepted of the queen dowager, which she accepted; but it was stipulated, that if she have two sons, the younger should inherit the duchy. As Lewis, while duke of Orleans, had some pretensions to Naples, he instantly began realizing them. On his accession, he met with in that country much more favourable dispositions than formerly. The pope was interested in him, he had conciliated the friendship of the Venetians; he concluded a truce with the duke Philip; and renewed his alliances with the crowns of England, Scotland, and France. He then entered Italy with an army of 20,000 men, assisted by the Venetians, quickly recovered one part of the duchy, while they conquered the other, the duke himself being obliged to retire to his family to Inspruck. He then attacked Ferdinand of Spain with three armies at once: one by land, and one by sea; but not performing any thing remarkable, he returned to Naples in 1504. In 1506 the Genoese drove out the nobility; chose 8 tribunes, and declared Paul Nuova, a silk-dyer, their king; after which, they expelled the French, and reduced a great part of the Riviera. This occasioned Lewis's return into Italy; in 1507, he obliged the Genoese to surrender; and, in 1508, entered into the league of Cambray, with the other princes who at that time wanted to reduce the overgrown power of the Venetians. Pope Julius II. who had been the first contriver of this league, very soon broke off it; and declared, that if the Venetians restore the cities of Faenza and Rimini, which had been unjustly taken from him, he would be contented. This was refused; and in consequence of the republic received such an insult from Lewis, that they agreed to demand not only the two cities, but whatever else they required. The pope now, instead of making peace, made war on the king, without the least provocation. Lewis assembled his clergy; where it was determined, that in some cases it was lawful to make war on the pope; upon which the king declared against him, and committed the care of his affairs to Marshall de Trivulce. He soon obliged the pope to retire into Ravenna; and in 1512 the duke of Nemours, gained a great victory at Ravenna, but was killed in the engagement; his death the army disbanded for want of pay, and the French affairs in Italy, and elsewhere, fell into confusion. They recovered the duchy of Milan, and lost it again in a few years. Henry VIII. of England invaded France, took Terruon and Tournay; and the Swiss defeated Burgundy with an army of 25,000 men. In this desperate state of affairs the queen mother put an end to the opposition of the king's dangerous enemies by negotiating marriage with Ferdinand of Spain he offered his second son for either of his grandsons, Charles or Lewis, and to renounce, in favour of that marriage, all his claims on Milan and Genoa. This proposal was accepted; and Lewis himself married t

Francis found it impossible to succeed; and at the same time an irreconcilable hatred took between the two monarchs. In 1521, this produced a war; which, however, might have been terminated, if Francis had retreated, but this being refused, hostilities renewed with greater vigour than ever; they concluded till France was brought to the very brink of ruin, Francis himself being prisoner, on the 24th Feb. 1524. This divided the whole kingdom into the utmost confusion. The Flemish troops made continual ravages, and many thousand boors assembled in Alliance, to oppose an invasion from that quarter; Henry VIII. assembled a great army, and threatened the kingdom on that side also; and a party was sent to dispossess the dukes of the regency, and to confer it upon the duke of Vendôme. The constable, however, who, after the death of the king, was head of the House of Bourbon, went on to Lyons, where he assured the regent that he had no view but for her service, and that he would be ready to obey her every command; upon which she formed a council of the best men of the kingdom, and of this she made him president. The famous Andrew Doria, with the French galleys to take on board the French troops under the duke of Vendôme, whom he landed safely in France. Those who were expelled out of the Milanese also made their return again. Henry VIII. under the influence of the pope, resolved not to oppress the oppressed; and he agreed to a truce with the regent for five years. In Picardy the Flemings were repulsed, and count Guise, with the duke of Lorraine, defeated and cut to pieces the German peasants. In the mean time Francis was detained in captivity in Italy: weary of his confinement in that country, the princes of Italy beginning to cabal for his release, he was carried to Madrid; where,

he was presented to the emperor, and together with the assembly of the notables; to whom he proposed the question, Whether he was bound to perform the treaty of Madrid? or, Whether if he did not perform it, he was obliged in honour to return to Spain? To both these questions, the assembly answered in the negative. When the ambassadors delivered their propositions, Charles treated the English herald with respect, and the French one with contempt; which produced a challenge from Francis to the emperor. See DUEL, § 3. All differences, however, were at last adjusted; and a treaty was concluded at Cambray, on the 21st Aug. 1528. By this treaty, the emperor contented himself with reserving his right to the duchy of Burgundy, and to receive two millions of crowns, as the ransom of the king of France's two sons. Of these he was to receive 1,000,000 in ready money: the prince's lands in Flanders belonging to the house of Bourbon were to be delivered up; these were valued at 400,000 more; and the remaining 400,000 were to be paid by France in discharge of the emperor's debt to England. Francis was likewise to discharge the penalty of 500,000 crowns, which the emperor had incurred, by not marrying his niece the princess Mary of England; and to release a rich *Heur-de-lis* which had been many years before pawned by the house of Burgundy for 50,000 crowns. The town and castle of Hesden were also yielded; together with the sovereignty of Flanders and Artois, and all the king's pretensions in Italy. As for the allies of France, they were abandoned to the emperor's mercy, without the least stipulation in their favour; and Francis himself protested against the validity of the treaty before he ratified it, as did also his attorney general before he registered it in parliament; but both of them with the greatest secrecy imaginable. Not long after, the war was renewed with Charles V, who made an invasion into France, but with very bad success; nor was peace

the people to their duty without making many examples: the other behaved with the utmost haughtiness and cruelty; and though the king afterwards remitted many of his punishments, yet from that time the constable became odious to the people, while the family of Guise were highly respected. In 1548, the king began to execute the edicts which had been made against the Protestants with the utmost severity; and, thinking even the clergy too mild in the prosecution of heresy, erected for that purpose a chamber composed of members of the parliament of Paris. At the queen's coronation, which happened this year, he caused a number of Protestants to be burned, and was himself present at the spectacle. He was, however, so much shocked, that he could never forget it; but complained, as long as he lived, that, at certain times, it appeared before his eyes, and troubled his understanding. In 1549, a peace being concluded with England, the king purchased Boulogne from the latter, for the sum of 400,000 crowns; one half to be paid on the day of restitution, and the other a few months after. Scotland was included in the treaty, and the English restored some places they had taken there. This was the most advantageous peace that France had hitherto made with England; the vast arrears which were due to that crown being in effect remitted; and the pension which looked so like tribute, not being mentioned, was in fact extinguished. The earl of Warwick himself, who had concluded the peace, was so sensible of the disgrace suffered by his nation on this occasion, that he pretended to be sick, in order to avoid setting his hand to such a scandalous bargain. This year, an edict was made to restrain the extravagant remittances which the clergy had been in use of making to the court of Rome. With this edict pope Julius III. was highly displeased; and in 1550, war was declared by the king of France against the pope and the emperor. The emperor soon found himself in such danger, that he could not support the pope as he intended, who on that account was obliged to sue for peace. After this, the king continued the war against the emperor with success; reducing Toul, Verdun, and Metz. He then entered the country of Alsace, and reduced all the fortresses between Haguenau and Wissemburg. He failed, however, in his attempt on Strasburgh: and was soon after obliged by the German princes and the Swiss to desist from farther conquests on that side. This war continued with very little interruption, and as little success on the part of the French, till 1557, when a peace was concluded; and in 1559, the king was killed at a tournament by the count de Montgomery, one of the strongest knights in France, who had done all he could to avoid this encounter with the king. The reign of his son and successor Francis II. was remarkable only for the persecution of the Protestants, of whom he made a dreadful slaughter; 1200 died by the hands of the executioner; the waters of the Loire were tinged with their blood, and their bodies, being denied burial, tainted the air. He died in his 18th year, and 2d of his reign, A. D. 1560.

(41.) FRANCE, HISTORY OF, FROM THE DEATH OF FRANCIS II. TO THE MASSACRE OF THE PRO-

TESTANTS UNDER CHARLES IX. succeeded his brother in 1560. Th at last took up arms in their own defence, occasioned several civil wars, the first continued till 1562, when a peace was made by which the Protestants were to have religion, and liberty of conscience. In 1562, a new war broke out anew, and was continued with little interruption till 1569, when peace was concluded upon very advantageous terms for the Protestants. After this, king Charles, having taken the government into his hands, persecuted the Protestants in an extraordinary manner. He invited to court the admiral Coligni, who was of the Protestant party; and cajoled him into a perfect security, notwithstanding the many warnings given him by his friends. On the 22d Aug. 1571, as he was walking in the court to his lodgings, he received a blow in the window, which carried away the 2d of his right hand, and wounded him grievously in the left arm. This he ascribed to the duke of Guise, the head of the Catholic party. After dinner, the king went to pay a visit to the admiral, and amongst others made him this speech: "You have received the wound, but do not suffer." This satisfied the admiral of the king's sincerity, and hindered him from complying with the desire of his friends, who would have forced him away, and who were strong enough to have forced a passage out of Paris, if they had attempted it. In the evening, the queen, Catherine de Medicis, held a cabinet council, in which the execution of the massacre of the Protestants, which had been long meditated, was determined. The council, which was composed of the king, the duke of Anjou, the king's brother, the duke of Nevers; Henry of Angoulême, prior of France, and bastard brother of the king; the marshal de Tavannes; and Albert, count de Retz. The direction of the massacre was given to the duke of Guise. The guards were pointed to be in arms, and the city was ordered to dispose the militia to execute the king's command, of which the signal was the ringing of the bells of the Louvre. Some say, that when the king approached, which was that of midnight, he grew undetermined: that he expressed great horror at shedding so much blood, especially considering that the people whom he was to destroy were his subjects, who had a capital at his command, and in consequence of his word; and particularly the admiral, who was detained so lately by his caresses. The queen, however, reproached him with his indecision, and represented to him the great danger that was in from the Protestants; which obliged him to consent. According to the king's order, however, the king himself urged on the execution, and when it was proposed to him to cut off a few of the heads, he cried out, "I will die, let there not be one left to reproach me for breach of faith." As soon as the signal was given, a body of Swiss Catholic troops, headed by the duke of Guise, the chevalier of Angoulême, accompanied by many persons of quality, proceeded to the admiral's house. Having forced open the doors, the foremost of the assassins

ment; and one of them asked if he was. To this he answered that he was; adding, "Young man respect these gray hairs:" the assassin replied by running him through with his sword. The duke of Guise, growing impatient below stairs, to know if the business was done; and finding that it was, commanded that the body be thrown out at the window. As soon as he lay on the ground, the chevalier, or (as some call him) the Duke of Guise, wiping the blood off the sword with his foot. The body was delivered to the fury of the populace; who, tired of indignities, dragged it to the cemetery, to which they chained it by the feet, a being cut off and carried to the queen; who caused it to be embalmed and sent to the king. The king himself went to see the body upon the gibbet; where a fire being kindled, part was burnt. In the Louvre, the king's brother, the king of Navarre and the prince of Conde were murdered under the same roof. Two of them wounded, and pursued by assassins, fled into the bed-chamber of the queen of Navarre, and jumped upon her bed, begging her to save their lives; and as she went to the door, two more, the king's brothers, rushed into the room, and lay themselves at her feet. The queen came to the window to enjoy this dreadful sight; and the king, seeing the Protestants flying on the other side of the river flying, called for his long gun, and fired at them. In 3 or 4 days many thousands were killed in Paris, by the most cruel deaths which could be invented. Peter Ramus, professor of philosophy and mathematics, after having lost all he had, his belly being first open, was thrown out of a window. This affected Denis Lambin, the king's physician, though a zealous Catholic, he died of grief. The first two days the king denied it was his orders, and threw the whole blame upon the Duke of Guise; but, on the 28th of August, he appeared in the parliament, avowed it, was condemned upon it, and directed a process against himself, by which he was stigmatized as a tyrant. Two innocent gentlemen suffered as his accomplices in a pretended plot against the life of the king, in order to set the crown on the head of the prince of Conde. They were executed by the king; and the king and the queen mother, the king of Navarre and the prince of Conde were spectators of this horrid deed; and at the jubilee to thank God for the execution of it.

FRANCE, HISTORY OF, FROM THE DIABOLICAL MASSACRE OF THE PROTESTANTS, TO THE DEATH OF CHARLES IX. This massacre was confined to the city of Paris alone. On the day of St. Bartholomew, orders had been sent to the governors of provinces to fall upon the Protestants themselves, and to let loose the people upon them; and though an edict was published the end of the week, assuring them of the king's protection, and that he by no means designed to exterminate them because of their religion, yet private orders were sent, of a nature
 . . . PART. I.

directly contrary; in consequence of which, the massacre, or, as, in allusion to the Sicilian vespers; (see ITALY) it was now styled, the *Matins of Paris*, were repeated in Meaux, Orleans, Troyes, Angers, Thoulouse, Rouen, and Lyons; so that in the space of two months 30,000 Protestants were butchered. The next year Rochelle, the only strong fortress which the Protestants held in France, was besieged, but was not taken without the loss of 24,000 Catholics, who besieged it. After this a pacification ensued on terms favourable to the Protestants, but to which they never assented. This year the duke of Alençon was elected king of Poland, and soon after set out to take possession of his new kingdom. The king accompanied him to the frontiers of the kingdom; but during the journey was seized with a slow fever, which had a very dangerous appearance. He lingered for some time under the most terrible agonies both of body and mind; full of remorse, and blood oozing from all the pores of his body. He died on the 30th of May 1572, having lived 33 years, and reigned 13. It is said, that after the dreadful massacre, this prince had a fierceness in his looks, and a colour in his cheeks which he never had before. He slept little, and never sound. He waked frequently in agonies, and was obliged to have soldiers to compose him again to rest.

(43.) FRANCE, HISTORY OF, TO THE DEATH OF HENRY III. During the first years of the reign of Henry III. who succeeded his brother Charles, the war with the Protestants was carried on with indifferent success on the part of the Catholics. In 1575, a peace was concluded, called by way of eminence the *Edict of Pacification*. This edict gave occasion to the Guises to form an association in defence, as was pretended, of the Catholic religion, afterwards known by the name of the *Catholic League*. In this league, though the king was mentioned with respect, he could not help seeing that it struck at the very root of his authority: for, as the Protestants had already their chiefs, so the Catholics were, for the future, to depend entirely upon the chief of the league; and well, by the very words of it, to execute whatever he commanded, for the good of the state, against any, without exception of persons. The king to avoid the bad effects of this, by the advice of his council, declared himself head of the league; and of consequence recommenced the war against the Protestants, which was not extinguished as long as he lived. The faction of the Duke of Guise, in the mean time took a resolution of supporting Charles cardinal of Bourbon, a weak old man, as presumptive heir of the crown. In 1584, they entered into a league with Spain, and took up arms against the king; and though peace was concluded the same year, yet in 1587, they again proceeded to such extremities, that the king was forced to fly from Paris. Another reconciliation was soon after effected: but it is generally believed that the king from this time resolved on the destruction of Guise. Accordingly, finding that this nobleman still behaved towards him with his usual insolence, the king caused him to be murdered, as he was coming into his presence, by his guards, on the 23d Dec. 1587. The king himself died . . .

long survive him; being stabbed by one James Clement, a Jacobine monk, on the first of August 1589. His wound at first was not thought mortal; but his frequent swooning quickly discovered his danger; and he died next morning, in the 39th year of his age, and 16th of his reign.

(44.) FRANCE, HISTORY OF, TO THE DEATH OF HENRY IV. Before the king's death, he nominated Henry Bourbon, king of Navarre, to be his successor, but as he was a Protestant, or at least greatly favoured their cause, he was at first owned by very few except those of the Protestant party. He met with the most violent opposition from the members of the Catholic league; and was often reduced to such straits, that he went to people's houses under colour of visits, when in reality he had not a dinner in his own. By his activity and perseverance, however, he was at last acknowledged throughout the kingdom, to which his abjuration of the Protestant religion, no doubt, contributed. As the king of Spain had laid claim to the crown of France, Henry, no sooner found himself in a fair way of being firmly seated on the throne, than he formally declared war against that kingdom; in which he at last proved successful, and in 1597 entered upon the quiet possession of his kingdom. The king's first care was to put an end to the religious disputes which had so long distracted the kingdom. For this purpose, he granted the famous edict, dated at Nantes, April 13, 1598. Soon after, he concluded peace with Spain upon very advantageous terms. This gave him an opportunity of restoring order and justice throughout his dominions; of repairing all the ravages occasioned by the civil war; and abolishing all those innovations which had been made, either to the prejudice of the prerogatives of the crown or the welfare of the people. His plans of reformation, indeed, he intended to carry beyond the boundaries of France. If we may believe the duke of Sully, he had in view no less a design than the new-modelling of all Europe. He imagined that the European powers might be formed into a kind of Christian republic, by rendering them as nearly as possible of equal strength; and that this republic might be maintained in perpetual peace, by bringing all their differences to be decided before a senate of wise, disinterested, and able judges; and then he thought it would be no difficult matter to overturn the Ottoman empire. With a view, it is now thought, of executing this grand project, but under pretence of reducing the exorbitant power of the house of Austria, Henry made immense preparations both by sea and land; but if he really had such a design, he was prevented by death from attempting to execute it. He was stabbed in his coach by one Ravillac, a friar, on the 12th of May, 1610.

(45.) FRANCE, HISTORY OF, TO THE DEATH OF LEWIS XIII. On the murder of Henry IV. the queen mother assumed the regency. Ravillac was executed after suffering severe tortures. It is said that he made a confession, which was so written by the party who took it down, that not one word of it could ever be read, and thus his instigators and accomplices could never be discovered. The regency during the minority of Lewis XIII. was a scene of cabals and

intrigues of the courtiers. In 1617, the king assumed the government himself, banished the queen mother to Blois, caused her favourite minister d'Ancre to be killed, and chose for his minister the famous cardinal Richelieu. In 1620, a war broke out between the Catholics and Protestants, which was carried on with the greatest fury on both sides. Both parties soon became weary of such a destructive war; and a peace was concluded in 1621, by which the edict of Nantes was confirmed. This treaty, however, was of no long duration. A new war broke out, which lasted till the year 1628, when the edict of Nantes was again confirmed; only the Protestants were deprived of all their cautionary towns, and consequently of the power of defending the frontier in time to come. This put an end to the wars on account of religion in France. It is estimated, that in these wars above a million of men lost their lives; that 150,000,000 livres were expended in carrying them on; and that 9 cities, 40 villages, 2000 churches, 2000 monasteries, and 100,000 houses, were burnt or otherwise destroyed during their continuance. The next year, the king was attacked with a slow fever which nothing could allay, an extreme depression of spirits, and a disgusting swelling in his stomach and belly. A year after, however, he recovered, to the great disappointment of his mother, who had been full of hopes of regaining her power. She was arrested but escaped into Flanders, where she remained during the rest of this reign. Richelieu, by his masterly train of politics, though himself was to an enthusiast for popery, supported the Protestants of Germany and Gustavus Adolphus against the house of Austria; and, after quelling all rebellions and conspiracies which had been formed against him in France, died some months before Lewis XIII. in 1641.

(46.) FRANCE, HISTORY OF, TO THE DEATH OF LEWIS XIV. Lewis XIV. surnamed *the Great*, succeeded to the throne when only five years of age. During his minority, the kingdom was torn by factions of the great, and the divisions between the court and parliament. The prince of Condé flamed like a blazing star; sometimes a patriot, sometimes a courtier, and sometimes a rebel. He was opposed by the celebrated Turenne, who from a Protestant had turned Papist. The war of France was involved at once in civil and foreign wars; but the queen mother having made choice of Cardinal Mazarine for her first minister, found means to turn the arms even of Cromwell against the Spaniards, and so divided the domestic enemies of the court, that when Lewis assumed the government into his own hands, he found himself the most absolute monarch that had ever reigned upon the throne of France. He had the good fortune, on the death of Mazarine, to put the domestic administration of his affairs into the hands of Colbert, who formed new systems for the treasury, commerce, and manufactures of France, which he carried to a surprising height. The minister, ignorant and vain, was blind to the patriotic duty of a king, promoting the interests of his subjects only to answer the purposes of greatness; and by his ambition he embroiled

th all his neighbours, and wantonly rendered many a dismal scene of devastation. By politic and unjust revocation of the edict of 1685, with the dragging the Protestants that followed it, (see DRAGOONING,) he led many to take shelter in England, Holland, several parts of Germany, where they established manufactories, to the great prejudice of France. He was so blinded by flattery, that he attributed to himself the divine honours paid to pagan emperors of Rome. He made and treated for his conveniency: and in the united himself a confederacy of almost all the princes of Europe; at the head of which was King William III. He was so well served that he made head for some years against this; and France seemed to have attained the height of military glory, under the conduct of renowned generals Conde and Turenne. (UNITED PROVINCES.) At length, having deceived the English by his repeated infidelities, was under the duke of Marlborough, and the Austrians under prince Eugene, rendering the latter part of Lewis's life as miserable as the beginning of it was splendid. His reign from 1688 to 1711, was one continued series of calamities; and he had the mortification of seeing those places taken from him, which, the former part of his reign, were acquired at the expense of many thousand lives. (See ENGLAND—75.) Just as he was reduced, old and feeble, to the desperate resolution of collecting his people and dying at their head, he was deserted by the English Tory ministry deserting the king, withdrawing from their allies, and concluding peace of Utrecht in 1713. The last years of his reign were all embittered by domestic troubles; which, added to those he had already experienced of a public nature, impressed him with a morbid melancholy. He had been for some time afflicted with a fistula; which, though successful, never afterwards affected his health. The day before the peace, his only son, the duke of Burgundy, died, together with the duchess and their son; and the only remaining child was at the point of death. The king himself survived the month of Sept. 1715; but on the 1st of that month expired, leaving the kingdom to his great-grandson Lewis, then a minor.

FRANCE, HISTORY OF, TO THE REIGN OF LEWIS XV. By the last will of Lewis XIV. he bequeathed the regency during the minority of his grandson, upon a council, at the head of which was the duke of Orleans. That nobleman, disgusted with a disposition which gave him no casting vote, appealed to the parliament at Paris, who set aside the will of the late king and declared him sole regent. His first acts were extremely popular. He restored to parliament the right of remonstrating against the edicts of the crown, and forced those who had enriched themselves during the former reign to restore their estates. He also took every method to efface the marks occasioned by the unsuccessful wars of his predecessor had engaged; promoted commerce and agriculture; and, by a close alliance with Great Britain and the United Provinces, to lay the foundation of a lasting tranquil-

lity. This happy prospect, however, was soon overcast by the intrigues of Alberoni the Spanish minister, who had formed a design of recovering Sardinia from the emperor, Sicily from the duke of Savoy, and of establishing the house of Stuart on the throne of Britain. To accomplish these purposes, he negotiated with the Ottoman Porte, Peter the Great of Russia, and Charles XII. of Sweden; the Turks intended to resume the war against the emperor; the two latter to invade Great Britain. But as long as the duke of Orleans retained the administration of France, he found it impossible to bring his schemes to bear. To remove him, therefore, he fomented divisions in the kingdom. An insurrection took place in Brittany; and Alberoni sent small parties in disguise into the country, to support the insurgents, and even laid plots to seize the regent himself. All of a sudden, however, the Spanish minister found himself disappointed in every one of his schemes. His partisans in France were put to death; the king of Sweden was killed at Frederickshall, in Norway; the Czar, intent on making new regulations, could not be persuaded to make war upon Britain; and the Turks refused to engage in a war with the emperor, from whom they had lately suffered so much. The cardinal, nevertheless, continued his intrigues: which quickly produced a war betwixt Spain on the one part, and France and Britain on the other. The Spaniards, unable to resist the union of two such formidable powers, were soon reduced to the necessity of suing for peace; and the terms were dictated by the regent of France; and of these the dismissal of Alberoni the Spanish minister was one. A double marriage was now set on foot: the duke of Orleans gave his own daughter Mad. Montpensier, to Don Lewis prince of Asturias, while the infant of Spain was betrothed to her cousin the king of France. From this time the house of Bourbon continued united; both princes being convinced, that it was their interest not to waste their strength in wars against each other. The spirit of conquest having now greatly subsided, and that of commerce taken place throughout the world in general, France became the scene of as remarkable a project in the commercial way as ever was known in any country. John Law, a Scots projector, of uncommon genius, (see LAW,) proposed the plan of a company which might by notes pay off the debt of the nation, and reimburse itself by the profits. The nation being at this time involved in a debt of 200 millions, the regent as well as the people in general were very fond of embarking in his new scheme. The bank was established in 1716, and proceeded at first with some caution; but having by degrees extended their credit to more than 80 times their real stock, they soon became unable to answer their demands: so that the company was dissolved in 1720, the 4th year after it had been instituted. The confusion into which the kingdom was thrown by this fatal scheme, required the utmost exertions of the regent to put a stop to it; and the king, in 1723, took the government into his own hands. The duke then became minister; but he did not long enjoy this post. His irregularities had broken his constitu-

tion, and brought on a number of maladies, under which he soon sunk, and was succeeded in his administration by the duke of Bourbon Conde. The king had been married, when very young, to the infanta of Spain, but the marriage had never been consummated. The princess, however, had been brought to Paris, and for some time treated as queen of France; but as Lewis grew up, he contracted an inveterate hatred against the intended partner of his bed. The minister therefore, at last consented that the princess should be sent back; an affront so much resented by the queen her mother, that it had almost produced a war betwixt the two nations. The dissolution of the marriage of Lewis was the last act of Conde's administration; and the procuring of a new match was the first act of his successor, Cardinal Fleury. The princess pitched upon was the daughter of Stanislaus Leszinski, king of Poland; who had been deposed by Charles XII. of Sweden. This princess was destitute of personal charms, but of an amiable disposition; and though, perhaps, she never possessed the love of her husband, her excellent qualities commanded his esteem; and the birth of a prince, soon after their marriage, removed all fears concerning the succession.

(48.) FRANCE, HISTORY OF, UNDER LEWIS XV. TILL THE FAMILY COMPACT. Cardinal Fleury continued the pacific schemes pursued by his predecessors; though they were somewhat interrupted by the war which took place in 1733. Notwithstanding the connection betwixt that monarch and the French nation, however, Fleury was so parsimonious in his assistance, that only 2500 soldiers were sent to relieve Dantzic, where Stanislaus himself resided, and who at that time was besieged by the Russians. This pitiful reinforcement was soon overwhelmed by a multitude of Russians; and Stanislaus was at last obliged to renounce the crown of Poland, though he was permitted to retain the title of king: and that this title might not be merely nominal, the king of France bestowed upon him the duchies of Bar and Lorraine; so that, after his death, these territories were again united to the dominions of France. Fleury steadily pursued his pacific plans; the disputes between Spain and England, in 1737, very little affected the peace of that kingdom; and it must be remembered to his praise, that instead of fomenting quarrels betwixt the neighbouring states, he laboured to keep them at peace. He reconciled the Genoese and Corsicans: and his mediation was accepted by the Ottoman Porte, who carried on a successful war with the Emperor of Germany, but made peace with him at the cardinal's intercession. All his endeavours to preserve the general peace, however, proved at last ineffectual. The death of the emperor Charles VI. in 1740, set all Europe in a flame. The emperor's eldest daughter, Maria Theresa, claimed the Austrian succession. Among the many competitors who pretended a right to share these extensive dominions, the king of France was one. But as he wished not to awaken the jealousy of the European princes by preferring directly his own pretensions, he chose rather to support those of Frederick II. who laid claim to Silesia. This brought on the war of 1740, of which an account

will be found under ENGLAND, § 80, & PRUSSIA. It was terminated in 1748 by the treaty of Aix-la-Chapelle; but to this Lewis secretly meditated a severe vengeance against, only consented, that he might have recruit his fleet and put himself somewhat upon an equality with that formidable monarch. But while he meditated great exploits of this kind, the internal tranquillity of his kingdom was disturbed by violent disputes betwixt the parliaments of France. In the reign of Lewis there had been violent contests betwixt the Jesuits and Jesuits, and the opinions of the Jesuits had been declared heretical by the celebrated bull named *Unigenitus*; the reception of which was enforced by the king, in opposition to the parliaments, the archbishop of Paris, and to the people. The archbishop with the prelates protested against it. The duke of Orleans favoured the bull by inducing the bishops to submit to it; but at the same time stopped the execution which was going on against its opponents. Thus matters passed over till the conclusion of the peace; soon after which the jealousy of the king was awakened by the minister attempting to acquire into the wealth of individuals of the kingdom. To prevent this, they revived the contest about the bull *Unigenitus*; and it was resolved, that professional notes should be obtained of dying persons, that these notes should be signed by priests, who maintained the authority of the bull; and without such notes, no person could obtain the sacrament, or extreme unction. On this occasion the new archbishop and the parliament took opposite sides: the latter imprisoned some of the clergy as refused to administer the sacraments. Other parliaments followed the example of Paris; and a war was instantly kindled between the civil and ecclesiastical departments of the kingdom. In this dispute the king interfered, for he commanded the parliaments to take cognizance of the ecclesiastical proceedings, and commanded them to suspend all prosecutions relative to the refusal of the sacraments; but instead of acquiescing, they presented new remonstrances, refused to attend to any other business, and resolved they could not obey this injunction without violating their duty as well as their oath. They presented the archbishop of Orleans before their tribunal, and ordered all writings, in which his jurisdiction was disputed, to be burnt by the executioner. In the assistance of the military, they enforced the administration of the sacraments to the sick, and to distribute that justice to the subject which they had been originally instituted. They enraged at their obstinacy, arrested and imprisoned four members who had been most obstinately banished the rest to Bourges, Poitiers, and Angers; while, to prevent any impediment to the administration of justice by their absence, letters patent, by which a royal chamber was created for the prosecution of civil and criminal suits was issued. The counsellors refused to plead before these new courts; and the king, finding that the nation was about to fall into a state of anarchy, recalled the parliament. The banished members entered Paris amidst the acclamations of the people; and the archbishop, who still

rage the priests in refusing the sacraments, fled to his seat at Conflans; the bishops of Sens and Troyes were also banished, and their see established; but it was of no long duration. In 1756, the parliament again fell under the censure of the king, by their imprudent persecution of those who adhered to the bull *Unigenitus*. They even refused to register the taxes for carrying on the war. By this Lewis provoked, that he suppressed the 4th and 5th orders of inquest, the members of which acquitted themselves by their opposition. He ordered the bull *Unigenitus* to be respected, prohibited the secular judges from ordering the administration of the sacraments. On this, 15 members of the great chamber resigned their offices, and 124 members of the different parliaments followed their example: and the most grievous disorders took place throughout the kingdom. The attempt was made by a fanatic, named *Damien*, to assassinate the king; and he was actually killed, though slightly, between the ribs, in the presence of his son, and in the midst of his

The assassin was put to the most exquisite tortures; in the midst of which he persisted, in the most obstinate manner, to declare that he had no intention to kill the king; but that his design was only to wound him, that God might enlighten his heart, and incline him to restore peace to the dominions, &c. These expressions, which evidently indicated insanity, had no effect on the judges, who consigned him to one of the most horrid deaths the ingenuity and cruelty of man could invent. This attempt, however, though it had some effect upon the king, as he afterwards banished the archbishop of Paris, and he had been recalled, and accommodated with his parliament once more. The unfortunate issue of the war of 1755, had brought the nation to the brink of ruin, when Lewis implored the assistance of Spain; and on this occasion, the *United Family Compact* was signed; by which, the single exception of the American trade, between France and Spain were naturalized in both kingdoms, and the enemy of the one soon was invariably to be looked upon as the enemy of the other. At that time, however, the assistance of Spain availed very little; both powers were reduced to the lowest ebb, and the arms of France were triumphant in every quarter of the

See ENGLAND, § 82, 83.

FRANCE, HISTORY OF, UNDER LEWIS XV. TO HIS DEATH. The peace concluded at Fontenoy in 1763, though it freed the nation from a destructive and bloody war, did not restore internal tranquillity. The parliament, eager to sue for the victory they had formerly gained over their religious enemies, now directed their efforts against the Jesuits, who had obtained and registered the bull, *Unigenitus*. That once powerful order, however, was now on the brink of dissolution. A general detestation of its members had taken place throughout the whole world. A party formed by them against the king of France, and from which he narrowly escaped, increased the indignation of Europe, and this was further inflamed by some fraudulent practices of which they had been guilty in France.

Le Valette, the chief of their missionaries at Martinico, had, ever since the peace of Aix-la-Chapelle, carried on a very extensive commerce, insomuch that he even aspired at monopolizing the whole West India trade, when the war with Britain commenced in 1755. Leonay and Gouffre, merchants at Marseilles, in expectation of receiving merchandizes to the value of two millions from him, had accepted of bills drawn by the Jesuits to the amount of a million and an half. Unhappily they were disappointed by the vast number of captures made by the British; in consequence of which they were obliged to apply to the Society of Jesuits at large: but they, either ignorant of their true interest, or too slow in giving assistance, suffered the merchants to stop payment. Their creditors demanded indemnification from the society at large; and on their refusal to satisfy them, brought their cause before the parliament of Paris. That body, eager to revenge themselves on such powerful adversaries, carried on the most violent prosecutions against them. In the course of these, the volume containing the constitution and government of the order itself was appealed to, and produced in open court. It then appeared, that the order of Jesuits formed a direct body in the state, submitting implicitly to their chief, who alone was absolute over their lives and fortunes. It was likewise discovered that they had, after a former expulsion, been admitted into the kingdom upon conditions which they had never fulfilled; and to which their chief had obstinately refused to subscribe; consequently that their existence at that time in the nation was merely the effect of toleration. The event was, that the writings of the Jesuits were pronounced to contain doctrines subversive of all civil government, and injurious to the security of the sacred persons of sovereigns; the attempt of *Damien* against the king was attributed to them, and every thing seemed to prognosticate their speedy dissolution. In this critical moment, however, the king interfered, and by his royal mandate suspended all proceedings against them for a year; a plan of accommodation was drawn up, and submitted to the pope and general of the order: but the latter, by his ill-timed haughtiness, entirely overthrew the hope of reconciliation. The king withdrew his protection, and the parliament redoubled their efforts against them. The bulls, briefs, constitutions, and other regulations of the Society, were determined to be encroachments on authority, and abuses of government; the Society itself was finally dissolved, and its members declared incapable of holding any clerical or municipal offices; their colleges were seized; their effects confiscated; and the order annihilated. The parliament having gained this victory, next made an attempt to set bounds to the power of the king himself. They now refused to register an edict which Lewis had issued for the continuance of some taxes which should have ended with the war, and likewise to conform to another, by which the king was enabled to redeem his debts at an inadequate price. The court attempted to get the edicts registered by force, but the parliament everywhere seemed inclined to resist to the last. In 1766, the parliament of Brittany refused the crown a gift of

900,000 livres; in consequence of which, they were singled out to bear the weight of royal vengeance; but while matters were just coming to extremities, the king dropt the process altogether, and published a general amnesty. The parliaments, however, affected to despise the royal clemency; which exasperated the king to such a degree, that he ordered the counsellors of the parliament of Brittany (who had refused to resume the functions of which he deprived them) to be included in the list of those who were to be drafted for militia; and those upon whom the lot fell were immediately obliged to join their respective regiments; the rest being employed in forming the city guard. The parliament of Paris remonstrated so freely upon this conduct of the king, that they also fell under his censure; and Lewis in the most explicit manner declared, that he would suffer no earthly power to interfere with his will; and the parliaments were thus intimidated into submission. The interval of domestic tranquillity was employed by the king in humbling the pride of the pope, who refused to recall a brief he had published against the duke of Parma. On this the French monarch reclaimed the territories of Avignon and Venaissin; and while the pontiff denounced his unavailing censures against him, the marquis de Rochecouart, with a single regiment of soldiers, drove out the troops of the pope, and took possession of these territories. A more formidable opposition was made by the natives of the small island of Corsica; the sovereignty of which had been transferred to France by the Genoese, its former masters, on the condition that Lewis should reinstate them in the possession of the island of Capraria, which the Corsicans had lately reduced. These islanders defended themselves with the most desperate intrepidity; and it was not till after two campaigns, in which several thousands of the bravest troops of France were lost, that they could be brought under subjection. The satisfaction which this unimportant conquest might afford to Lewis, was clouded by the distress of the nation at large. The East India Company had totally failed, and most of the capital commercial houses in the kingdom were involved in the same calamity. The minister, the duke of Choiseuil, by one desperate stroke, reduced the interest of the funds to one half, and at the same time took away the benefit of the survivorship in the tontines, by which the national credit was greatly affected; the altercation betwixt the king and his parliaments revived, and the dissensions became worse than ever. Choiseuil attempted in vain to conciliate the differences; his efforts tended only to bring misfortunes upon himself, and, in 1771, he was banished by the king, who suspected him of favouring the popular party too much. This was soon followed by the banishment of the whole parliament of Paris, and that by the banishment of others; new parliaments being everywhere chosen in place of those who had been expelled. The people were by no means disposed to pay the same regard to these new parliaments that they had done to the old ones; but every appearance of opposition was at last silenced by the absolute authority of the king. In the midst of this plenitude of power, however, which he had so abun-

dently desired, his health daily declined, and a period of his days was evidently at no great distance. As he had indulged himself in sensuality to the greatest excess, they now proved the immediate means of his destruction. His favourite mistress, Madame de Pompadour, who had governed him with absolute sway, had long been dead, and the king had for some time been equally enslaved by the charms of Madame de Barre. At last even her beauty proved insufficient to excite desire; and a succession of mistresses became necessary to rouse the languid appetite of the king. One of these, who was infected with the small-pox, communicated the disease to the king; who died of it, notwithstanding all the assistance given him by the physicians.

(50.) FRANCE, HISTORY OF, UNDER LEWIS XVI. TILL THE AMERICAN TREATY. LEWIS XVI. succeeded his grandfather, in 1774, at the 20th year of his age; and to secure himself against the disease which had proved fatal to his predecessor, submitted to inoculation, with several others of the royal family. Their quick and recovery contributed much to extend that practice throughout the kingdom, and to remove prejudices against it. The king had no sooner regained his health, than he applied himself gently to extinguish the differences which had taken place between his predecessor and the parliaments. He removed those from their employments who had given cause of complaint by their arbitrary and oppressive conduct; and he conciliated the affections of his subjects, by removing the new parliaments and recalling the old ones. But though the prudence of Lewis had suggested to him these measures, he endeavoured still to preserve pure and entire the royal authority. He explained his intentions by a speech in the great chamber of the parliament, which he concluded thus: "That it was his desire to bury in oblivion all grievances; that he should ever behold with extreme disapprobation whatever might tend to create divisions and disturb the general tranquillity; and that his successor would read his ordinance to the assembly from which they might be assented he would suffer the smallest deviation to be made." This ordinance was conceived in the most explicit terms, and was immediately registered by the king's command. The articles of it limited within very narrow bounds the pretensions of the parliaments of Paris: The members were forbidden to look upon themselves as one body with the other parliaments of the kingdom, or to take any step, or assume any title, that might tend towards or imply an union: They were enjoined never to interfere in the administration of public justice, except in the cases of absolute necessity, for which the first president was to be responsible to the king, and it was added, that on their disobedience the Grand Council might displace the parliaments without any new edict. They were still however permitted to enjoy the right of remonstrating, before the registering of any edicts or letters patent, which they might conceive injurious to the welfare of the people, provided they served in their representations the respect due to the throne. But these remonstrances were not to be repeated; and the parliament, if they pre-

, were to register the edict objected to month at farthest from the first day of its issued. They were forbidden to issue which might excite trouble, or in any tard the execution of the king's ordinance they were assured by the king himself, that as long as they adhered to be prescribed, they might depend upon cenance and protection. In short, the which Lewis consented to re-establishments were such, that they were reduced cyphers, and the word of the king used to be the only law in the kingdom. bishop of Paris, who had likewise praised some commotions about the bulls, was obliged to submit; and severely if he should afterwards interfere in such. The final conquest of the Corsicans, voted by the oppression of their government more attempted to regain their liberty the first event of importance which took place this restoration of tranquillity; but the was yet filled with disorder from other scarcity of corn happening to take place at the time that some regulations had been made by M. Turgot, the new financier, the police in great bodies, and committed such that a military force became absolutely to quell them; and it was not till upwards of 500 of them were destroyed, that they were reduced. The king, however, by his bold and vigorous conduct on this occasion, a stop to all riots, and eminently displaying energy as well as prudence in the measures taken for the restoration of the public tranquillity. The humanity of Lewis was next manifested by an edict which he caused to be registered, sentencing the deserters of his army not to work as slaves on the public roads, but punishing them as formerly with death; and giving equal attention to the welfare of his subjects. He seized the moment of peace to fulfil those views of economy, which on his accession he had proposed to his people. Various regulations took place in consequence; particularly the suppression of the *Mulquetaires* and some other corps, being more adapted to the parade of guard than to any real military service, supported at a great expence, without any return of benefit to the state. Particular attention was also paid to the marine; and the appointment of M. de Sartine in 1776, to that office, did honour to the penetration of the king. That minister, fruitful in resources, carried in his application, was incessantly engaged in augmenting the naval strength of his kingdom; and the various preparations that filled the harbours and docks, created no small uneasiness in the English court. The next appointment made in the navy was equally happy, and in one regular and unprecedented. M. Turgot, possessed of integrity and industry, had been able to command the public confidence. In 1776, M. Clugny, intendant general of the navy, had been elevated to the vacant post; and soon after, M. Taboureaux des Reaux

was appointed his successor; and the king associated with him in the management of the finances M. Neckar, by birth a Swiss, and by religion a Protestant. That gentleman, in the preceding reign, had been chosen to adjust some differences between the East India company and the crown; and had discharged his trust in a manner which gained the approbation of both parties. Possessed of distinguished abilities, his appointment would have excited no surprise, had it not been contrary to the constant policy of France, which had carefully excluded the aliens of her country and faith from the controul of her revenue. It was a new instance of enlargement of mind and liberality of sentiment; and will to posterity mark the prominent features of the reign of Lewis XVI. Although the king was of a pacific disposition, and not destitute of generosity of sentiment, yet his own and the public exultation had been openly and constantly proportioned to the success of the Americans in their contest with Britain: the princes of the blood and chief nobility were eager to embark in support of the cause of freedom; and the prudence of the king and his most confidential ministers alone restrained their ardour. The fatal events of the former war were still impressed on the mind of Lewis; and he could not readily consent to expose his infant marine in a contest with a nation who had so long asserted the dominion of the seas, and so lately broken the united strength of the house of Bourbon. At the same time, he was sensible, that the opportunity of humbling the British court should not be entirely neglected, and that some advantages should be taken of the commotions in America. Two agents from the United States, Silas Deane and Dr Franklin, had successively arrived at Paris; and though all audience was denied them in a public capacity, still they were privately encouraged to hope, that France only waited the proper opportunity to vindicate by arms the independence of America. In the mean time, the American cruizers were hospitably received into the French ports: artillery and all kinds of warlike stores were freely sold or liberally granted to the colonists; and officers and engineers, with the connivance of government, entered into their service. Some changes were about this time introduced into the different departments of state. The conduct of M. Neckar in the finances had been attended with universal approbation; and M. Taboureaux des Reaux, his colleague, had resigned, but still retained the dignity of counsellor of state. To afford full scope to the genius of M. Neckar, Lewis determined no longer to clog him with an associate; but, with the title of Director General of the Finances, submitted to him the entire management of the funds and revenue of France. In the following year, count St Germain, secretary at war, died; and the prince of Montbarey, who had already filled an inferior situation in that department, was appointed to succeed him. In the mean time, Lewis's negotiations with foreign courts were not neglected. He concluded a new treaty of alliance with Switzerland; vigilantly observed the motions of the different princes of Germany on the death of the elector of Bavaria; and when questioned by the English

English ambassador, Lord Stormont, respecting the various warlike preparations which were diligently continued through the kingdom, he replied, That at a time when the seas were covered with English fleets and American cruizers, and when such armies were sent to the New World as had never before appeared there, it became prudent for him also to arm for the security of the colonies, and the protection of the commerce, of France. The king was sensible at the same time, that the remonstrances of Great Britain, and the importunities of the United States, would soon compel him to adopt some decisive line of conduct. This was hastened by the capture of Gen. Burgoyne's army. See AMERICA, § 28, 29. The news of that event were received at Paris with unbounded exultation. M. Sartine, the marine superintendant, was eager to measure the naval strength of France with that of Great Britain; the queen, who had long seconded the applications of the American agents, espoused their cause with fresh ardour; and the pacific inclinations of Lewis being overborn, by the suggestions of his ministers and his queen, he at length determined openly to acknowledge the independence of the United States. Dr Franklin and Silas Deane were now acknowledged as public ambassadors from those states to the court of Versailles; and a treaty of amity and commerce was signed between the two powers, in February 1778.

(51.) FRANCE, HISTORY OF, UNDER LEWIS XVI, TILL THE GENERAL PEACE, IN 1783. The duke of Naoilles, ambassador to the court of London, was in March instructed to acquaint that court with the above treaty. At the same time he declared, that the contracting parties had not stipulated any exclusive advantages in favour of France, and that the United States had reserved the liberty of treating with every nation whatever on the same footing of equality and reciprocity. But this stipulation was treated by the British court with contempt; and the recall of Lord Stormont, their ambassador at Versailles, was the signal for the commencement of hostilities.—The events produced by this war will be found under the articles AMERICA, § 29—33; ENGLAND, § 98, 99, 102—104, 106; and INDOSTAN. Here we have chiefly to notice domestic transactions, the measures of the cabinet, and the internal economy of the state. In 1780, new changes in the French ministry took place. M. Bertin had resigned the office of secretary of state; the prince de Montbarey had retired from the post of secretary at war, and was succeeded by the marquis de Segur. But the most important removal was that of M. Sartine, who had for several years presided over the marine department, and whose unwearied application and ability had raised the naval power of France to a height that astonished Europe: but his colleagues in the cabinet loudly accused a profusion, which would have diverted into one channel the whole resources of the kingdom; and his retreat opened a road to the ambition of the marquis de Castries, who was appointed to supply his place. This year, the king fixed on the anniversary of his birth-day to render it memorable by a new instance of humanity, in abolishing for ever the inhuman custom of *putting the*

question, as it was called, by torture; which had been so established by the pages, that it seemed to be an inseparable constitution of the courts of justice. At the same time, to defray the charge he continued to diminish his own exp and sacrificing his magnificence to the his subjects, dismissed at once above 40 belonging to his court. Unhappily, the public discontents were excited near the dismissal of their favourite minister. He had conceived the arduous but popular of supporting a war by loans without the rigid economy which he had introduced all the departments of the royal household the various resources that presented themselves his fertile genius, had supported him against the difficulties that attended this system. Bitterness of temper had not rendered him acceptable to the sovereign and his subjects repeated reforms he had recommended presented as inconsistent with the dignity of the crown: he was therefore in 1781 dismissed his office of comptroller-general; and M. Fleuri, counsellor of state, was appointed to that important department. The defeat of de Grasse happened next year, and impregnated the kingdom with general grief and confidence. Immense preparations were, however, made for the operations of 1783, and in conjunction with the courts of Madrid and the Hague, Lewis determined this year to make the most efforts to bring the war to a conclusion. In the midst of these preparations, the voice of peace was again heard; and Lewis was induced to the proffered mediation of the two great powers in Europe, the emperor of Germany and the empress of Russia. The court of Versailles, who still occupied the post of secretary of state, was appointed to treat with M. de Soubert, the British minister at Brussels, who lately proceeded to Paris to conduct the important negotiation. The way was already prepared for the restoration of the public tranquillity by provisional articles signed at the conclusion of the war between the States of America and Great Britain, and which were to constitute a treaty of commerce to be concluded when that between France and Great Britain took place. Preliminary articles were accordingly agreed upon and signed at Versailles; which were soon after succeeded by the definitive treaty of peace in 1783.

(52.) FRANCE, HISTORY OF, UNDER LEWIS XVI, TO THE ASSEMBLY OF THE NOTABLES. Though the late war had been attended with most brilliant success, and the independence of America seemed to strike deep at the power of her rival's power, yet France herself had not been entirely free from inconvenience. The M. Necker had diminished the public credit by 3 different persons, who had since occupied the post, increased the jealousies of the people, and the failure of the celebrated CAISSE D'ESCOMPTE completed the universal consternation. The plan had been established in 1776. The plan was formed by a company of private adventurers, its capital was fixed at 500,000 l. sterling, and the professed design of the Company was to

short dates, at the rate of 4 per cent per annum: but as this interest could never be an encumbrance on the capital sunk by the proprietors, and was not without the additional power of interest to the amount of their capital, which, were capable of being converted into specie, it was often voluntarily taken by their owners from mere convenience. The reputation was soon raised its stock to sell above par; and it was still at the highest, when, to the shame of the nation, it suddenly stopped on the 2d Oct. 1783. The cause assigned was the extreme scarcity of specie: But the real cause was that the failure arose from a loan made to government; and what confirmation was, that government about the same time stopped payment of the bills drawn upon by their army in America. Whatever the cause of this event, the king was prevailed upon to extend his protection to the company. Subsequent edicts the banks in Paris were ordered to receive the notes of the *Caisse d'Escompte*; and a lottery with a stock of one million, redeemable in 3 years, being sold, the tickets were made purchasable in the *Caisse d'Escompte*. By these expedients public confidence in that bank was restored, and its stock rose to double the original subscription; the bills drawn were at the same time put in a payment, and public credit was restored to the kingdom. Some compensation for expenses that had been incurred during the war, was drawn from a treaty with the States of America. These engaged to repay France in the sum of 16 millions of livres, which had been advanced in the hour of distress; and Lewis consented to receive the same in conversion to the States, in the form of annuities, by 12 equal and annual payments. The general peace was soon after followed by a treaty between France and Holland, which was effected with great address by the Duke of Nemours. It included all the principles which have to cement in the closest union two nations under distinct governments: which they may mutually participate, in time of war, of good or of evil; and in all render the most perfect aid, counsel, and assistance to each other. It also prescribed, if their joint efforts for the preservation of peace were ineffectual, the assistance they were to render each other by sea and land. France was to furnish Holland with 10,000 effective infantry, 12 ships of the line and 6 frigates. Their High Mightinesses, on the other hand, were to contribute to her defence by sea, were to contribute to her defence by land, and 3 frigates; and in case of attack on the territory of France, the naval force were to have the option of turning out a contingent either in money or troops, to the amount of 5000 infantry and 1000 cavalry. If the stipulated succours should be insufficient for the defence of the party attacked, or for the defence of the party attacked, or for the defence of the party attacked, they engaged to assist each other with all their forces, if necessary; however agreed that the contingent of

troops to be furnished by the States general should not exceed 20,000 infantry and 4000 cavalry. It was further added, that neither of the contracting powers should disarm, or make or receive proposals of peace or truce, without the consent of the other: they promised also not to contract any alliance or engagement whatever, directly, or indirectly, contrary to the present treaty; and on any treaties or negotiations being proposed which might prove detrimental to their joint interest, they pledged their faith to give notice to each other of such proposals as soon as made. Thus Holland became the firm ally of that power against which she had formerly aimed the most powerful kingdoms of Europe; while France supporting America against Great Britain, and converting a formidable foe into a useful friend, seemed to have attained a political influence she had never before been possessed of. Notwithstanding these appearances, the seeds of future contention were already sown. The parliament of Paris had taught the people to look with a less envious eye on the lustre of the throne; the war in America had enlarged their political ideas; they had stood forth as the champions of liberty, in opposition to regal power. From this time, instead of blindly acquiescing under the edict of their sovereign, they canvassed each act with candour and impartiality. The dismissal of M. Necker had given very great dissatisfaction to the public; his successor in office, M. de Fleury, had resigned in 1777, and the transient administration of M. d'Orléans had expired in the same year that gave it birth. On his retreat, M. de Calonne was nominated comptroller general. Though acceptable to the sovereign, he did not enter upon his arduous station favoured by the breath of popularity. The bold and judicious measures of Calonne, however, restored credit to the *Caisse d'Escompte* which had stopped payment a few weeks before his accession. His next measure, in 1784, the establishment of the *Caisse d'Amortissement*, or sinking fund, was intended to a still higher degree of applause. The principal measure of 1785, was the establishment of a New India Company; a measure not equally commendable with the preceding, and which therefore excited violent complaints. Although peace had been re-established throughout Europe for 3 years, yet the finances of France seemed scarcely affected by this interval of tranquillity, and it was found requisite to close every year with a loan. The treaty of commerce, which was concluded in 1771 with Great Britain, proved a new source of discontent. It was represented as likely to extinguish those infant establishments, which were yet unable to vie with the manufactures of England that had attained to maturity; and the market that it held out for the wines and oils of France was passed over to France, while the duties of the tariff was paid in the most sinking columns. But when the edict for registering the law of the conclusion of the year, and which amounted to the sum of 3,435,000 *livres* was presented to the parliament of Paris, the murmurs of the people, through the remonstrances of that assembly, assumed a more legal and formidable aspect. The king however signified, that he expected to be obeyed without

farther delay. The ceremony of the registering accordingly took place on the next day; but it was accompanied with a resolution, importing, "that public economy was the only genuine source of abundant revenue, the only means of providing for the necessities of the state, and restoring that credit which borrowing had reduced to the brink of ruin." The king was no sooner informed of this step, than he commanded the attendance of the grand deputation of parliament; when he erased from their records the resolution that had been adopted; and observed, that though it was his pleasure that the parliament should communicate, by respectful representations, whatever might concern the good of the public, yet he never would allow them so far to abuse his clemency, as to erect themselves into the censors of his government. Calonne, however gratified by the approbation of his sovereign, felt deeply mortified by the opposition of the parliament. His attempts to conciliate that assembly had proved ineffectual: and he experienced their inflexible aversion at the critical juncture when their acquiescence might have been of the most essential service. An anxious enquiry into the state of the public finances had convinced him that the expenditure by far exceeded the revenue. In this situation, to impose new taxes was impracticable; to continue the method of borrowing was ruinous; to have recourse only to economical reforms would be found wholly inadequate; and he hesitated not to declare, that it would be impossible to place the finances on a solid basis, but by the reformation of whatever was vicious in the constitution of the state. To give weight to this reform, M. de Calonne was sensible that something more was necessary than the royal authority; he perceived that the parliament was neither a fit instrument for introducing a new order into public affairs, nor would they submit to be a passive machine for sanctioning the plans of a minister, even if those plans were the emanations of perfect wisdom. Though originally a body of lawyers, indebted for their appointments to the king, there was not an attribute of genuine legislative assembly but what they seemed desirous to engross to themselves; and they had been supported in their pretensions by the plaudits of the people, who were sensible that there was no other body in the nation that could plead their cause against royal or ministerial oppression. To suppress, therefore, the only power of controul that remained, and to render the government more arbitrary, was deemed too perilous a measure: yet to leave the parliament in the full possession of their influence, an influence that the minister was convinced would be exerted against him, was at once to render his whole system abortive. In this dilemma, the only expedient was to have recourse to some other assembly, more dignified and solemn in its character, and which should in a greater degree consist of members from the various orders of the state and the different provinces of the kingdom. This promised to be a popular measure; it implied a deference to the people at large, and might be expected to prove highly acceptable. But the true and legitimate assembly of the nation, the States General, had not met since the year 1614; nor

could the minister flatter himself with the obtaining the royal assent to a meeting: despotic sovereign could not but regard with secret jealousy. Another assembly had once been substituted in the room of the States: this was distinguished by the title of the A and consisted of a number of persons from all orders of the kingdom, chiefly selected from the orders of the state, and nominated by himself. This assembly had been convened by Henry IV, again by Lewis XIII, and was once more summoned by the authority of Louis XVI. The writs for calling them together were dated the 29th Dec. 1786; and were addressed to 7 princes of the blood, 9 dukes and 1 prince of France, 8 field marshals, 22 nobles, 8 lords of state, 4 masters of requests, 11 archbishops and bishops, 37 heads of the law, 12 deputies of the *provinces d'états*, the lieutenant civil, and the magistrates of the different towns of the kingdom. The number of members was 144; and on the 1st Jan. 1787, was appointed for the next day the arrival of the Notables at Paris, however the minister found himself yet unprepared to submit his system to their inspection, and postponed the opening of the council to the 7th of Feb. A 2d delay to the 14th, was occasioned by the disposition of M. de Calonne himself, and the count de Vergennes, president of the council of finance and first secretary of state; a delay which was the necessary result of the death of the count de Vergennes on the day previous to that fixed for the opening of the meeting. He was succeeded in the management of foreign affairs by the count de Moustier, a nobleman of unblemished character, whose loss at this critical juncture was severely felt by M. de Calonne; the count alone, of the ministers, having entered with warmth and activity into his plans. The chevalier de Mirabeau, keeper of the seals, was avowedly his rival and enemy. The marshal de Castries, secretary of the marine department, was personally attached to M. Neckar; and the baron de Breteuil, secretary for the household, was the creature of the queen, and deeply engaged in what was called the Austrian system. Under these difficulties M. Calonne, on the 22d Feb. first met the assembly of the Notables, and opened his long expected

(53.) FRANCE, HISTORY OF, UNDER LOUIS XVI, TO THE DISMISSION OF THE NOTABLES. M. de Calonne, began by stating, that the public expenditure had for centuries past exceeded the revenue, and that a very considerable deficit had of course existed; that the Mississippi of 1720 had by no means restored the balance, and that under the economical administration of cardinal Fleury the deficit still existed; that the progress of this derangement under the administration of M. de Maurepas had been extreme; the deficiency amounted to three millions Sterling at the appointment of M. Terray; who, however, reduced it to L. 1,675,000; it decreased a little under the administration that followed, but rose again in consequence of the war, under the administration of M. Neckar; and at his own accession it was L. 3,330,000. To remedy this growing evil M. Calonne recommended a territorial tax like the English land-tax, from which no

men were to be exempted; and an int-
to the poss. of the clergy, which
had been. from contributing
public burden. his branches of
taxation were. to a strict ex-
on; and a con. was pre-
mortgaging the. of the

M. Neckar, previous to. retirement,
filled his *Compte rendu au Peuple*, which
was represented as possessing a clear sur-
plus of 1.500,000. Sterling. This performance had
at with avidity, and probably contributed
from the author the royal favour; but
it was ably vindicated by M. de Bri-
ssot, of Thoulouse. M. de Calonne met
a more formidable adversary in the count
Necker. This extraordinary man, reflect-
ed disposition, licentious in his morals, but
penetrating, and enterprising, had visited
part in Europe. He had been admitted
into the confidence of the minister; and
although in no offensive charac-
ter, at Berlin the disposition of the
of the great Frederick: in this capacity
he was expected to neglect and
his letters were often left unanswered;
he excited to admiration; and he, who had
the Prussian court the intimate friend, re-
to Paris the avowed enemy, of M. de
Necker. While the archbishop therefore arraign-
the minister, the count impeached his
op. The eloquence of M. de Calonne,
might have successfully vindicated his
and reputation against the calculations of
and the invectives of Mirabeau; but he
to support himself against the influence of
great bodies of the nation. The ancient
and clergy had ever been free from all
assessments; and through the shameful
of buying patents of nobility, such crowds
of nobles started up, that every province
was filled with them. The magistracies likewise
of the kingdom enjoyed their share of these
honours; so that the whole weight of the
taxation fell on those who were least able to bear

The minister's design, then, of equalising
the burdens, and, by rendering the taxes
uniform, diminishing the load born by the lower
classes of people, though undoubt-
edly just and patriotic, at once united against
the nobility, the clergy, and the magistracy.
Trigues of these 3 bodies raised against him
a clamour, that finding it impossible to
resist the torrent, he not only resigned his place
on the 12th of April, but soon after retired to
escape from the storm of persecution. During
these dissensions at home, Lewis's attention was
led to the state of affairs in Holland. The
Prince of Orange had been stripped of all autho-
rity by the aristocratic party; and, retiring from
public life, maintained the shadow of a court at
The Hague. His brother-in-law, however, the
King of Prussia, endeavoured to promote his

interest; and having offered, in concert with
France, to undertake the arduous task of com-
posing the differences which distracted the re-
public, the proposal was received with apparent
cordiality by the court of Versailles. But it
could scarce be expected that France would wish
to restore the prince of Orange to that degree of
power which he had before occupied, and thus
abandon one of the most favourite objects of her
policy, the establishing a supreme and permanent
control in the affairs of Holland. In fact, the
conditions framed by the Louvestein faction, as
the basis of reconciliation, were such as plainly
indicated their design to reduce the influence and
authority of the stadtholder within very narrow
limits. But the Prince of Orange was admirably
supported and assisted by the genius, spirit, and
abilities of his consort: who firmly rejected every
measure tending to abridge any rights that had
been attached to the office of stadtholder; and
M. de Rayneval, the French negotiator, having
in vain endeavoured to overcome her resolution,
broke off the correspondence between the Hague
and Nimwegen, and returned to Paris in January
1787. The events that ensued will be found un-
der the article UNITED PROVINCES. It is only
necessary to observe here, that the republican
party were totally disappointed in their hopes
from France. The court of Versailles had indeed
long trusted to the natural strength of the republi-
can party, and had been assiduous during the
whole summer in endeavouring to second them
by every species of succours that could be pri-
vately afforded. These aids, which might have
proved effectual had the contest been confined to
the states of Holland and the stadtholder, were
overwhelmed in the rapid invasion of the Prussians;
for the court of Berlin had taken its measures
with so much celerity, and the situation of the
republicans was already become so desperate,
that it was doubtful whether their affairs could be
restored by any assistance that France was capable
of giving. Yet on great Britain fitting out a
strong squadron of men of war at Portsmouth to
give confidence to the operations of the king of
Prussia, the court of Versailles also sent orders to
equip 16 sail of the line at Brest, and recalled a
small squadron which had been commissioned on
a summer's cruise on the coast of Portugal. But
in these preparations Lewis seemed rather to re-
gard his own dignity, than to be actuated by any
hopes of effectually relieving his allies. All op-
position in Holland might be already considered
as extinguished. The states assembled at the
Hague had officially notified to the court of Ver-
sailles, that the disputes between them and the
stadtholder were now happily terminated; and
as the circumstances which gave occasion for their
application to that court no longer existed, so the
succours which they had then requested would
now be unnecessary. The French court there-
fore readily listened to a memorial from the
British minister at Paris; who proposed, to pre-
serve the good understanding between the two
crowns, that all warlike preparations should be
discontinued, and that the navies of both king-
doms should be again reduced to the footing of a
peace establishment. This was gladly acceded to

by the court of Versailles; and harmony between the two nations was restored. Though Lewis could not but sensibly feel the mortification of thus relinquishing the ascendancy he had attained in the councils of Holland, the state of his own domestic concerns and the internal situation of his kingdom furnished matter for more serious reflection. The dismissal of M. de Calonne had left France without a minister, and almost without a system; and though the king bore the opposition of the Notables with admirable temper, yet the disappointment he had experienced sunk deep into his mind. Without obtaining any relief for his most urgent necessities, he perceived too late that he had opened a path to the restoration of the ancient constitution of France, which had been undermined by the crafty Lewis XI. and had been nearly extinguished by the daring and sanguinary counsels of Richlieu under Lewis XIII. The Notables had indeed demeaned themselves with respect and moderation, but at the same time they had acted with firmness. The appointment of the archbishop of Thoulouze, the vigorous adversary of M. de Calonne, to the office of comptroller general, probably contributed to preserve the appearance of good humour in that assembly; yet the proposed territorial impost, or general land-tax, which was an object so ardently coveted by the court, was rejected. Lewis, therefore, deprived of any further hope of rendering the convention subservient to his embarrassments, determined to dissolve the assembly; which he accordingly did, with a very moderate and conciliatory speech to the members on their dismissal.

(54.) FRANCE, HISTORY OF, UNDER LEWIS XVI, TO THE RECALL OF THE EXILED PARLIAMENT. Thus, disappointed of the advantage which he expected to have drawn from the acquiescence of the Notables, the king was obliged to recur to the usual mode of raising money by royal edicts. Among the measures proposed for this purpose were, the doubling of the poll-tax, the re-establishment of the third twentieth, and a stamp duty. But the whole was strongly disapproved of by the parliament of Paris; and that assembly, in the most positive terms, refused to register the edict. Lewis was obliged to apply, as the last resort, to his absolute authority; and, by holding what was called a *bed of justice*, compelled them to enroll the impost. The parliament, though defeated, were far from being subdued; and on the day after the king had held his bed of justice, they entered a formal protest against the edict; declaring, "that it had been registered against their approbation and consent, by the king's express command; that it neither ought nor should have any force; and that the first person who should presume to attempt to carry it into execution, should be adjudged a traitor, and condemned to the galleys."—This spirited declaration left the king no other alternative, but either to proceed to extremities in support of his authority, or to relinquish for ever the power of raising money without the consent of the parliament. Painful as every appearance of violence must have proved to the mild disposition of Lewis, he could not expect to surrender, without a struggle, that

authority which had been so long exercised by predecessors. Since the commencement of present discontents, the capital had been greatly filled with considerable bodies of troops about a week after the parliament had entered protest, an officer of the French guards, party of soldiers, went at break of day to the house of each member, to signify the king's command, that he should immediately get into his carriage, and proceed to Troyes, a city of Champagne, about 70 miles from Paris, without seeing or speaking to any person out of his house before his departure.—These orders were served at the same instant; and before the members of Paris were acquainted with the transfer of their magistracies, they were already on the road to their place of banishment. Previous to their removal, however, they had presented a remonstrance to the late measures of government, and the present state of public affairs: wherein they declared, that neither the parliaments, nor any other authority, excepting that of the 3 estates of the kingdom collectively assembled, warranted the laying of any permanent tax on the people; and they strongly enforced the renewal of these national assemblies, which had rendered the reign of Charlemagne so great and glorious. This requisition of the parliament to establish the national council, or states general, was the more honourable, as the former assembly must have sunk under the influence of the king, and returned to their original condition of registers and courts of law. The consideration of the people therefore rose in proportion to this instance of disinterestedness; and murmurs were openly expressed in the streets of the capital, and the general dissatisfaction augmented by the step put to public liberty by the exile of the parliament. Lewis, availing himself of rigorous counsels, wished to allay the general discontent by every concession that was consistent with his dignity; but the queen strongly dissuaded him from any step that might diminish the authority of the crown. The influence of that princely cabinet was undoubtedly great: but the popularity which once had accompanied her was now gone; while the count of Artois, the king's brother, who had expelled himself in the most unbecoming terms against the conduct of the parliament, excited the utmost popular hatred. Not only in the capital that the flame once rose; but in the provinces it blazed with equal strength in the provincial parliaments. Among various instances of this, the parliament of Grenoble passed a resolution against LETTRES DE CACHET, one of the most odious engines of arbitrary power. The king had endeavoured to soothe the Parisians by regulations of economy, and by continual attentions in his household: but these efforts, which once would have been received with the loudest acclamations, were now regarded under their affliction for the absence of their parliament. Lewis therefore, to regain the affections, consented to restore that assembly, and gave up the stamp-duty and the territorial

(55.) FRANCE, HISTORY OF, UNDER LEWIS XVI, TO THE RE-ESTABLISHMENT OF THE PARLIAMENT OF NOTABLES. These measures were, in

ment to establish harmony between the court
 e parliament. The necessities of the state
 intained; nor could the deficiency of the
 be supplied but by extraordinary resources.
 the middle of November 1787, in a full
 of the parliament, attended by all the
 of the blood and the peers of France, the
 entered the assembly, and proposed two edicts
 of approbation: one was for a new loan of
 millions, near 19 millions Sterling: the other
 of the re-establishment of the Protestants in all
 ancient civil rights; a measure which had
 been warmly recommended by the parliament.
 his occasion, the king delivered a speech of
 great length, filled with professions of re-
 spect for the people: but strongly expressive of the
 success he expected to his edicts. An animat-
 ed debate took place, and was continued for 9
 days: when the king, chagrined at some free-
 dom in their debates, suddenly rose and
 ordered the edict to be registered without fur-
 delay. This measure was most unexpected-
 ly opposed by the duke of Orleans; who, con-
 sidering it as an infringement of the rights of par-
 liament, protested against the whole proceedings
 of that day as being thereby null and void. Though
 the king could not conceal his astonishment and
 anger at this decisive step, he contented him-
 self with repeating his orders; and immediately
 quitting the assembly, retired to Versailles.
 On the next day, the parliament confirmed the
 edict of the duke of Orleans. It was not to be
 expected that Lewis would suffer so bold an at-
 tack upon his authority with impunity. A letter was sent
 to the duke of Orleans, commanding
 him to retire to Villars Cotterel, one of his
 country seats from Paris, and to receive
 company there except his own family: at the
 same time the Abbé Sabatier and M. Freteau,
 members of the parliament, who had distin-
 guished themselves in the debate, were seized and
 sent, the first to the castle of Mont St Michel
 in Brittany, the last to a prison in Picardy.
 acts of despotism roused the feelings of the
 assembly. On the following day they waited
 on the king, and expressed their astonishment that
 the blood of the blood had been exiled, and two
 members imprisoned, for declaring what
 duty and consciences dictated. The answer
 of the king was reserved, forbidding, and un-
 satisfactory; and tended to increase the resent-
 ment of the parliament. At the same time, it
 did prevent them from attending to the ex-
 ists of the state; and convinced of the emer-
 gency, they consented to register the loan for
 millions of livres, which had been the source
 of his unfortunate difference. This concession
 pleased the king, and the sentence of the two
 knights was in consequence changed from
 imprisonment to exile; M. Freteau being sent to
 his country seat, and the Abbé Sabatier
 to a convent of Benedictines. The parliament,
 however, would not give up the points against
 which they had originally remonstrated. In a
 session touched in the most animated language,
 boldly reprobated the late acts of arbitrary
 power. Lewis naturally mild, and willing to
 pursue measures of reconciliation, in the beginning

of 1788, recalled the duke of Orleans to court,
 who soon after obtained leave to retire to England;
 and he permitted the return of the Abbé Saba-
 tier and M. Freteau to the capital. The parlia-
 ment also seconded the parliament of Grenoble,
 by loudly inveighing against LETTRES DE CACHET.
 These repeated remonstrances, mingled with per-
 sonal reflections, seconded most probably the
 suggestions of the queen, and Lewis was once
 more instigated to measures of severity. Mess.
 d'Espremevil and Monsambert, whose bold and
 pointed harangues had pressed most closely on the
 royal dignity, were doomed to experience its im-
 mediate resentment. While a body of armed
 troops surrounded the hotel in which the parlia-
 ment were convened, Colonel Degout entered
 the assembly, and secured the persons of the ob-
 noxious members, who were instantly conducted
 to different prisons. This new instance of arbi-
 trary violence occasioned a fresh remonstrance from
 parliament, which in boldness far exceeded all
 the former representations of that assembly. They
 declared they were now more strongly confirmed,
 by every proceeding, of the intire innovation
 which was aimed at in the constitution. "But,
 sire," added they, "the French nation will never
 adopt the despotic measures to which you are
 addicted, and which excite alarm the most faithful
 of your magistrates: we shall not support all the
 unfortunate circumstances which afflict us; we
 shall only represent to you with respectful firm-
 ness, that the fundamental laws of the kingdom
 must not be trampled upon, and that your autho-
 rity can only be extended so long as it is tempered
 with justice." Language so pointed and decisive,
 and which asserted the controlling power of the
 laws above the royal authority, could not fail
 fervently to alarm the king; and with a view to
 diminish the influence of parliament, it was deter-
 mined again to convene the Notables.

(36.) FRANCE, HISTORY OF, UNDER LEWIS
 XVI. TO THE RESTORATION OF THE STATES
 GENERAL. Lewis appeared in the assembly of
 the Notables, about the beginning of May, 1788,
 and after complaining of the excesses of the par-
 liament of Paris which had drawn down his re-
 luctant indignation on a few of the members, he
 declared his resolution, to recall them to their
 duty and obedience by a salutary reform. M. de
 la Moignon, as keeper of the seals, then explain-
 ed his majesty's pleasure to establish a *cour pie-
 niere* or supreme assembly, to be composed of princes
 of the blood, peers of the realm, great officers of
 the crown, the clergy, marshals of France,
 governors of provinces, knights of different orders,
 a deputation of one member from every parlia-
 ment, and two members from the chambers of
 council, and to be summoned as often as the public
 emergency, in the royal opinion, should render
 it requisite. If the assembly of the Notables
 listened in silent deference to the project of their
 sovereign, the parliament of Paris received it with
 aversion. That body protested against the esta-
 blishment of any other tribunal; and declared
 their final resolution not to assist at any delibera-
 tions in the supreme assembly which his majesty
 proposed to institute. A more unexpected morti-
 fication occurred to the king in the opposition of
 several

Several peers of the realm : these expressed their regret at beholding the fundamental principles of the constitution violated ; and while they were lavish in their professions of attachment to the person of their sovereign, concluded with apologizing for not entering on those functions assigned them in the plenary court, as being inconsistent with the true interests of his majesty, which were inseparable from those of the nation. The flame quickly spread throughout the more distant provinces ; at Rennes in Brittany, and Grenoble in Dauphine, the people broke out into acts of the most daring outrage ; several hundreds of the inhabitants perished in a conflict with the military ; yet they maintained their ground against the regulars ; and the commanding officer, at the intreaties of the first president, readily withdrew his troops from a contest into which he had entered with reluctance. The different parliaments of the kingdom at the same time expressed their feelings in the most glowing language : and strongly urged the necessity of calling together the states general, the lawful council of the kingdom, as the only means of restoring the public tranquillity. Lewis now plainly saw, that the re-establishment of the *states general* was absolutely necessary, in order to avoid the calamities of a civil war. It was not, however, till after many a painful struggle that he could resolve to restore an assembly, whose influence must naturally diminish that of the crown, and whose jurisdiction would confine within narrow limits the boundless power he had inherited from his predecessors. It is probable that Lewis XVI, still flattered himself with the hope of being able to allure the members of that assembly to the side of the court ; and having employed them to establish some degree of regularity in the finances, and to curb the spirit of the parliaments, that he could again have dismissed them to obscurity. Under these impressions an arrest was issued in August, fixing the meeting of the states general to the 1st of May 1789 ; and every step was taken to secure the favourable opinion of the public during the interval.

(57.) FRANCE, HISTORY OF, UNDER LEWIS XVI, TO THE REVOLUTION, IN 1789. New arrangements now took place in the administration ; and M. Neckar, whom the confidence of the people had long followed, was again introduced into the management of the finances ; the torture, which by a former edict had been restricted in part, was now entirely abolished ; every person accused was allowed the assistance of counsel, and permitted to avail himself of any point of law ; and it was decreed, that in future, sentence of death should not be passed on any person, unless the party accused should be pronounced guilty by a majority at least of 3 judges. The eyes of all Europe were now turned on the states general : but the moment of that assembly's meeting was far from being auspicious : The minds of the French had long been agitated by various rumours ; the unanimity that had been expected from the different orders of the states was extinguished by the jarring pretensions of each ; and their mutual jealousies were attributed by the suspicions of the people to the intrigues of the court, who were supposed already to repent of the hasty assent which had been ex-

torted. A dearth that pervaded the kingdom increased the general discontent ; and the people pressed by hunger, and inflamed by resentment were ripe for revolt. The sovereign also, impatient of the obstacles he daily encountered, could conceal his chagrin ; while the influence of queen in the cabinet was again established, was attended by the immediate removal of Neckar. The dismissal of that minister, so the favourite of the public, was the signal of open insurrection ; the Parisians assembled in thousands ; the guards refused to imbrue their hands in the blood of their fellow citizens ; the court of Artois and the most obnoxious of the nobles thought themselves happy in eluding by flight the fury of the insurgents ; the Bastille, so long deemed impregnable, was attacked, demolished, and its governor beheaded ; and thus on the 14th, 1789, a revolution was accomplished, the most extraordinary of any recorded in history. But the rapid succession of new revolutions, that have taken place in France since that period, and the various forms of government that have been successively established and abolished within these 21 years, having rendered it extremely problematical, whether even the present *aristo-democratic* or *semi-royal* form of government, of the French republic, will prove ultimately more permanent than its predecessors, whatever marks of stability it may seem to possess, we shall postpone our account of the history of France, during its revolutionary state, and of all the astonishing events that have accompanied it, with the great crimes and the great virtues, that have been exhibited in its course to the article REVOLUTION. Long before we arrive at that article, it is to be hoped by every friend of the human race, that a period will be put to the slaughter of Britons, of Frenchmen, and of the allies of both, by a solid and lasting peace founded on the principles of reciprocal justice.

(58.) FRANCE, LATE PROVINCES OF. France before the revolution was divided into the following military governments, or provinces : Alsace, Angoumois, Anjou, Armagnac, Artois, Auvergne, Barrois, Basques, Bearn, Berry, Bretonne, Brissac, Blaisois, Boulonnois, Bourbonnois, Brittany, Burgundy, Cambresis, Champagne, Clermont, Dauphiny, Forez, Foix, Franche Comte, French Flanders, Gascony, Gevaudan, Guienne, French Hainault, Isle of France, Languedoc, Maine, Morvan, Lorrain, Lyonnais, Marche, Maine, Normandy, Navarre, Nivernois, Normandy, Orleans, Perche, Perigord, Picardy, Poitou, Provence, Quercy, Ruoergue, Roussillon, Saintonge, Soissonois, Touraine, Velay, and Vermandois. They varied much from each other in point of extent and importance, and there were others of inferior consideration.

(59.) FRANCE, MODERN DIVISION OF. France was divided by the first legislative assembly into 83 departments, and these were subdivided into districts, cantons, and municipalities. The names of the departments are, Ain, Aisne, Allier, Alpes Lower, Alps Upper, Ardeche, Ardennes, Ariège, Aube, Aude, Aveyron, Calvados, Cantal, Charente Lower, Cher, Correze, Corsica, Creuse, d'Or, Creuse, Dordogne, Doubs, Drome, Eure and Loire, Finisterre, Gard, Garonne Up-

ode, Herault, Indre, Indre and Loire, e and Vilaine, Jura, Landes, Loire, Loire Lower, Loire Upper, Loiret, and Garonne, Lozere, Maine, Maine re, Manche, Marne, Maine Upper, Meuse, Morbihan, Moselle, Mouths of re, Nièvre, Nord or North, North ile, Orne, Paris, Puy de Dome, Pyrene, Pyrenees Lower, Pyrenees Upper, wer, Rhine Upper, Rhone and Loire, per, Saone and Loire, Sarthe, Seine and ne Lower, Seine and Marne, the Two omme, Straits of Calais, Tarn, Var, Vienne, Vienne Upper, Vosges, and About 18 new departments have been ted out of the conquered territories an- the republic. See FRENCH REPUBLIC.

FRANCE, MOUNTAINS OF. The chief s of France, are those of the Alps, Pyren- ences, and Auvergne: Mount Blanc, &c.

FRANCE, NEW CONSTITUTIONS AND GO- IT OF. No country ever had a greater constitutions in so short a period, or a d succession of changes in the form of ment, than France has had within these ars, since the 14th July 1789. The first on formed by the National Assembly, af- urther of the old despotic government, y beautiful limited monarchy: wherein, and hereditary honours were abolished, still retained a considerable degree of ad enjoyed a large annual income; no 1,500,000 l. Sterling being allotted for rsonal expences; a sum evidently one e than is allowed his present Majesty Britain; and nearly double if we deduct ons on the civil list. The next con- which was erected upon the total of monarchy, in August 1792, was a y upon the principles of liberty and e- which was still further amended in May t was never carried into execution. (See acy, § 2.) Instead of this, the most arbitra- oody measures were carried on under the of a junto of the Convention, by their a- he revolutionary tribunals. These were by the mild government, which suc- 1795, under the form of a Directory and ois. Of this constitution we have al- n a pretty full account, under the ar- ouncil, § 8, 9; and DIRECTORY, § 2, he present existing constitution, establish- n, when Bonaparte overturned the Di- nd Councils, and fixed the supreme pow- hands of a triumvirate, under the title of s, a conservatory senate of 24, appointed a tribunate of 100, and a legislative body of eed say little in this place, as it will natural- be considered under the article REVO- . But we cannot conclude this section, observing, that, tho' France still retains e of a republic, and its public acts are in- with the words LIBERTY and EQUALITY, resent constitution retains very little of the e of either; as the successive controul of rent classes of voters, arranged by it in ion to their property, over the preceding

voters possessed of less property, reduces any ef- fect of the first suffrages given by the citizens as large, to a mere shadow; and the 41st article of the Constitution gives to the First Consul a degree of power almost despotic, and greatly superior to that enjoyed by the unfortunate Lewis XVI, under the beautiful limited monarchy established by the Constitution of 1789—91.

(62.) **FRANCE, POPULATION OF.** The popula- tion of France, before the revolution, was stated by the French at 25 millions; but from the great ex- tent of territory added to the republic since the commencement of the present war, and now in- corporated with it, (see FRENCH REPUBLIC,) the total population is supposed to be now increased to at least 33 millions.

(63.) **FRANCE, PRESENT EXTENT OF.** See FRENCH REPUBLIC.

(64.) **FRANCE, PRODUCTIONS OF.** Besides all the necessaries of life, (see § 2.) France produces many of its luxuries; as silk, perfumes, lemons, o- ranges, olives, prunes, peaches, &c. The forests a- bound with wood, and the mountains with mines of copper, lead, tin, iron; and some gold and silver. Gold in grains is also found among the sands of some rivers.

(65.) **FRANCE, RELIGION OF.** The established religion of France, from the reign of Clovis I. to the revolution, has been the Roman Catholic; and though it was never accompanied by that dreadful engine of ecclesiastical tyranny, the inquisition, yet no country in Europe has exhibited more barba- rous and bloody proofs of the intolerant spirit of that system of superstition than France. (See § 41.) Yet, though universal liberty of conscience was es- tablished upon the revolution in 1789, the Roman Catholic system was not attempted to be abolish- ed. So far from this, the kingdom was divided in- to 10 archbishoprics (formerly 19), and 73 bishop- rics (formerly 113), an episcopal hierarchy; an e- piscopal town being allotted to each department. But Danton and his atheistical associates, in the Convention of 1793, endeavoured to overthrow all religion whatsoever. Upon the fall of Danton, Robertspierre, affecting an abhorrence of the im- piety of ATHEISM, did his utmost to recommend DEISM, in its stead. But since his death, CHRIS- TIANITY has been again openly professed; the churches have been restored to the use of all who in- eline to attend them; and people of all religious persuasions are allowed to worship God in the way most agreeable to themselves; only as no particu- lar system is established, no salaries are paid to the priests at the public expence, but each party pays its own clergy.

(66.) **FRANCE, RIVERS OF.** France is watered and fertilized by a great number of rivers, many of which afford names to the new departments. (See § 59.) The principal of these are the Seine, Loire, Garonne, and Rhone.

(67.) **FRANCE, SOIL OF.** See § 2.

(68.) **FRANCE, STRENGTH OF.** The present strength of the French republic, we shall not attempt to estimate. It has been sufficiently tried during the course of the present war, and will probably be still more so before it be concluded. Previous to the revolution, the army, in time of peace,

consisted of 200,000 men, and, in time of war, of 400,000; among whom were many Swiss, Germans, Scots, Irish, Swedes, and Danes.

(69.) FRANCE, TAXES AND CI-DEVANT REVENUES OF. See § 3.

(70.) FRANCE, TRADE AND MANUFACTURES OF. The French in time of peace carry on a great trade with Spain, Italy, and the E. Indies. Before the war, a trade very advantageous to Britain was established by the Commercial Treaty. They have very extensive manufactures of linens, woollens, silks, laces, paper, china, soap, &c. and particularly what is called *Castile* soap.

(71.) FRANCE, TOWNS, CITIES, AND VILLAGES IN. France before the war, was said to contain 400 cities or walled towns, and 43,000 small towns and villages. Paris is the capital.

(II.) FRANCE, ISLE OF, a ci-devant province of France, so called, because it was formerly bounded by the rivers Seine, Marne, Oise, Aisne, and Ourque. It comprehended the Beauvoisis, the Valois, the county of Senlis, the Vexin, the Hurepois, the Gatinois, the Multien, the Goele, and the Mantois. Paris was the capital. It is now divided into 4 departments; viz. Oise, Seine and Oise, Seine and Marne, and Paris.

(III.) FRANCE, ISLE OF, or MAURITIUS, an island in the Indian Ocean. See MAURITIUS.

(IV.) FRANCE, LITTLE, a village of Scotland, 2 miles SE. of Edinburgh, near CRAIGMILLAR Castle; built in the 16th century, for the accommodation of the French retinue, that attended Queen Mary after her return from Paris.

FRANCESCA, Peter, an eminent Florentine painter of night pieces and battles, who was employed to paint the Vatican. He also painted portraits, and wrote on arithmetic and geometry. He died in 1458.

(1.) FRANCFORT ON THE MAINE, an Imperial and Hanseatic town of Germany, in Franconia, where the emperors were formerly elected. It is a handsome, strong, and rich place, and has a great deal of commerce. Here the golden bull is preserved, which is the original of the fundamental laws of the empire. The town is seated in a fine fertile plain; and extremely well fortified. It has 2 great fairs, and has great conveniency for carrying on an extensive trade with the other parts of Germany, by the Maine, which runs through it. The suburbs are called SAXEN-HAUSEN, and are joined to the town by a stone bridge over the Maine. Lutheranism is the established faith, but the Calvinists are richest and most numerous. It is 20 miles E. of Mentz, and 350 W. by N. of Vienna. It was taken by the French in Oct. 1792, by the Prussians in Dec. retaken by the French, in 1793, and afterwards by the Austrians. It is at present, (July 1806,) blockaded by the French, under gen. St. Suzanne. Lon. 8. 40. E. Lat. 49. 55. N.

(2.) FRANCFORT ON THE ODER, a rich and handsome town of Germany, in the middle Marche of Brandenburg, formerly imperial, but now subject to the king of Prussia. It has 3 great fairs, an academy and 2 colleges; and is 43 miles SE. of Berlin, and 72 S. of Stettin. Lon. 14. 39. E. Lat. 52. 23. N.

FRANCHIE Compta, a ci-devant province of France, bounded on the S. by Breffe; on the W.

by Burgundy; on the N. by Lorrain; and E. by Alsace and Switzerland. It is 1 long from N. to S. and 80 broad. It is p and partly hilly. The flat country is fr grain, wine, hemp, and pasture; and th bound in cattle, copper, lead, iron, silver, waters, stone, marble, and alabaster. It divided into 3 departments; viz. Doubs and Upper Saone.

FRANCHEMONT, or } a town and
FRANCHIMONT, } a ci-devant
sate, of Germany, in the late bishopric o now included in the French republic, and ment of Ourte. The town lies 13 mile Liege.

FRANCHIRE, a river of Madagascar province of Anossi.

FRANCHIS, a town NW. of Burwash

(1.) * FRANCHISE. *n. f.* [*franchise*, Fr exemption from any onerous duty. 2. P immunity; right granted.—They grant markets, and other *franchises*, and erect rate towns among them. *Davies on Irela.*

His gracious edict the same *franchise*
To all the wild increase of woods and

3. District; extent of jurisdiction.—The ther privileges granted unto most of the tions, that they shall not be travelled forth own *franchises*. *Spenser's Ireland.*

(2.) FRANCHISE and LIBERTY, in law, as synonymous terms; for “a royal priv branch of the king's prerogative, subsist hands of a subject.” Being therefore deri the crown, they must arise from the king or, in some cases, may be held by pre which presupposes a grant. The kinds a rous and various. We shall briefly ment of the principal; premising only, that t be vested either in natural persons or bo tic; in one man, or in many: but the sa tical franchise, that has before been gr one, cannot be bestowed on another, would prejudice the former grant. A PALATINE is a franchise vested in several It is likewise a franchise for a number of to be incorporated and subsist as a body with a power to maintain perpetual ti and do other corporate acts: and each i member of such corporation is also said i franchise. Other franchises are, to hold lect; to have a manor or lordship; or, to have a lordship paramount: to ha wrecks, estrays, treasure-trove, royal feitures, and deadlands: to have a court own, or liberty of holding pleas and tryin to have cognizance of pleas; which is a l liberty, being an exclusive right, so that court shall try causes arising within that tion: to have a bailiwick, or liberty exer the sheriff of the county; wherein the gr ly, and his officers, are to execute all p to have a fair or market; with the right toll, either there or at any other public at bridges, wharfs, or the like; which t have a reasonable cause of commencing consideration of repairs, or the like, t else chite is illegal and void: or lastly, to hav

ark, warren, or fishery, endowed with pri-royalty. See CHASE, FOREST, &c.

ANCHISE is also used for an asylum or, where people are secure of their per-

Churches and monasteries in Spain are for criminals; so were they anciently in till they were abused to such a degree was a necessity for abolishing the cus- of the most remarkable capitulars made magne in his palace of Heristal, in 779, relating to the franchises of churches. of franchise was held so sacred, that its religious kings observed it to a degree outcasts; but to such excess in time was, that Charlemagne resolved to reduce it. ly he forbid any provision to be carried as retired into churches for refuge.

FRANCHISE OF QUARTERS is a certain district at Rome, wherein are the houses habitations of the princes of Europe; and when they retire cannot be arrested or seized, except at law. The people of Rome look on it as an old usurpation and a scandalous privilege of ambassadors, out of a jealousy of the pope, carried to a great length in the 15th century by enlarging infinitely the dependencies of the houses, within which the right of sanctuary was anciently confined. Popes Julius III, Gregory XIII, and Sixtus V, published laws and ordinances against this abuse; and reduced so considerable a part of the pope's authority, and rendered it a refuge for the most abandoned persons. At length Pope Alexander VI. expressly refused to receive any more ambassadors, but such as would make a formal renunciation of the franchise of quarters.

FRANCHISE, *v. a.* (from the noun.) To make free; to make free; to keep free.—

I lose no honour
in going to augment it; but still keep
my *franchis'd*, and allegiance clear.

Shack. Macbeth.

FRANCIA, Francis, a celebrated Bolognese painter, born in 1470. He was first a jeweller, and a maker of coins and medals; and applied to painting, obtained great reputation for his works, particularly by a piece of St Francis, in which he had drawn bound to a tree, and his hands tied over his head. He pined himself to death by despising to equal his rivals, and died in 1518.

FRANCIA, a town of Naples, in the province of Ultra; 8 miles NE. of Nicotera.

FRANCIADE, or ST DENYS. See DENYS, N^o 5.

FRANCIS I. and II, kings of France. See FRANCIS, N^o 39, 40.

FRANCIS, Philip, D. D. a very ingenious scholar of Irish extraction, if not born in Ireland. He was first dean of a cathedral in that kingdom, and then retired to the church. He was more esteemed as a translator than as an original author. His versions of Horace and Demosthenes are justly valued; the former is accompanied with learned and useful notes. He was also a considerable political writer; and is supposed to have been employed by the government; for which he was appointed rector of Barrow in Suffolk. Part I.

folk, and chaplain of Chelsea hospital. He was also the author of two tragedies, *Eugenia*, and *Constantia*. He died at Bath in March 1773; leaving a son, then one of the supreme council at Bengal.

(4.) FRANCIS, ST, the founder of the society of the FRANCISCANS, was the son of a merchant of Assisi, in the province of Umbria. Having led a dissolute life, he was reclaimed by a fit of sickness, and afterwards fell into an extravagant kind of devotion, that looked less like religion than alienation of mind. In 1208, hearing the passage quoted, (Matt. x. 9, 10.) "Provide neither gold, nor silver," &c. he was led to consider a voluntary and absolute poverty as the essence of the gospel, and to prescribe it as a sacred rule to himself and those who followed him. See FRANCISCANS. He died in 1226.

FRANCISCANS, in ecclesiastical history, religious of the order of ST FRANCIS, founded by him in 1209. This society, which appeared to Innocent III. extremely adapted to the state of the church, was solemnly approved and confirmed by Honorius III. in 1223. Francis, through an excessive humility, would not suffer the monks of his order to be called *fratres*, i. e. brethren or friars, but FRATERCULI, i. e. little brethren, or *fratres minor*, by which denomination they still continue to be distinguished. They are also called *grey friars*, on account of the colour of their clothing, and CORDELIERS, &c. The Franciscans and DOMINICANS were zealous and active friends to the papal hierarchy. In 1287, Matthew of Aqua Sparta, being elected general of the order, discouraged the ancient discipline of the Franciscans, and indulged his monks in abandoning even the appearance of poverty. This conduct raised the indignation of the spiritual or austere Franciscans; so that from 1290, schisms arose in the order that had been famous for its pretended disinterestedness and humility. Such was the enthusiastic frenzy of the Franciscans, that they impudently maintained, that St Francis was a *second Christ*, in all respects similar to the first; and that their institution and discipline were the true gospel of Jesus. Accordingly, Albizzi, a Franciscan of Pisa, published a book in 1383, with the applause of his order, intitled, *The Book of the Conformities of St Francis with Jesus Christ*. In the beginning of the 18th century, the whole Franciscan order was divided into two parties; the one called *Spirituals*, who embraced the severe discipline and absolute poverty of St Francis; and the other, *Brothers of the Community*, who insisted on mitigating the austere injunctions of their founder. These wore long, loose, and good habits, with large hoods; the former were clad in a strait, coarse, and short dress, pretending that this dress was enjoined by St Francis, and that no power on earth had a right to alter it. Neither the moderation of Clement V, nor the violence of John XXII, could appease the tumult occasioned by these two parties: however their rage subsided from A. D. 1329. In 1368 these two parties were formed into two large bodies, which still subsist, comprehending the whole Franciscan order; viz. the *conventual brethren*, and the *brothers of the observance* or *reformation*, from whom sprung the Capuchins and Recollects. The Franciscans are said to have con-

into England in 1224, and to have had their first house at Canterbury, and their second at London; but there is no certain account of their being here till Henry VII. built 2 or 3 houses for them. At the dissolution of the monasteries, the conventual Franciscans had about 55 houses, which were under 7 wardenships; viz. those of London, York, Cambridge, Bristol, Oxford, Newcastle, and Worcester.

FRANCKEMONT. See FRANCHMONT.

FRANCKENBERG, a town of Germany, in the circle of the Upper Rhine, and principality of Hesse; 16 m. N. of Marburg, and 29 SW. of Cassel.

FRANCKENMARK, or FRANKEMARK, a town of Germany, in Aultria; 8 m. SW. of Voglabruck.

FRANCKS, a town of Kent, E. of the Crays.

FRANCOCCI, a town of Italy, in the duchy of Spoleto, 7 miles WNW. of Spoleto.

FRANCOIS, CAPE, a town in the N. part of Hispaniola. It suffered much from the dreadful commotions that took place in that island, in 1794, 95, and 96. Lon. 72. 18. W. Lat. 19. 46. N.

FRANCOISE, a town of France, in the dept. of Lot, 7½ miles NW. of Montauban, and 20½ SSW. of Cahors. Lon. 18. 54. E. of Ferro. Lat. 44. 7. N.

FRANGOLIN. See ATTAGEN.

FRANCONIA, a circle of Germany, bounded on the N. by Meissen and Thuringia, on the S. by Bavaria and Suabia; on the E. by Bohemia and the Upper Palatinate, and on the W. by the Lower, and the electorate of Mentz; being 88 miles from N. to S. and 95 from E. to W. The middle is very fertile in corn, wine, and fruits; but the borders are full of woods and barren mountains. The majority of the people are Lutherans; but there are also many Calvinists, Roman Catholics, and Jews. The FRANKS, who conquered and gave name to France, came from this province. See FRANCE, § 4. Nuremberg is the capital.

FRANCONVILLE, a town of France, 10 miles N. of Paris.

FRANCOSO, a town of Portugal, in the province of Beira, 22 miles E. of Viseu.

FRANCOVILLA, a town of the Ligurian republic, 6 miles S. of Novi.

FRANCREMONT, a town of the French republic, in the dep. of Ourte, and late bishopric of Liege. 4 miles N. of Spa.

4. Not restrained; licentious. Not in
Might not be found a *franker* fr

(II.) FRANK, or FRANC, in the ancie
customs, signifies literally *free* from c
impositions, or exempt from public tax
in various senses: sometimes compou
sometimes not; though the latter is dou
proper. Thus,

1. * FRANKALMOIGNE. *n. f.* The f
we in Latin call *libera elemosyna*, or f
English; whence that tenure is commo
among our English lawyers by the nar
nure in *frank aumone*, or *frankalmoig*
according to Briton, is a tenure by di
Ayliffe's Parergon.

2. FRANK ALMOIGNE is a tenure,
religious corporation, aggregate or sol
lands of the donor to them and their
for ever. The service which they were
render for these lands was not defined
in general to pray for the souls of the
his heirs, dead or alive; and therefore t
fealty (which was incident to all other
because this *divine service* was of a m
nature. This is the tenure by which al
ancient monasteries and religious houses
lands; and by which the parochial c
very many ecclesiastical and eleemosyna
tions, still hold them; the nature of
being upon the reformation altered,
conformable to the purer doctrines of
of England. It was an old Saxon te
continued under the Norman revolutio
the great respect that was shown to r
religious men in ancient times. This
reason that tenants in frankalmoigne we
ged of all other services except the *trin*
tas, of repairing the highways, buildi

pulling invasions; just as the druids, among ancient Britons, had *omnium rerum immunitas*. And even at present this is a tenure of a different nature from all others; being not in itself feudal, but merely spiritual. For, if the lord be neglected, the law gives no remedy by writ, or otherwise, to the lord of whom the tenant is holden; but merely a complaint to the king or visitor to correct it.

FRANK CHACE is a liberty of free chace, by persons that have lands within the county of the same, are prohibited to cut down any wood out of the view of the forester.

FRANK FEE signifies the same thing as hold-land and tenements in fee simple; that is, to the tenant and his heirs, and not by such service as is required by ancient demesne, but is pleaded in common law. See **FEE**.

FRANK LAW, the free and common law of the land, or the benefit a person has by it. He who by offence loseth this frank law incurs many inconveniences, viz. He may not be permitted to serve on juries, nor used as an evidence in law; and if he has any thing to do in the court, he must not approach it in person, but by his attorney; his lands, goods, and chattels be seized into the king's hands; and he be estranged, his trees rooted up, and he committed to custody.

FRANK MARRIAGE, in law, is where tenements are given by one man to another, together with his wife, who is the daughter or cousin to the donor, to hold in frank marriage. By such gift, having but *frank marriage* is expressed, the wife shall have the tenements to them, and the issue of their two bodies begotten; that is, in special tail. For this expression, *frank marriage*, denotes, *ex vi termini*, not by purchase, like *frank almoigne*, but like inheritance; supplying, not only the issue of the donor, but of procreation also. Such marriages in frank marriage are liable to no service; for a rent reserved therein is void unless the degree of consanguinity be past between the issue of the donor and donee.

FRANKPLEDGE. *n. s.* [*franciplegium*, Lat. *n. l. e. liber & pleige*. *i. e. fidei iussor*.] A surety or surety for freemen. For the ancient custom of England, for the preservation of the public peace, was that every freeborn man at 14 years of age, religious persons, clerks, knights and ~~other~~ *other* sons excepted, should find security for his life to the king, or else be kept in prison: and it became customary for a certain number of freemen to be bound for one another, to see that the pledge forthcoming at all times, in case of the transgression of any one absent himself. This was called *frankpledge*, and the sum of the pledge was called *decenna*, because it consisted of ten households; and every part of the person, thus mutually bound, was called *frank*. This custom was so strictly observed, that the sheriffs, in every county, did from time to time take the oaths of young ones as they grew up, of fourteen years, and see that they were bound in one dozen or other: this branch of the king's authority was called *visus franciplegii*, or *frankpledge*. *Cocuel*.

8. FRANK PLEDGE.—In such cases, as those above-mentioned, (§ 7.) whenever any person offended, the persons bound either produced the offender in 31 days, or made satisfaction for his offence.

9. FRANK TENEMENT. See **TENURE**.

(III. l.) * **FRANK**. *n. s.* [from the adjective.]

1. A place to feed hogs in; a sty: so called from liberality of food.—Where lups he? Doth the old boar feed in the old *frank*? *Shakspeare*. *Henry IV.*

2. A letter which pays no postage.—You'll have immediately, by several *franks*, my epistle to lord Cobham. *Pope*. 3. A French coin.

(ii.) **FRANK**, § III, i; *def.* 2. See **FRANKED LETTERS**.

(iii.) *The* **FRANK**, or **FRANC**, (§ III, i; *def.* 3.) anciently current in France, was either of gold or silver:

1. **FRANK, GOLD**, was something more than that of the gold crown.

2. **FRANK, SILVER**, was a third of the value of the gold one. This coin has been long out of use, though the term is still retained as the name of a money of account; in which sense it is equivalent to the livre, or 20 sols.

(IV.) **FRANK**, in geography, a town of the United States, in S. Carolina, 11 m. E. of Kingston.

(V.) **FRANK LANGUAGE**, *Lingua Franca*, a kind of jargon spoken on the Mediterranean, and particularly throughout the coasts and ports of the Levant, composed of Italian, Spanish, French, vulgar Greek, and other languages.

* *To* **FRANK**. *v. a.* [from the noun.] 1. To shut up in a frank or sty. *Hanmer*.—

In the sty of this most bloody boar,

My son George Stanly is *frank'd* up in hold.

Shakspeare.

2. To feed high; to fat; to cram. *Junius* and *Ainsworth*. 3. [From the adjective.] To exempt letters from postage.—My lord Orrery writes to you to-morrow; and you see I send this under his cover, or at least *franked* by him. *Swift*.—

Gazettes sent gratis down, and *frank'd*,

For which thy patron's weekly thank'd. *Pope*.

FRANKED LETTERS. The privilege of letters coming free of postage to and from members of parliament was claimed by the House of Commons in 1660, when the first legal settlement of the present post-office was made; but afterwards dropped, upon a private assurance from the crown, that this privilege should be allowed the members. Accordingly a warrant was constantly issued to the postmaster general, directing the allowance thereof to the extent of two ounces in weight: till at length it was expressly confirmed by 4 Geo. III. c. 24. which added many new regulations, rendered necessary by the great abuses in franking; whereby the annual amount of franked letters had increased from 23,600*l.* in the year 1715, to 170,700*l.* in the year 1763. Other regulations afterwards took place; in particular, franks were required to be dated (the month written at length), and put into the office the same day; notwithstanding which, the revenue still lost by this privilege above 80,000*l.* *per annum*. The following are the regulations of franking required by 35 Geo. III. and now in force. No letter directed by or to any M. P. shall be exempted from postage if it

exceeds 1 oz. in weight. No letter directed by any member shall be exempted, unless he shall actually be in the post town, or within the limits of its delivery of letters, or within 20 miles of it on the day, or the day before it, on which the letter shall be put into the office. No member shall be entitled to send free from postage more than ten letters in one day, nor to receive more than 15. Whenever the number of letters sent or received by such member in one day shall exceed the number exempted, and the postage upon any of them shall differ, the letters chargeable with a higher postage shall be included in the number exempted, in preference to any chargeable with a lower postage, and the remainder shall be chargeable with the postage to which common letters are now chargeable. Persons who may now in right of their offices send and receive letters free may continue so to do. Printed votes or proceedings in parliament, and printed newspapers may also be sent as usual. No single letter sent by the post from any non-commissioned officer, seaman, or private, in the navy, army, militia, fencible regiments, artillery, or marines, shall be charged with more postage than one penny, but must be paid at the time of putting it into the post office; and such letter must have written thereon, in the hand writing of and signed by the commanding officer, the name of such commanding officer, and of the ship, vessel, corps, regiment, or detachment. Also no single letter directed to any such non-commissioned officer, seaman, or private, shall be charged with more postage than one penny, to be paid on the delivery thereof; but such letter must be directed to such persons, specifying the ship, vessel, regiment, troop, corps, company, or detachment to which they belong: And the postmaster must deliver such letter either to the party to whom it shall be directed, or to some person appointed to receive the same by the commanding officer, and to no other. Every cover containing patterns or samples of goods, not exceeding one ounce, shall be charged only as a single letter, if sent open at the sides, and without any letter or writing therewith, other than the name of the person sending the same, the place of his abode, and the prices of the articles.

(1.) **FRANKLIN**, Francis, commonly called *Old Frank*, a famous Flemish painter, supposed to have been born about A. D. 1544. He painted historical subjects from the Old and New Testament; and was remarkable for introducing a great number of figures into his compositions, which he set the address to express very distinctly. Vandyck greatly commended his works.

(2.) **FRANKLIN**, James, or *James Frank*, the son of the former, born in 1570, was distinguished by his father's whole style he adopted so closely, that their works are not easily distinguished. He travelled into Italy for improvement in colouring. His chief performances are, a large oval piece in the church of Notre dame at Antwerp; and another, of Solomon's idolatry. He died in 1642.

FRANKENAU, a town of Germany, in the circle of the Upper Rhine, and principality of Hesse, 24 miles SW. of Cassel, and 32 SSW. of Waldeck.

(1.) **FRANKENBERG**, a town of Germany, Austria; 6 miles WNW. of Voislanow.

(2.) **FRANKENBERG**, a town of Upper Erzgebürg, 9 miles W. of Freyberg NNE. of Chemnitz.

(3.) **FRANKENBERG**. See **FRANKENFRANKENDAL**, a strong town of lately in the dominions of the Elector now included in the French republic, of Mont Tonnerre. It was taken by the in 1623, by the Swedes in 1632, and the French in 1688. It was taken by the and laid under contribution in 1793, by the Austrians, and finally taken by the Oct. 1794, and annexed to the republic. It has a good trade in porcelain, cloth, silks, and a navigable canal to the Rhine. It is NW. of Mannheim, and 8 S. of Worms 29. E. Lat. 49. 25. N.

FRANKENFELS, a town of Austria, Norderbach, 20 miles WSW. of Hainau.

FRANKENHAUSEN, two towns in Saxony; 1. in Erzgebürg, 8 miles N. of Zwickau; 2. in Schwartzburg-Rudolstadt, on the Wipper. It has rich salt-works. E. of Sonderhausen, and 26 N. of Erfurt 28. 43. E. of Ferro. Lat. 51. 16. N.

FRANKENIA, in botany, a genus in the monogynia order, belonging to the hexandria of plants; and in the natural method under the 17th order, *Calycanthaceae*. The fruit is quinquefid, and funnel shaped; the petals five, the stigma sexpartite; the capsule unilocular.

(1.) **FRANKENSTEIN**, a town of Germany, in the circle of the Upper Rhine; 5 miles N. of Darnstadt.

(2.) **FRANKENSTEIN**, a town of Silesia, Bautzen, 9 miles W. of Mitterberg.

(3.) **FRANKENSTEIN**, a town of the public, in the department of Sarre and ci-devant duchy of Deux-Ponts; 22 miles of Deux-Ponts, and 22 NW. of Landau 55. E. Lat. 49. 18. N.

(1.) **FRANKFORD**, a town of Virginia, capital of Pendleton county, situated on a branch of the Potomac; 185 miles NW. of Richmond, and 350 WSW. of Philadelphia 31. W. of that city. Lat. 38. 45. N.

(2.) **FRANKFORD**, a village of Virginia, in Albemarle county, situated on Patterson's Creek NW. of Romney.

(1.) **FRANKFORT**, a town of the United States, on the river and in the state of Kentucky 25. 12. W. Lat. 36. 3. N.

(2, 3.) **FRANKFORT**. See **FRANKFORT**.

(1.) **FRANKINCENSE**, a resinous substance so called perhaps from its liberal distribution. *Frankincense* is a dry retort in pieces or drops, of a pale yellowish white, with a strong smell, but not disagreeable, and a sweet and resinous taste. It is very ancient. The earliest histories inform us, that it was used among the sacred rites and in medicine. It continues to be in many parts. We are uncertain as to the place whence it is brought, and as to the tree which produces it. *Hill*.—Take unto thee sweet spices, *Frankincense*. *Exodus*.—I find in *Dioscorides*

frankincense gotten in India. *Brerewood on*
igs.—

South Sea; 6 miles from the NE. coast of
Island. Lon. 146. 0. E. Lat. 17. 13. S.

FRANKLIN, Benjamin, LL. D. and F. R.
of the most celebrated philosophers and
of the 18th century, was born at Boston,
1706. He was the son of Josias Franklin, a
chandler, descended from an ancient Eng-
lish, who had resided upwards of three cen-
turies in Northamptonshire, possessing
a freehold estate of 30 acres, and the eldest
heretofore had been uniformly bred up to the
trade of a blacksmith. This family had early
embraced the opinions of the reformation, and
was in danger of suffering for them, under the
pressure of Q. Mary I. Benjamin was the
eldest son of the youngest branch of this family.
After having joined the non-conformists, and
the prohibition of conventicles under Charles
II. he emigrated with his wife and family, to New
England in 1682; where, on the death of his first
wife, he married Abiah Folger, daughter of Peter
Folger, author of several tracts on liberty of con-
science, who bore him 9 children besides our
author. Benjamin early acquired reading and
writing, but made no progress in Arithmetic, as
appears in his memoirs written by himself.
At 15 to 16 years of age he wrought at his
father's trade, but his inclination for books
induced his father to make him a printer,
where his elder brother James was already of
profession. To this brother he was ac-
cordingly bound apprentice, and by his rapid
progress in the business soon became of great
service, though he often treated him rather
severely. Mean time he improved himself
in Latin and other branches of science, as well
as composition, by writing anonymous essays
for another's paper, *The New England Courant*,
which, being much admired, were for some
time a great advantage to it. But one of them, upon
a political subject, happening to give offence to
the Assembly, his brother was taken up, imprison-
ed a month, and prohibited from printing his
paper. The paper was then continued under
the name of *Benjamin Franklin*, whose indentures
were discharged, and a new secret contract agreed
to: but fresh differences afterwards arising
between the brothers, our author, at the age
of 17, emigrated to Philadelphia, where he ar-
rived without knowing a single individual in it,
escaping the danger of being taken up as a
way servant, and various other droll ad-
ventures, which he humourously describes in his
memoirs. Here he soon got employment from
Gordon and Keimer, the two only printers then
in the city. After this he was introduced by his
cousin-law, Captain Holmes, to Sir William

Keith, governor of the Province, who *promised* to
do much for him, but, except entertaining him
occasionally, in his own house or a tavern, per-
formed nothing. By his advice, however, he
paid a visit to his parents, and in the end of 1724,
sailed for London, where by his own merit, with-
out Sir William's promised letters of recommen-
dation and credit, he obtained the best employ-
ment, first in Palmer's printing office, and after-
wards in Watt's. At this time our author falling
in with some Deistical companions, renounced
the religious principles in which he had been edu-
cated, commenced Sceptic, and published a
Dissertation on Liberty and Necessity, Pleasure and
Pain, wherein he endeavoured to prove that there
is no difference between virtue and vice; which
he afterwards considered as one of the grand er-
rors of his life. This work, however, introduced
him to the acquaintance of Dr Mandeville, Dr
Pemberton, Sir Hans Sloane, and other celebra-
ted authors. He had been only 18 months, how-
ever, in London, during which time, living very
temperately, or rather abstemiously, he had begun
to lay up money, when a proposal was made to
him by his friend, Mr Denham, of returning to
Philadelphia. This gentleman had been formerly
a merchant in Bristol, and, having failed, emigrat-
ed to America, where he made a fortune; then
returned, invited his creditors to a feast, and paid
their balances with interest. He engaged Franklin
as his clerk and book-keeper, and to superintend
the goods he was carrying back to America. They
accordingly sailed on the 23d July, 1726, and ar-
rived at Philadelphia, Oct. 11. but Denham dying
in Feb. 1727, our author engaged once more as
a printer with Keimer; whom he also served as a
letter-founder, ink-maker, engraver, and copper-
plate printer; as well as constructor of a press for
that purpose. This press which was the first that
had been seen in the country, was erected by Mr
Franklin at Burlington, to print some New Jersey
money bills; and proved the means of his ac-
quaintance with Judge Allen, and several other
members of the assembly, who were afterwards
of great service to him. After this he com-
missioned types from London, set up a printing
office, in company with Hugh Meredith, one of
Keimer's lads; and, at the same time established
a weekly club, for mutual improvement, which
not only proved an excellent school of philosophy
and politics, but turned out also very beneficial
to his business. This Society, which was called
the *Junto*, lasted near 40 years. Mean time he
astonished the public by his personal industry.
Early and late at work, he composed and distri-
buted a sheet per day of a work in folio, on pic-
ture letter loaded with heavy notes in a smaller type,
besides doing other occasional jobs as they came
in. This indefatigable industry soon raised his
credit, and Keimer, being unable to continue his
News-paper, sold the copy-right to Franklin for
a mere trifle; who by his improvements in the
conduct and execution of it, soon raised it to such
a degree of celebrity, as to make his fortune by
it. After this his accurate and elegant manner of
printing recommended him to the employment of
the Assembly: And his partner Meredith being
unable to raise his share of the money to pay for
the

the printing materials, gave up the printing, turned farmer, and thus left Franklin sole proprietor of the business, in 1729. Whereupon his friends Mess. Coleman and Grace offered him money to carry it on extensively, and he accepted of half the offered sum from each. Soon after a new emission of Paper currency being wished for by the public, but opposed by the opulent part of the Assembly, Franklin published a pamphlet on the subject, which, being unanswerable, occasioned the measure to be carried through, and himself to be rewarded by being employed to print the bills. Public and private employment now flowing upon him more and more, he, in 1736, married a lady, for whom he had entertained an affection before he went to London, and whose attachment was mutual. This lady was not *his partner's daughter*, as the Editors of both the *Encyclopædia Britannica* and the *English Encyclopædia* affirm; but a young widow, whose maiden name was Read, and who, during his absence had been prevailed on by her mother, to marry one Rogers, a potter, who had used her so ill, that she did not so much as bear his name. (See *Franklin's Life*, written by himself, and published by Dr R. Price.) To our author she proved an excellent wife, and contributed much to the success of his Stationary shop. In 1731, Franklin's love of literature led him to set on foot, first a private, and afterwards a public library, which, in 1742, was incorporated by the name of *The Library Company of Philadelphia*; which now consists of many thousand volumes, besides a philosophical apparatus, &c. In 1732, he began to publish *Poor Richard's Almanack*, a work which he rendered remarkable by its numerous valuable and concise moral maxims, recommending industry and œconomy, and which he at last collected into one humorous address to the reader, entitled *The Way to Wealth*, which has since been translated into various languages. In 1736, he entered on his political career, by being appointed Clerk to the General Assembly of Pennsylvania. In 1737, he was appointed Postmaster. In 1738, he formed the first Company for preventing damages by fires, and soon after got an insurance office erected. In 1744, during the war between France and Britain, the French and Indians having made inroads upon the frontiers of the province, he proposed a voluntary association for its defence; which was approved of, and immediately signed by 1200 citizens, who chose Franklin their colonel. But he was then too deeply engaged in philosophical and political pursuits to accept of that honour. In 1745, he published an account of his new invented fire-place. See FIRE-PLACE, § 2. In 1747, he was elected a member of the General Assembly, where he supported the rights of the citizens in opposition to the proprietaries. In 1749, he completed the plan of the Philadelphia Academy, upon the most liberal principles, which was incorporated in 1753. Franklin had now conducted himself so well in his office of postmaster to the province, that in 1753, he was appointed deputy post-master general for the British Colonies; and in his hands this branch of the revenue soon yielded thrice as much annually as that of Ireland. Yet none of these public avocations pre-

vented his making important discoveries in science. The Leyden experiment in ELECTRICITY had rendered that science an object of general curiosity, Mr Franklin applied himself to it, and distinguished himself so eminently in that science as to attract the attention and applause of not only the Count de Buffon, and other French philosophers, but even of Lewis XV. himself. He was the first who thought of securing buildings from lightning; and he was also the first inventor of the electrical kite; having completed his experiment in June 1752, a full year before M. DuRoi's discovery. His theory of positive and negative electricity has likewise received the sanction of public approbation; though many think it not fully capable of supporting itself. See ELECTRICITY, *Index*. His theories were at first opposed by the members of the Royal Society in London; but in 1755, when he returned to America, they voted him the gold medal, which is annually given to the author of a memoir on the most curious and interesting subject. He was likewise admitted a member of the Society, and had the degree of LL. D. conferred upon him by the universities of St Andrews, Edinburgh, and Oxford. When the war broke out between Britain and France, he returned to America, to take a share in the public affairs of his native country. About 1753, he set on foot, and prevailed upon the Assembly to establish the Pennsylvania hospital. In 1754, the American colonies having suffered much by the depredations of the Indians on their frontiers, he drew up and presented to the commissioners from several colonies, a plan of union (called the *Albany Plan*, from the place where it was first met,) which, though unanimously approved by the commissioners, was at last rejected, by the assemblies, as giving too much influence to the president, who was to be appointed by the British, and disapproved of by the British ministry, as giving too much power to the representatives of the people. This rejection on both sides affords the strongest proof of the excellency and impartiality of his plan, as suited to the situation of Britain and America at that period. It appears to have steered exactly between the opposite interests of both countries. In 1757, he restored tranquility to the province, by an amicable and equitable settlement of the differences that had long subsisted between the proprietaries and the people, as to taxation. In 1766, he travelled into Holland and Germany, and in 1767, he visited France, and was every where received with the greatest marks of attention by men of science. He was introduced in the latter kingdom to Lewis XV. Returning to England in 1767, he was examined before the house of commons concerning the Stamp act. In 1773, having been appointed agent for Pennsylvania, he again came over to England, while the disputes between Great Britain and America were on the point of coming to extremities; when he attracted the public attention by a letter on the duel betwixt Mr Whatley and Mr Temple, concerning the publication of gov. Hutchinson's letters. On the 28th Jan. 1774, he was examined before the privy council on a petition he had presented long before, as agent for Massachusetts Bay against Mr Hutchinson: but this

being disagreeable to ministry, was precipitately rejected, and Dr Franklin was soon removed from his office of postmaster general. He was now looked upon by government with a jealous eye, that it was proposed to treat him as a fomentor of rebellion. The Doctor, however, departed for America in the beginning of 1775 with such privacy, that he had left before it was suspected that he entertained such design. Being elected a delegate to the Continental Congress, he had a principal share in drawing up the declaration of independence. In 1776 he was deputed by Congress to Canada, to persuade the Canadians to throw off the British yoke; but they had been so disgusted with the hot-headed zeal of the English, who had burnt some of their towns, that they refused to listen to the proposition, though enforced by all the arguments Dr Franklin could urge. On his return to Philadelphia, Congress, sensible how much he was esteemed, sent him to finish the negotiations with Silas Dean. This important commission was readily accepted by the Doctor, though then in the 71st year of his age. The event is well known; a treaty was signed between France and America; and M. le Roi asserts, that the Doctor had advised M. Maurepas not to lose a single day, if he wished to secure the friendship of America, and to detach it from the mother country. In 1777 he was regularly appointed plenipotentiary from Congress to the French court. He had just seen the full accomplishment of his mission by the conclusion of the peace in 1783, which confirmed the independence of America, and he was about to be recalled, and Mr Jefferson was sent to succeed him. Dr Franklin arrived in Philadelphia in Sept. 1785, and was received with the acclamations of a vast multitude, who conducted him in triumph to his own house. For many days he was visited by the members of Congress and the principal inhabitants. He was afterwards twice elected president of the assembly. In 1786, he was appointed a delegate from Pennsylvania, for revising the articles of confederation; and he signed the new constitution in the name of the State. He was also chosen president of the *American Society for alleviating the miseries of the African*, and of the *Pennsylvania Society for promoting the Abolition of Slavery*. His last public act was a memorial on this subject, 12th Feb. 1789. The greatest part of his life he had been afflicted with asthma. In 1735, indeed, he was attacked with a pleurisy, which ended in a suppuration of the lower lobe of the lungs, so that he was almost suffocated by the quantity of matter thrown up. In this, as well as another attack, he recovered completely, that his breathing was not affected. As he advanced in years, however, he was again subject to fits of the gout, to which interictic colic was added. From this time he was also subject to the stone, and during the last year of his life these complaints almost confined him to his bed; notwithstanding which, neither his mental abilities nor his health forsook him. His memory was tenacious to the last; a remarkable instance of which was, that he learned to speak French after he was

70. About 16 days before he died, he was seized with a feverish disorder; which, about the 3d or 4th day, was attended with a pain in the left breast, accompanied with a cough and laborious breathing. Thus he continued for 5 days, when the painful symptoms ceased; but a new impotency had now taken place in the lungs, which suddenly breaking, he was unable to expectorate the matter fully. Hence the difficulty of respiration increased, and he expired on the 17th April 1790. He left one son, governor William Franklin, a zealous loyalist; and a daughter, married to Mr William Bache merchant in Philadelphia, who waited upon him during his last illness. Dr Franklin was sententious but not fluent in society; more inclined to listen than to talk; and an instructive rather than a pleasing companion. With regard to religion, after renouncing his sceptical principles, as neither true nor beneficial to society, he became a firm believer in the Scriptures; and his sentiments on death may be gathered from a letter written about 35 years ago to Miss Hubbard on the death of her father-in-law and his brother, Mr John Franklin. "We are spirits (says he); That bodies should be lent us while they can afford us pleasure, assist us in acquiring knowledge, or doing good to our fellow creatures, is a kind and benevolent act of God. When they become unfit for these purposes, and afford us pain instead of pleasure; instead of an aid they become an incumbrance, and answer none of the intentions for which they were given: it is then equally kind and benevolent, that a way is provided by which we may get rid of them. Death is that way. Our friend and we are invited abroad, on a party of pleasure, that is to last for ever. His carriage was first ready, and he is gone before us; we could not all conveniently start together; and why should you and I be grieved at this, since we are soon to follow, and know where to find him?" The Doctor was author of many tracts on electricity, and other branches of natural philosophy, on politics and miscellaneous subjects. The following epitaph on himself was written by Dr Franklin many years before his death:

The BODY of
BENJAMIN FRANKLIN, PRINTER,
Like the COVER of an OLD BOOK,
Its contents torn out,
And stript of its lettering and gilding,
Lies here food for worms.
Yet the WORK itself shall not be lost;
For it will (as he believed) appear once more,
In a NEW and MORE BEAUTIFUL EDITION,
Corrected and amended

BY THE AUTHOR.

(II.) FRANKLIN, Thomas, D. D. chaplain to his majesty, was the son of Richard Franklin, printer of a famous anti-ministerial paper called, *The Craftsman*; in the conducting of which he was greatly assisted by Lord Bolingbroke, Mr Pulteney, and other excellent writers, who opposed Sir Robert Walpole's measures. By Mr Pulteney's advice, young Franklin was devoted to the church, under a promise of being provided for by the patriot; who, however, forgot it, and neglected him. He was educated at Westminster; whence

whence he went to Cambridge, became fellow of Trinity college, and professor of Greek. In Dec. 1758, he was named vicar of Ware and Tunbridge; afterwards lecturer of St Paul's, and at last rector of Braford in Kent. He was long a favourite in the literary world. His translations of Phalaris, Sophocles, and Lucian, evince his learning and genius, as they are equally distinguished for fidelity, and congeniality with the spirit of the originals. He suffered a translation from the French of Voltaire's works to be printed in his name; but the Orestes and Electra are supposed to be all that were really by him. His own dramatic compositions, particularly the tragedies of *The Earl of Warwick* and *Matilda*, are deservedly esteemed. He died, March 15, 1784.

(III.) * **FRANKLIN.** *n. s.* [from *frank.*] A steward; a bailiff of land. It signifies originally a little gentleman, and is not improperly Englished a gentleman servant. Not in use.—

A spacious court they see,
Both plain and pleasant to be walked in,
Where them does meet a *franklin* fair and free.

Fairy Queen.

(IV—XIX.) **FRANKLIN**, in geography, the name of 6 counties, 8 townships, an island, and a fort, in the United States of America, viz.

1. **FRANKLIN**, a county of Georgia, in the Upper District, seated on the Tugulo, which separates it from S. Carolina, containing 885 citizens, and 156 slaves, in 1790.

2. **FRANKLIN**, a populous and well cultivated county of Kentucky, bounded by Scott, Shelby, Fayette, and Woodford counties. Frankfort is the capital.

3. **FRANKLIN**, a county of N. Carolina, in Halifax district, bounded by the Greenville, Warren, Johnston, Wake, and Orange counties; containing 4842 citizens, and 2717 slaves, in 1790. Lewisburg is the chief town.

4. **FRANKLIN**, a fertile county of Pennsylvania, seated chiefly between the N. and S. Mountains, comprehending 800 square miles, or 512,000 acres. It is divided into 11 townships, and contained 15,325 citizens, and 330 slaves, in 1790. Iron is found in it. Chambersburg is the capital.

5. **FRANKLIN**, a county of Vermont, bounded on the N. by Lower Canada, and W. by Lake Champlain; containing 25 townships.

6. **FRANKLIN**, a county of Virginia, bounded by Bedford, Campbell, Patrick, and Montgomery counties; 40 miles long and 25 broad. It comprehends a part of the Alleghany mountains on the NW. and contained 5769 citizens, and 1073 slaves, in 1790.

7. **FRANKLIN**, an islet of Maine district, in Lincoln county, in the mouth of St George's river, 12 miles S. of Thomaston.

8. **FRANKLIN**, a township of Connecticut, in New London county, 6 miles NW. of Norwich, containing above 1000 citizens, in 1790, chiefly farmers.

9. **FRANKLIN**, a township of Massachusetts, in Norfolk county, bounded on the N. by the Charles, containing 1700 acres, and above 1100 citizens, 30 miles S. of Bolton.

10—13. **FRANKLIN**, four townships of Pennsyl-

vania, in Fayette, Washington, W. and York counties.

14, 15. **FRANKLIN**, two townships of in Delaware and Dutchess counties.

16. **FRANKLIN, FORT**, a fort of P in Alleghany county, near Venango, bank of the Alleghany, 63 miles N. of Lon. 79. 41. W. Lat. 41. 1. N.

FRANKLINIAN DOCTRINE, or electricity. See **ELECTRICITY**, *Inde.*

FRANKLINVILLE, a town of K miles ESE. of Frankfort.

* **FRANKLY.** *adv.* [from *frank.*] ly; freely; kindly; readily.—

Oh, were it but my life,
I'd throw it down for your deliver
As *frankly* as a pin. *Shak. Me.*

If ever any malice in your heart
Were hid against me, now forgive

Shak.

—When they had nothing to pay, he gave them both. *Luke*, vii. 42.—By the of the earth the sap cannot get up to spryly as it should do. *Bacon's Nat. Hist.*—garden more for being full of blackbirds, and very *frankly* gave them fruit for *Spect.* 2. Without constraint.—The ted their servants upon their own horse with the volunteers, who *frankly* listened amounted to a body of two hundred horse. *Clarendon.* 3. Without referred very *frankly* into those new del were contrived at court. *Clarendon.*

* **FRANKNESS.** *n. s.* [from *frank*] nels of speech; openness; ingenuou the Conde duke had some eclairecism duke, in which he made all the protest sincere affection, the other received him with all contempt; and declared, with cellary *frankness*, that he would have with him. *Clarendon.*—Tom made a man of sense, and always treated her ring the whole time of courtship: his per and good breeding hindered him any thing disagreeable, as his sincerit nels of behaviour made him converse fore marriage in the same manner he do afterwards. *Addis. Guardian.* 2. bounteousness. 3. Freedom from delivered with the *frankness* of a true word by word, what Kalandar ha touching the strange story. *Sidney.*—men that ever were, have had all an c *frankness* of dealing, and a name of c veracity. *Bacon.*

FRANKPIEDGE. See **FRANK**,

(1.) **FRANKS, FRANCES, FRANK** quis, a name which the Turks, Arab &c. give to all the people of the west Europe. The appellation is common to have had its rise in Asia, at the erofades; when the French made it fiderable figure among the croiées: time the Turks, Saracens, Greeks, &c. used it as a common term for a tians of Europe, and called Europe **KISTAN.** The Arabs and Mahometans

term *Franks* not only to the name originally belonging to the Latins and Europeans in general, but also to the appellation *Franks*, by which the Greeks, he says, at first called the *Franci*, or German Franks, who were settled in Gaul; (see **FRANCE**), and after they had been conquered by the Romans, and at length they extended it to all the sense is the name used by several writers, as *Comnenus*, &c. who to distinguish them from the *western Franks*, called them the *eastern Franks*, that about the time of Charlemagne distinguished eastern France, western or Roman France, and Germany, which was the ancient France after **FRANCONIA**.

FRANKSTOWN.

FRANKSTADT, a town of Moravia, in Prerau, 4 miles S. of Freyberg.

FRANKSTADT. See **FRAUSTADT**.

FRANKTOWN, or **FRANKS**, a town and borough of Pennsylvania, in Huntingdon county, on the branch of the Juniatta, 20 miles W. of Harrisburg.

FRANKFELD, or **PUSKOWITZ**, a town of Prussia, 12 miles NW. of Festenberg.

FRANKOU, a town of France, in the dept. of the Nord, 12 miles W. of Abbeville.

FRANMONT, a town of the Helvetic Republic, on the Doubs, 16 miles N. of Besancon and 23 W. of Soleure.

FRANVILLE, a town of France, in the dept. of the Seine, 6 miles SE. of Rouen.

FRANKS. See **FRANKS**, N° 1.

FRANTICK. *adj.* [corrupted from *phrenetick*, Lat. *phreneticus*.] 1. Mad; deprived of reason by violent madness; outrageously mad.

He wonders what makes him so glad,
As ' merry fruit they did invent,
That *frantick* rites have made them mad.

Fairy Queen.
Tossed by violence of passion; outrageous.—Esteeming, in the *frantick* error of the senses, the greatest madness in the world, and the highest wisdom foolishness.

At a height their *frantick* passion grows,
And both love, both hazard to destroy.

Dryden.
She has her hair, and, *frantick* in her griefs,
Lucia.

Addison's Cato.
Mad.—

The lover, *frantick*,
His beauty in a brow of Egypt. *Shak.*
FRANTICKLY. *adv.* [from *frantick*.] Mad-
dly; outrageously.—

How *frantickly* I square my talk.

Shak.
FRANTICKNESS. *n. s.* [from *frantick*.] Mad-
ness; distraction.

FRANKFORD, a town of Silesia, in the prin-
ce of Neisse, 4 miles N. of Neisse.

FRANKFURT, Wolfgang, professor of divi-
nity at Erfurt, was born in 1564. He wrote,

PART I.

1. *Animalium Historia Sacra*: 2. *De Interpretatione Sacrarum Scripturarum*. He died in 1620.

FRANZBURG, a town of Up. Saxony, in Swedish Pomerania, founded in 1587, 14 miles S. of Stralsund. Lon. 30. 36. E. of Ferro. Lat. 54. 9. N.

FRASCATI, or **FRESCATI**. See **FRESCATI**.

(1.) **FRASERBURGH**, or **FRASERSBURGH**, a small sea-port town in Aberdeenshire, seated on the S. extremity of the Murray Frith, called Kinnaird's Head. It was erected in the 16th century, on Sir *Alex. Fraser's* estate, whence the name. It has a good harbour, made and kept up at a considerable expence by the proprietor and the town, and well adapted for building small vessels. There are from 12 to 15 feet water within the harbour, and 20 feet immediately without at spring tides; without is a tolerable road for shipping, in a bay nearly a league in length and half a league in depth, with good anchorage in a sandy bottom. Vessels of about 200 tons burden enter the harbour. Fraserburgh contains about 1600 inhabitants, and is well situated for trade with the east coast of Europe. The town has lately advanced considerably, and requires only encouragement to render it a port of importance. At present it carries on a small trade to the east sea; several manufactories are forming in its neighbourhood. It is 16 miles E. of Banff, and 40 N. of Aberdeen. Lon. 1. 16. E. of Edinburgh. Lat. 57. 37. N.

(2.) **FRASERBURGH**, a parish of Scotland, on the coast of Aberdeenshire, so named from the above town, (N° 1.) but anciently called **PHILORTH**. It is 6 miles long from N. to S. 3½ broad, and 4 along the coast; comprehending above 10,000 acres, intersected by the parish of Rathven. The soil is various but mostly fertile, though intermixed with mosses and moors. The climate is dry and healthy, and many of the natives long-lived. Husbandry is much improved, and inclosures are general. Barley, oats, pease, and beans, are the most general produce; potatoes, turnips, cabbages, and clover, are also cultivated, with some wheat and flax. The population in 1792, stated by the rev. Alexander Simpson, in his report to Sir John Sinclair, was 2200, and had increased 518 since 1755. Linen yarn is the chief manufacture. Kelp is also made on the coast. Cod, ling, turbot, haddocks, lobsters, &c. are taken in great quantities. Fish and grain are exported.

FRASLA, a town of Germany, in the duchy of Stiria, 10 miles W. of Cilly.

FRASSINETO, a town of Naples, in the prov. of Bari, 9 miles SSW. of Conversano.

FRASTENTZ, a town of Germany, in the county of Feldkirk, 2 miles E. of Feldkirk.

FRAT, the name given by the Asiatics to the **EUPHRATES**.

(1.) **FRATELLI**, two small islands in the Mediterranean, 25 miles W. of Scarpanto.

(2.) **FRATELLI**. See **FRATRIBELLI**.

(1.) **FRATELLINI**, Joanna, a celebrated Italian paintress, born at Florence, in 1666. She acquired an excellent stile in painting historical subjects and miniatures, and was patronized by the archduchess Victoria. She died in 1731.

K

(2.) **FRAT**

(2.) **FRATELLINI**, Laurence Maria, the son of Joanna, (N^o 1.) was born in 1690, and studied under Gabbiani. He painted portraits, animals, landscapes, and historical subjects, admirably. He died in 1729.

(1) * **FRATERNAL**, *adj.* [*fraternal*, French; *fraternus*, Lat.] Brotherly; pertaining to brothers; becoming brothers.—

One shall rise

Of proud ambitious heart; who, not content

With fair equality, *fraternal* state,

Will arrogate dominion undeserv'd,

Over his brethren. *Milton's Par. Lost.*

—The admonitions, *fraternal* or paternal, of his fellow Christians, or of the governors of the church; then more public reprobations; and upon their unsuccessfulness, the censures of the church, until he reform and return. *Hammond.*—

Plead it to her,

With all the strength and heats of eloquence,

Fraternal love and friendship can inspire.

Addis. Cato.

(2.) **FRATERNAL AFFECTION** is the love and attachment subsisting among, or due to one another by, children of the same family. An hearty benevolence, an ardent concern for each other's welfare, and a readiness to serve and promote it, are the peculiar offices of this relation. See *Cicero, De Officiis.*

* **FRATERNALLY**, *adv.* [from *fraternal*.] In a brotherly manner.

FRATERNISATION, *n. s.* [from *fraterniser*, Fr. to fraternise,] one of the many new words to which the French revolution has given birth, literally signifies the act of living together as brethren; but in an enlarged sense, it is used for the act of one nation voluntarily agreeing with another, to be governed by the same laws, or to live in strict alliance, and under the same democratical form of government, with another.

To **FRATERNISE**, *v. n.* [*fraterniser*, Fr.] To live together like brothers. *Bailey.* This verb is also now used in the same enlarged political sense with the noun. See last article.

(1.) * **FRATERNITY**, *n. s.* [*fraternité*, Fr. *fraternitas*, Lat.] 1. The state or quality of a brother. 2. Body of men united; corporation; society; association; brotherhood. — 'Tis a necessary rule in alliances, societies, and *fraternities*, and all manner of civil contracts, to have a strict regard to the humour of those we have to do withal. *L'Esrange.* 3. Men of the same class or character.—With what terms of respect knaves and fops will speak of their own *fraternity*. *South.*

(2.) **FRATERNITY**. See COMPANY and GUILD.

(3.) **FRATERNITY**, in the Roman Catholic system, signifies a society for the improvement of devotion. Of these there are several sorts; as, 1. The fraternity of the refectory, founded by St Dominic. It is divided into two branches, called the *common refectory* and the *perpetual refectory*; the former of whom are obliged to confess and communicate every first Sunday in the month, and the latter to repeat the refectory continually. 2. The fraternity of the sepulchry, whom the blessed Virgin, according to the sabbatine bull of pope John XXII. has promised to deliver out of hell the first Sunday after their death. 3. The fraternity of St

Francis's girdle are clothed with a sack colour, which they tie with a cord; ancessions walk bare-footed, carrying in th a wooden cross. 4. That of St Austin's girdle comprehends many devotees. Ital and Portugal are the countries where the number of these fraternities, some of which the name of *arch-fraternities*, are to be Pope Clement VII. instituted the arch of charity, which distributes bread every among the poor, and gives portions to girls on the feast of St Jerome their pa The fraternity of death buries such dead abandoned by their relations, and causes be celebrated for them.

FRATHORP, a town S. of Burlington

FRATINO, a town of Maritime A the prov. of Triuli, 9 miles W. of Conco

FRATRES ARVALES. See ARVALES

FRATRIAGE, *n. s.* the partition anthers, or coheirs, coming to the same int

FRATRICELLI, or **FRATELLI**, [Ital. *terculi*, little Brothers,] in ecclesiastical hi enthusiastic sect of Franciscans, which ro ly, particularly in Ancona, about A. 1 The word was used as a term of derision were most of them apostate monks.

reason the term, as a nick-name, was many other sects, as the Catharists, W &c. however different in their opinion their conduct. But this denomination, at the austere part of the Franciscans, was ed as honourable. See FRANCISCANS. I ders were P. Maurato, and P. de Foss who having obtained of pope Celestin mission to live in solitude, after the manne mits, and to observe the rule of St Fra its rigour, several idle vagabond monk them, who, living after their own fan making all perfection to consist in pover soon condemned by pope Boniface VIII successor, and the inquisitors ordered to against them as heretics; which commit executed with their usual barbarity. U retiring into Sicily, Peter John Oliva de had no sooner published his Comment c pocalypse, than they adopted his opinion held the Romish church to be Babylon, posed to establish another far more per They maintained, that the rule of St Fra the evangelical rule observed by Jesus C his apostles. They foretold the reformati church, and the restoration of the true Christ, by the genuine followers of St and declared their assent to almost all the which were published under the name o bet Joachim, in the "*Introduction to the ing Gospel*," a book published in 1250, plained by one of the spiritual friars, wh was Gerhard. Among other enormiti cated in this book, it is pretended that s was the angel mentioned in Rev. xiv, 6. promulgated to the world the true and e gospel of God; that the gospel of Chri be abrogated in 1260, and to give place to gospel; and that the ministers of this gn mation were to be humble and bare-foot destitute of all worldly employments. &

elect a pope of their church; at least elected a general, with superiors, and built cities, &c. Besides the opinions of Oliva, &c. that the sacraments of the church were because those who administered them, were an abuse of power or jurisdiction. They were condemned by pope John XXII. in case of whose cruelty they regarded him as antichrist; but several of them returned to Germany were sheltered by Lewis, duke of Bavaria, the emperor. There are authentic records which it appears that no less than 2000 were burnt by the inquisition, from 1318 to the time of Innocent VI. for their inflexible attachment to the poverty of St Francis. The strongest of them were again revived towards the end of the 15th century, by pope Nicolas V. and his successors. However, all the persecutions, his sect endured, were not sufficient to destroy it; for it subsisted till the time of the reformation in Germany, when its remaining votaries embraced the doctrine and discipline of Luther. This has led Popish writers to charge it with many enormities, some of which are mentioned by Bayle, under the article, FRAUD.

They had several other denominations were called *Dulcini*, from one of their chiefs; *Bizzochi*, *Requins*, and *Begharai*.
FRATRICIDE. *n. s.* [*fratricide*, French; *fratricida*, Lat.] The murder of a brother.
FRATTA, a market town of Maritime Austria, 10 m. of Rovigo, on the Soortico, containing churches, and many palaces.
FRIBRUNNEN, a town of the Helvetic republic, 5 miles N. of Bern, near which a battle was fought by the Bernese over an army of English, and Normans, under S. de Coureay.
FRAUD. *n. s.* [*fraus*, Lat. *fraude*, Fr.] Deceit; trick; artifice; subtilty; stratagem.

Our better part remains
 in close design, by *fraud* or guile,
 which force effected not. *Milton.*

we need the *frauds* of sly Ulysses' fear.
Dryden's Æn.

If success a lover's toil attends,
 asks if force or *fraud* obtains his ends.
Pope.

FRAUD, in law, signifies deceit in grants, advances of lands, &c. or in bargains and goods, &c. to the damage of another person. A fraudulent conveyance of lands or goods, to defraud creditors, as to creditors is void in law. A fraudulent conveyance, to defraud purchasers, is void; and the persons giving or putting off such grants as goods, shall forfeit the value of the lands, and the full value of the goods and chattels, and likewise shall be imprisoned. See CHEAT, § 3.

FRAUDFUL. *adj.* [*fraud* and *ful*.] Treacherous; artful; trickish; deceitful; subtle.—
 The welfare of us all
 hangs on the cutting throat that *fraudful* man.
Shak. Hen. VI.

He, full of *fraudful* arts,
 well-invented tale for truth imparts.
Dryden's Æn.

FRAUDFULLY. *adv.* [from *fraudful*.] Deceitfully; artfully; subtilly; treacherously; by stratagem.

* **FRAUDULENCE**. *n. s.* [*fraudulentia*, Lat.]
 * **FRAUDULENCY**. *n. s.* Deceitfulness; trickishness; proneness to artifice.—We admire the Providence of God, in the continuance of the Scripture, notwithstanding the endeavours of infidels to abolish, and the *fraudulence* of hereticks always to deprave the same. *Hesker.*

* **FRAUDULENT**. *adj.* [*fraudulens*, Fr. *fraudulentus*, Lat.] 1. Full of artifice; trickish; subtle; deceitful.—
 He with serpent tongue
 His *fraudulent* temptation thus began. *Milton.*

She mix'd the potion, *fraudulent* of soul;
 The potion mantled in the golden bowl. *Odys.*
 2. Performed by artifice; deceitful; treacherous.—
 Now thou hast aveng'd
 Supplanted Adam,
 And frustrated the conquest *fraudulent*. *Milton.*

* **FRAUDULENTLY**. *adv.* [from *fraudulent*.]
 By fraud; by deceit; by artifice; deceitfully.—
 He that by fact, word, or sign, either *fraudulently* or violently, does hurt to his neighbour, is bound to make restitution. *Taylor.*

FRAUENBACH, a river of Saxony, which runs into the Elbe, 2 miles SW. of Colleda, in Thuringia.

(1.) **FRAUENBERG**, a town of Bohemia, in the circle of Pilsen, 5 miles SW. of Hayd.

(2.) **FRAUENBERG**, a town of Bavaria, in the palatinate of Neuburg, 9 miles NW. of Ratisbon.

FRAUENBOURG, a town of Prussia Royal, in Poland, on the river Frisch haff, 6 or 7 leagues from Elbing, to the NE. In the cathedral of Frauenbourg is the tomb of the great COPERNICUS, on the subject of which the eminent John BERNOULLI of Berlin wrote to D. S. Earl of Buchan a letter, dated the 22d of Feb. 1704, of which his lordship has favoured us with the following translation:—“In the year 1777, the bishop of Warmia, whom I met in the abbey of Oliva, near Dantzic, told me that he had the pleasure to discover, in his cathedral of Frauenbourg, the long neglected tomb of Copernicus. In the year 1778, on my journey to Russia, passing through that town, and having nothing to do during my short stay there, that could interest me more, I went to the cathedral in search of this precious monument. I knew nobody in Frauenbourg, but on the street I accosted a canon, whose countenance and manner encouraged my address, and I was not disappointed. He told me, that as for the spot where lay interred the ashes of Copernicus, there was no certainty, because it was usual to place the coffins of the deceased canons in a vault, where, in the course of time, from their number, it was impossible to distinguish them from each other; but that with respect to the sepulchral stone, it was a slab of marble, such as was usual for others of the same station, with the short inscription, NIC. COPERNICUS, THOR. That this stone had been hidden, from neglect, many years, and afterwards accidentally observed and placed in the chapter-house of the cathedral, with a view to consider maturely of a proper place for its erection. I regret, however, very much, that I did not make a point with my guide to shew me this stone, as, if

A part of the inscription be not effaced, it does not tally with that recorded by Gassendi, who says, p. 325, in his life of Copernicus, that bishop *Martin Cromer*, a celebrated Polish historian, caused to be erected to the memory of that great astronomer *unam tabulam marmoream*, with this inscription;

D. O. M.

N. D. NICOLAO COPERNICO
TORUNENSI. ARTIUM ET
MEDICINÆ DOCTORI.
CANONICO VARMIENSI.
PRÆSTANTI ASTROLOGO ET
EJUS DISCIPLINÆ INSTAURATORI.

MARTINUS CROMERUS
EPISCOPUS VARMIENSIS
HONORIS ET AD POSTERITATEM
MEMORIÆ CAUSA POSUIT.

M,D,LXXI.

Gassendi adds, that it was 36 years after the death of Copernicus; but this does not agree with the date of our stone. My Canon had for his apartment the Dormitory of Copernicus, and he kindly asked me to pay it a sentimental visit, an invitation you may believe I accepted with emotion, and enjoyed with pleasure. Above the range of the Dormitories there is another little apartment, which my guide allotted to the memory of his great predecessor, and which he has decorated with his portrait in oil colours, well preserved, and perhaps only a copy from some original painting. It was from this place that Copernicus enjoyed a fine scope of the heavens and a large horizon; here that he made the heavens his study, and rendered himself a luminary of the first magnitude, in the constellation of modern astronomers; and when he found it necessary to make his observations in the open air, there is a little gallery or terrace, that communicates with this apartment, and the adjoining steeple, or belfry, which served to accommodate the great Copernicus in his researches. You, my Lord, are able to conceive the divine satisfaction I enjoyed in this place!—classic and sacred!—where I inhaled as it were the spirit of departed greatness! and it was the shock of these transcendent emotions, that made me to forget the stone I have described in the former part of my letter, my time being elapsed and my carriage ready to depart. Near the cathedral my Canon showed me a large reservoir of water, with a high tower which contains the remains of a hydraulic machine, said to have been invented by Copernicus, for carrying and distributing the water by pipes to the different apartments of the canons, his brethren: a convenience now lost, and which, from the ruin of the machine, they are obliged to fetch from a fountain in the lower part of Frauenbourg. I have read in an old German Journal, that in the ancient town of KÖNIGSBERG there are or were preserved many of the books belonging to Copernicus at the time of his death, with his portrait in oil colours, which were purchased at Thorn, probably in his house in that town, possessed by the family so late as the year 1720; and in this house Copernicus was born.”—Frauenbourg was built in 1279, and lies 38 miles SW. of Königsberg.

FRAUENBREITUNGEN, a town of Prussia, in the county of Henneberg, on the 4 miles W. of Schmalkalden.

FRAUENBURG, a town in the duchy of Saxe, 20 miles SSE. of Goldingen.

FRAUENFELD, a town of the Helvetia, the capital of the late bailiwick of 7 It was taken from the Austrians by the 1460. Great part of it was burnt in 1771 20 miles NE. of Zurich. Lon. 8. 56. E. 35. N.

FRAUENMARCK, a town of Hungary NE. of Levens.

(1.) FRAUENSTEIN, a castle of Germany, 5 miles N. of Crainberg.

(2.) FRAUENSTEIN, a town of Upper Saxony, the Mulda, in Erzgebürg, 11 m. SSE. of F.

FRAUENTHAL, a town of Germany, duchy of Stiria, 10 miles S. of Voitsburg

(1.) * FRAUGHT. *n. f.* [from the past participle of *fraught*.] A freight; a cargo.—

Yield up, oh love, thy crown and throne

To tyrannous hate! swell, bosom, with
fraught;

For 'tis of aspicks tongues. *Shak.*

The bark that all our blessings bore
Charg'd with thyself and James, a double
fraught.

(2.) * FRAUGHT. *particip. pass.* [from the past participle of *fraught*.] 1. Laden; charged.

In the narrow seas that part
The French and English, there miscar
A vessel of our country, richly *fraught*
With joy

And tidings *fraught*, to hell he now re
Milton's Paradise Lost

And now approach'd their fleet from
fraught

With all the riches of the rising sun,
And precious sand from southern
brought.

2. Filled; stored; thronged.—The Sea
fraught even with the laws of nature. *H.*

By this sad Una, *fraught* with anguish
Arriv'd, where they on earth their bliss
spilt.

—I am so *fraught* with curious business
leave out ceremony. *Shak.*—Whosoever
mind *fraught* with many thoughts, his
understanding do clarify and break up in
communicating and discoursing with another

Hell, their fit habitation, *fraught* with
Unquenchable, the house of woe and
Milton's Paradise Lost

—Abdallah and Belfora were so *fraught*
kinds of knowledge, and possessed with
stant a passion for each other, that their
never lay heavy on them. *Addison.*

* To FRAUGHT. *v. a.* [for *freight*, by
tion.] To load; to crowd.—

Hence from my sight:

If after this command thou *fraught* the
With thy unworthiness, thou dy'st. *Shak.*

* FRAUGHTAGE. *n. f.* [from *fraught*.]
ing; cargo. A bad word.—

Our *fraughtage*, sir,
I have convey'd aboard. *Shak. Comedy of Errors*

full blossom, the air which surrounds it
light, may be inflamed by the approach
of a candle. Dr Watson doubts whether
flammability proceeds from an inflammable
d by the plant, or from some of the finer
the essential oil of the plant being dissol-
common atmospherical air. The latter,
he thinks, is most probable, for were it
inflammable air, it would, on account of
specific gravity, leave the plant as soon
it produced. Common air acquires the
of becoming inflammable, by being trans-
through several essential oils.

INUS, the *ASH*: A genus of the diœcia
longing to the polygamia class of plants;
natural method ranking under the 44th
series. There is no hermaphrodite calyx,
adipartite; and there is either no corolla,
trapatulous: there are two stamina; one
a lanceolated seed; and the pistil of the
in lanceolated. There are 6 species; of
the most useful is the common ash. See
1. If a wood of these trees is rightly
it will turn out greatly to the advantage
ner: for, by the underwood, which will
cut every 8 or 10 years, there will be a
income, more than sufficient to pay the
the ground and all other charges; and still
be a stock preserved for timber, which
years will be worth 40s. or 50s. per tree.
flourishes best in groves, but grows very
rich soil in open fields. It bears trans-
and lopping. In Lancashire they lop the
these trees to feed the cattle in autumn
grass is on the decline; the cattle peel
the bark as food. The wood has the sin-
property of being nearly as good when
when old. It is hard and tough, and is
ed to make the tools employed in hui-

The albes of the wood afford very good
The bark is used in tanning calf skin.
infusion of it appears of a pale yellowish
when viewed between the eye and the light;
when looked down upon, or placed betwixt
and an opaque object, it appears blue. This
is destroyed by the addition of an acid,

but recovered by alkalis. The seeds are acrid and
bitter. In the church-yard of Lochaber, Dr Wal-
ker measured the trunk of a dead ash tree, which,
at 5 feet from the surface of the ground, was 58
feet in circumference.—Horses, cows, sheep, and
goats eat it: but it spoils the milk of cows.

* FRAY. *n. s.* [*effrayer*, to fright, Fr.] 1. A bat-
tle; a fight.—

Time tells, that on that ever blessed day,
When Christian swords with Persian blood were
dy'd,

The furious prince Tancredi from that *fray*
His coward foes chased through forests wide.

Fairfax.

After the bloody *fray* at Wakefield fought.

Shak. Henry VI.

He left them to the fates in bloody *fray*,
To toil and struggle through the well-fought
day.

Pope.

2. A duel; a combat.—

Since, if we fall before th' appointed day,
Nature and death continue long their *fray*.

Denham.

The hoaster Paris oft desir'd the day

With Sparta's king to meet in single *fray*. *Pope.*

3. A broil; a quarrel; a riot of violence.—

I'll speak between the change of man and boy
With a reed voice, and turn two mincing steps
Into a manly stride; and speak of *frays*,
Like a fine bragging youth.

Shak.

* To FRAY. *v. u.* [*effrayer*, Fr.] 1. To fright;
to terrify.—

The panther, knowing that his spotted hide
Doth please all beasts, but that his looks them
fray,

Within a bush his dreadful head doth hide,
To let them gaze, whilst he on them may prey.

Spenser.

So diversly themselves in vain they *fray*,

Whilst some more bold to measure him stand
night.

Spenser.

—Fishes are thought to be *frayed* with the motion
caused by noise upon the water. *Bacon's Nat. Hist.*

—These vultures prey only on carcases, on such
stupid minds as have not life and vigour to *fray*
them away. *Gov. of the Tongue.* 2. [*frayer*, Fr.]
To rub.

FRAYLES, a cluster of islands in the W. Indies,
6 miles NE. of Margarita.

FRAYPONT, a town of the French republic,
in the dep. of Ourte, and ci-devant bishopric of
Liege; seated on the Weze; 8 miles SE. of Liege.

FRAZE, a town of France, in the dep. of Eure
and Loire; 12 miles E. of Nogent le Rotrou.

FRAZERSBURG. See FRASERBURGH.

FREA, or FRIGGA, the wife of Odin, or Wo-
den, was, next to him, the most revered divinity
among the Heathen Saxons, Danes, and other
northern nations. As Odin was believed to be fa-
ther, Frea was esteemed the mother of all the o-
ther gods. In the earliest times, Frea was the
same with the goddesses HERTHUS, or EARTH,
who was so devoutly worshipped by the Angli
and other German nations. But when Odin, the
conqueror of the north, usurped the honours due
only to the true Odin, his wife Frea usurped those
which had been formerly paid to mother Earth.
She was worshipped as the goddess of love and
pleasure,

pleasure, who bestowed on her votaries a variety of delights, particularly happy marriages and easy births. To Frea the sixth day of the week was consecrated, which still bears her name, *Friday*, or *Frea's day*.

* **FREAK**. *n. s.* [*frecb*, Germ. *fucy*, petulant; *frac*, Sax. fugitive.] 1. A sudden and causeless change of place. 2. A sudden fancy; a humour; a whim; a capricious prank.—

O! but I fear the fickle *freaks*, quoth she,
Of fortune, and the odds of arms in field. *F. Q.*
—When that *freak* has taken possession of a fantastical head, the distemper is incurable. *L'Estr.*
—She is restless and peevish, and sometimes in a *freak* will instantly change her habitation. *Spett.*

To vex me more, he took a *freak*

To slit my tongue, and make me speak. *Swift.*

* To **FREAK**. *v. a.* [A word, I suppose, Scotch, brought into England by *Thomson*.] To variegate; to checquer.—

There furry nations harbour:

Sables of glossy black, and dark embrown'd,
Or beauteous, *freak'd* with many a mingled hue.

Thomson.

* **FREAKISH**. *adj.* [from *freak*.] Capricious; humourish.—It may be a question, whether the wife or the woman was the more *freakish* of the two; for she was still the same uneasy top. *L'Estr.*

* **FREAKISHLY**. *adv.* [from *freakish*.] Capriciously; humourishly.

* **FREAKISHNESS**. *n. s.* [from *freakish*.] Capriciousness; humourishness; whimsicalness.

FREAM, *n. s.* in husbandry, ploughed land worn out of heart, and laid fallow till it recover.

* To **FREAM**. *v. n.* [*fremere*, Lat. *fremir*, Fr.] To growl or grunt as a boar. *Bailey.*

FREATS, or **FREITS**, *n. s. obs.* a term still used in Scotland for *ill omens*, and sometimes denoting accidents supernaturally unlucky. K. James VI. in his *Demonologie*, MS. pen. Edit. B. I. ch. IV. p. 13.

“But I pray you forget not lykeways to tell what are the Devill's rudimentis? E. His rudimentis I call first in general all that quhilk is called vulgairelie the virtu of woode, herbe, and staine; quhilk is used by unlawfull charmis without natural causis. As lykeways all kynd of prattiques, *freitis*, or uther lyk extraordinair actions, quhilk cannot abyde the tressw twiche of natural raison.” It occurs again in the same sense in p. 14, *marg. note*; and in p. 41, speaking of *Sorcerers*; “And in generall that naime was gevin thaine for using of sic chairmis and *freitis*, as that craft teachis thaine.”

FRECHILLA, a town of Spain in the province of Leon; 17 miles NW. of Valencia.

FRECKELBEN, a town of Upper Saxony, in Anhalt-Deßau; 30 miles WSW. of Deßau.

FRECKENHORST, a town of Westphalia, in the bishopric of Munster, 1 m. SW. of Wardendorf.

(1.) * **FRECKLE**. *n. s.* [*flecch*, a spot, German; whence *fleckle*, *freckle*.] 1. A spot raised in the skin by the sun.—

Ruddy his lips, and fresh and fair his hue;
Some sprinkled *freckles* on his face were seen,
Whose dusk set off the whiteness of the skin.

Dryden.

2. Any small spot or discoloration.—

The cowslip tall her pensioners be;
In their gold coats spots you see:

Those be rubies fairy favours;

In those *freckles* live their favours. S
—The farewell frosts and easterly wind
your tulips; therefore cover such with
prevent *freckles*. *Evelyn.*

(2.) **FRECKLES** (**LENTIGINES**) are a yellowish colour, of the bigness of a lentil, scattered over the face, neck, and hands. They are either natural, or proceed from the action of the sun upon the part. A sudden change of weather will often make the skin appear of a darker colour than is natural, and thereby produce what is called *tan*, *sunburn*, *morpheau*; which seem to differ only in degree, and usually disappear in winter. Persons of a fair complexion, and those whose hair is red, are most subject to freckles, especially in parts exposed to the sun and air. To remove freckles, put a few lemons in a glass vial, and, mixing it with oil and borax finely powdered, let it digest for some days, and then use it. Homberg proposes gall mixed with alum, and, after the precipitation, exposed 3 or 4 months to the sun in a close vial, as one of the best menstrua for removing freckles.

* **FRECKLED**. *adj.* [from *freckle*.] Spotted; discoloured with small spots.

Sometimes we'll angle at the brook
The *freckled* trout to take
With filken worms. *Drayton.*

The even mead that erst brought swarms
The *freckled* cowslip,
Wanting the scythe, all uncorrected,
Conceives by idleness. *Spenser.*

Now thy face charms ev'ry shepherd
Spotted over like a leopard;
And, thy *freckled* neck display'd,
Envy breeds in ev'ry maid.

* **FRECKLY**. *adj.* [from *freckle*.] Full of freckles.

* **FRED**. The same with *peace*; as our forefathers called their sanctuaries *i. e.* the seats of peace. So *Frederick* is or wealthy in peace; *Winifred*, victorious; *Reinfred*, sincere peace. *Gibson's Canine.*

FREDBERG, or **FREDEBERG**, a rich town of Germany, in Misnia, remarkable for being the burying-place of princes and of the house of Saxony. A lightful place, seated on the river Mulda 40. E. Lat. 51. 2. N.

FREDDO, a river of Sicily, in the valley of the mona, which runs into the Mediterranean.

FREDEBURG, or **FREDENBURG**, a town of Germany, in Westphalia, 52 miles E. of Cassel, and 50 W. of Cassel. Lon. 8. 16. E. Lat. 51. 16. N.

FREDEGARIUS, an ancient French king who wrote a *Chronicle*, which extends to 641; preserved in Duchesne's collection.

FREDELAND, a town of Prussia, in Pomerania, 60 miles SSW. of Dantzick.

FREDENBURG. See **FREDEBURG**.

FREDENWALDE, a town of Germany, in Brandenburg, 11 miles S. of Prenzlau.

(1.) **FREDEKICA**, a town of Delaware county, 7 miles N. of Milford, and 88 miles S. of Philadelphia.

(2.) **FREDERICA**, a town of Georgia, on the island of St Simons, at the mouth of the Savannah river.

and fortified by General Oglethorpe.

ICIA, a strong sea port town of Den- 300, Jutland, seated on the Little Belt. 300, Synagogue, 1 Calvinist, 1 Popish, 300, eren churches; a custom house, a 300, dock, and a good arsenal. Lon. 7. 4. 300, 37. N.

FREDERICK, the name of 11 Euro- 300, pers, viz. 2 emperors of Germany, 3 300, Denmark, and 2 kings of Prussia; and 300, names of other 2 kings of Prussia, and 300, . See DENMARK, § 6-8; GERMANY, 300, and PRUSSIA. Amongst these we shall 300, be notice of the 3 following:

FREDERICK I., king of Prussia, the son of 300, William, the Great, elector of Bran- 300, as born in 1657; and succeeded his 300, electorate, A.D. 1688. In 1700. he 300, a negotiation with the emperor, Leo- 300, ger Prussia erected into a kingdom; 300, this obtained by a singular accident. 300, arances were rather unpromising, he 300, letter from his minister written in 300, ring him to use the interest of a cer- 300, tain, he mistaking the ciphers, ap- 300, e emperor's confessor; who, being a 300, so much struck with the *honour* done 300, *Protestant elector*, that he exerted his 300, est and that of his order, to procure 300, and object. Frederick was according- 300, king of Prussia, Jan. 18, 1701. He 300, with many virtues. He was magni- 300, fers, constant to his marriage vows, 300, the true interest of his subjects, by 300, his dominions in peace. He was three 300, ed: his 2d queen was sister to king 300, He founded the university of Halle, 300, al academy at Berlin. He died in 1713.

FREDERICK II. surnamed the GREAT, K. of 300, ie of the greatest warriors the present 300, duced, was the son of Frederick-Wil- 300, hereditary prince of Brandenburg, and 300, ophia Dorothea, daughter of king 300, He was born in 1712, the year before his 300, ated the throne, who was so far from 300, ation of literature, that he regarded 300, it what related to the military art; and 300, generals scarce knew how to sign their 300, his son was of a disposition the very re- 300, ing put from his birth under the care of 300, coule, a French lady of great merit and 300, ling, he early acquired a taste for liter- 300, a predilection for the French language, 300, re never obliterated. At 7 years of age, 300, derick was put under the military tuition 300, Count de Finkestein, and Col. de Kalk- 300, cer, renowned for courage and experi-

ence. He was taught mathematics and fortifica- 300, tion by Major Senning; Han de Jendun, a French- 300, man, instructed him in other branches of know- 300, ledge; and a cadet of the name of *Kenzel*, taught 300, him his exercise. At 8, he was furnished with a 300, small arsenal, stored with all sorts of arms pro- 300, portioned to his age and strength, of which his 300, father left him absolute master. Soon after he 300, was named captain and chief of the corps of 300, cadets; and he performed every day, in minia- 300, ture, with his little soldiers, all the evolutions 300, with which his father exercised his giants. At 300, last he received the command of a company in 300, his father's famous gigantic regiment composed 300, of men of whom scarce one was short of 7 French 300, feet. Endued however, with a taste for the arts, 300, he devoted to their cultivation every moment he 300, could escape the vigilance of his guardians. He 300, was particularly fond of poetry and music, and 300, when he could find a moment's leisure, read 300, French authors, or played on the flute; but his 300, father, as often as he surprised him playing or read- 300, ing, broke his flute and threw his books into the fire. 300, The prince, chagrined at this treatment, and 300, having a great desire to visit Germany, England, 300, France, and Italy, desired permission to travel. 300, This, however, his father refused, but permitted 300, him to accompany himself occasionally into Ger- 300, many; and, in 1728, took him to Dresden to see 300, the king of Poland. By these little expeditions the 300, prince's desire to travel was only the more inflam- 300, ed; so that at last he resolved to set out without 300, his father's knowledge. The design was imparted 300, to two of his young friends, named *Kat* and *Keit*; 300, money was borrowed, and the day of departure 300, fixed, when unluckily the whole project was dis- 300, covered. The old king, indignant in his retri- 300, but, and considering his son as a deserter, de- 300, termined to put him to death. He was shut up 300, in the fortress of Custrin; and it was with diffi- 300, culty that the count de Senkendorf, sent purposely 300, by the emperor Charles VI. was able to alter the 300, king's resolution. Certain vengeance, however, 300, was determined on both his intended assassins. 300, Keit escaped the danger by flying into Holland; 300, but Kat had not that good fortune. The king 300, first directed that he should be tried by a court- 300, martial; but as they only sentenced Kat to per- 300, petual imprisonment, the revengeful monarch, by 300, an unheard-of exercise of his prerogative, caused 300, him to be beheaded. The execution was per- 300, formed under the windows of the prince, whose 300, face being held towards the scaffold by 4 gren- 300, diers, he fainted away at the shocking sight; and 300, during the remainder of his life he considered 300, capital punishments with so great a degree of 300, horror, that they were rare throughout his domi- 300, nions while he reigned. When the emperor had 300, succeeded in preventing the execution of Frederick, 300, the old king remarked, that "Autumn would 300, one day see what a serpent she had nourished." 300, The prince remained prisoner a year at Custrin; 300, during which time his father wished that he should 300, learn the maxims of government and finance. 300, For this purpose M. de Munchow, president of 300, the chamber of domains and finances, was order- 300, ed to make him assist at all their assemblies, to 300, consider him as a simple counsellor and to treat 300, him

him as such. But though Frederick assisted at their meetings, he did not trouble himself with reading acts or copying decrees. Instead of this, he amused himself sometimes with reading French pamphlets, and at others with drawing caricatures of the president or members of the assembly. Munchow was also very favourable to the prince at this time, by furnishing him with books and other articles of amusement, notwithstanding the express prohibition of his father; though in this he certainly ran a great risk of his life. Frederick, after this, was recalled to Berlin, on pretence of being present at the celebration of his eldest sister's marriage with the hereditary prince of Bareith; but the true reason was, that the king had now prepared a match for the prince himself. This was the princess Elizabeth Christina of Brunswick, niece to the empress. Frederick, who was not only totally indifferent to the fair sex in general, but particularly prejudiced against this princess, made some objections; his father, however, overcame all obstacles with "his usual arguments (says the author of the life of Frederick), viz. his cane, and a few kicks." But the coldness which Frederick at this time showed for the fair sex was not natural; for as early as 1723, though then only in his 11th year, he fell in love with the princess Anne, daughter of K. George II. Even at this early period he vowed to refuse every other but her for his consort; nor was his vow ever broken, as far as depended on himself. This marriage might have taken place, had it not been for some differences, which arose between the courts of Prussia and Hanover about *a few acres* of meadow land, and two or three Hanoverians enlisted by the Prussian recruiters. The princess whom he espoused had a large share of beauty, and, what was still better, an excellent heart; but Frederick is said to have suffered so much in his former amours, that certain unsurmountable impediments remained to the completing of his marriage with any woman. Scarcely therefore was he in bed with his young spouse, when a cry of *Fire!* was raised by his friends. Frederick got up to see where the conflagration was, but finding it a false alarm, he sent messengers to compose the princess; but neither that night, nor any other, did he ever disturb her rest. On this occasion, Frederick received from his father the county of Rupin. He resided in Rupin, the capital, for some time; but afterwards preferred Rheinsberg, which then contained only 1000 inhabitants. Having inscribed over the great gate of the castle, FREDERICO TRANQUILLITATEM COLENTI, his father was displeased with it, and therefore hurried him into the noise and tumult of war. The succession to the crown of Poland had kindled a general war throughout Europe, and the king of Prussia was to send 10,000 auxiliaries to the imperial army, then commanded by prince Eugene. The king conducted his troops in person, and took this opportunity of giving his son an idea of war. At this time, however, he learnt but little, and only saw, as he expressed it, the shadow of the great Eugene. That consummate general, however, predicted that he would one day be a great captain. Frederick having gone to reconnoitre the lines at *Philipburg*, in his return through a very open

wood, was exposed to the cannon which thundered incessantly. The number of branches on every side of withstanding which, he never caused move quicker; nor altered the main hand which held the bridle; but conversed calmly with the generals with him. During this campaign the health of the king was so much impaired, that Frederick for some time intrusted with signing all orders in his name. On his recovery the prince returned to Stetten, under the prince of Dessau fortifications. He was afterwards sent to Rheinsberg to see king Stanislaus, who was remarkable for his philosophy and confidence for his misfortunes. With him Frederick resided for some weeks, and contracted a friendship which was not dissolved but by death. Frederick was allowed to return to his peaceful residence at Rheinsberg, where he remained till the death of his father. In this place his time was spent alternately by the study of the arts and sciences and the pleasures of friendship. Philosophy, history, politics, the military art, poetry, agreeably succeeded each other, and he spent his time in a stated period. The prince passed the greater part of the day in his library; and the remainder of the day in the society of a select company of learned men. In these meetings, gaiety generally prevailed, but the generals to speak of war, musicians to play to the ear, and excellent painters to decorate the apartments. The morning was usually spent in study; agreeable conversation prevailed in the afternoon; and every evening there was a concert. In this retreat Frederick contracted an ardent passion for military glory, for which he became at last so remarkable; and here he formed the most sublime and daring projects, fired with a desire of imitating the heroes of antiquity, of whom he read in the works of ancient authors. He never spoke but with the assurance of the great warriors of Greece and Rome, and when seated on the throne, though not distinguished as an able soldier in a military manner, than by conferring on his subjects the surname. Hence he distinguished by the name of *Quintus Icilius*. M. Guichard, who had written some treatises on the military art of the ancients, gave him at the same time a free battle. In his pursuit of glory Frederick cultivated the friendship of celebrated poets, philosophers, and men; and commended, complimented, flattered all the most celebrated literati of that time. "The philosophers (says the author of his life) answered him as a mad lover to his mistress. They wrote to him that he was a great poet, a great philosopher, the greatest man of the north. All these hyperboles were too much for him, and Solomon was not sorry for it, though he had too much understanding to believe in the Rollin, Graveland, Maupertuis, Algarotti, were honoured with his correspondence. The last especially, accustomed to offer sacrifices to the idol of the day, were it transported from the dunghill to the altar, did not fail to call the first man of the universe a prince in the expectancy of the throne, and who at that time he was the greatest philosopher of

the poet in the world." That Frederick set up his character with the literati, or on a real predilection for his principles, and the *Apology of Wolf*, (a philosopher rather had banished, for writing a work disharmonious,) and had his principal inflated into French. He even prevailed on his father to relax a little in favour of the philosopher. In 1736, a letter was sent to Frederick, inviting him to return; but he ventured to make his appearance till his protector was seated on the throne, his residence at Rheinsberg, composed his refutation of the principles of Machiavel, under the title of *Anti-Machiavel*; he sent the MS. to Voltaire to correct, and printed. The old king, now worn with infirmity, saw with regret the predilection retained for men of letters; and, in his old age, often threatened the whole society of men in the fortress of Spandau. His frequent occasions a violent alarm to his joyous company at Rheinsberg, which all the eloquence of Frederick to quiet. His passions, however, were removed, in the old monarch died on the 31st of May, and left the throne to his son. The possession of a kingdom did not abate Frederick's love of literature, though to this he was now superadded the qualities and labours of a

His transactions in this character will be under the article Prussia; and therefore it remains to be said here, than to relate the events by which we may be able to trace the progress of this great and singular monarch. After his accession, gone into Prussia, he went to receive the homage of the provinces, he formed a resolution of proceeding as far as Paris. Being discovered at Paris, however, he laid aside his design, and went to see his states in Lower Germany. He wrote the celebrated Voltaire, that he would be *inognito* to visit him at Brussels; but he died with an indisposition in the little town of Cleves, two leagues from Cleves, he went to that philosopher, requesting him to make his first advances. The following curious anecdote given by him of his reception, &c. My guard I found at the gate was one of the privy counsellor, Rambonet, was dressed in the court: he had large ruffles on his coat; a hat full of holes; and an old peruke, one end of which descended to his pockets, and the other scarcely reached his shoulder. I was conducted into his apartment, where there was nothing remarkable. I perceived in a cabinet, by the side of a taper, a truckle bed, two feet long and wide, on which lay a little man in a night-gown of coarse blue cloth. The king, in a strong perspiration, and lying under a wretched blanket, in a state of the ague. I bowed to him; and feeling his pulse, as if I had been his physician. The fit over, he dressed himself and went to table. Algarotti, Kayserling, and the king's minister to the states of Prussia, were of the party; where

PART I.

we conversed profoundly on the immortality of the soul, on liberty, and the androgynes of Plato." This rigid economy, and contempt of every luxury, was maintained by Frederick as long as he lived. The following account, likewise from Voltaire, will give an idea of his manner of living. "He rose at 5 A. M. in summer, and 6 in winter. A lacquey came to light his fire, and dress and shave him; though indeed he almost wholly dressed himself. His room was not inelegant. A rich balustrade of silver, ornamented with little cupids, seemed to enclose an alcove bed, the curtains of which were visible; but behind them, instead of a bed, there was a library: the king slept on a truckle bed with a slight mattress concealed behind a screen. Marcus Aurelius and Julian, those apostles of Stoicism, did not sleep in a more homely manner. At 7 his prime minister arrived with a great bundle of papers under his arm. This prime minister was no other than a clerk, who had formerly been a soldier and valet-de-chambre. To him the secretaries sent all their dispatches, and he brought extracts of them, to which the king wrote answers in two words on the margin: and thus the affairs of the whole kingdom were expedited in an hour. At 11 the king put on his boots, reviewed his regiment of guards in the garden, and at the same hour the colonels were following his example in their respective provinces. The princes his brothers, the general officers, and one or two chamberlains, dined at his table; which was as good as it could be in a country where there is neither game, tolerable butcher's meat, nor a pullet, and where the very wheat is brought from Magdebourg. After the repast he retired alone into his cabinet where he made verses till 5 or 6 o'clock. Then came a young man named D'Arget, who read to him. A little concert began at 7, in which the king played on the flute with as much skill as the first performer; and pieces of his composition were frequently executed. Supper was served in a little hall, the most singular and striking ornament of which was a fine picture of Priapus. These repasts were not in general the less philosophic on that account. Never did men converse in any part of the world with so much liberty respecting all the superstitions of mankind, and never were they treated with more pleasantry and contempt. God was respected: but none of those who had deceived men in his name were spared. Neither women nor priests ever entered the palace. In a word, Frederick lived without a court, without counsel, and without religious worship." As Frederick had espoused his princess contrary to his inclination, it was imagined that on his accession, he would set himself free from engagements so disagreeable to himself. The queen impressed with suspicions of this kind, was on the point of fainting away when he made his first visit to her. To the surprise of all parties, however, he made her a very affectionate speech, apologizing for his indifference, and inviting her to participate with him the throne of which she was so worthy. In the 1st year of his reign, he restored the academy of sciences at Berlin; See ACADEMY, § XIII, N° 15. His war with the queen of Hungary, however, which took place almost immediately after his accession.

for some time prevented him from taking such an active part in literary matters as he was inclined to do. After the peace, he gave full scope to his passion for literature; and in the interval betwixt the conclusion of the first war and beginning of that of 1756, he composed most of his works; particularly his *History of my own Time*. Voltaire was his principal literary correspondent, whom he invited to reside with him. Afraid of losing his liberty, that philosopher hesitated, excused himself, and entered into pecuniary treaties. At last he was determined by seeing a poem from Frederick to M. D'Arnaud, in which the latter was compared to the rising, and Voltaire to the setting, sun. By this Voltaire was so much piqued, that he set out for Berlin without delay, and arrived there in June 1750. He was received in the most magnificent and affectionate manner, and for some time his situation was very agreeable; but the disputes and rivalry which took place betwixt him and Maupertuis soon threw every thing into confusion. In these the king interfered in such a manner as was certainly below his dignity; and he often exercised himself in making a jest of the other men of letters, in a way which induced many of them to leave him. The squabbles with Voltaire were sometimes very diverting; See VOLTAIRE. They ended at last in a final quarrel with that wit, and his departure from the kingdom. The restless disposition of Frederick showed itself after his departure, by his attempts to provoke the literati who remained at his court, to quarrel with him as Voltaire had done. But they were of too passive a disposition to gratify him in this respect, choosing rather to suffer the most mortifying strokes of raillery, or to leave the kingdom, than to contend with him. This proved so uneasy to the king, that he one day exclaimed, "Shall we have no more quarrels then?" The breaking out of the war in 1756, however, put a stop to this diversion, and afforded him as many enemies as he could wish. The exploits he performed, during the 7 years which this unequal contest lasted, are almost incredible; (See PRUSSIA;) and it is amazing how the fortitude and resolution of any man could enable him to sustain the difficulties which during this period he encountered. Once however even the resolution of Frederick was on the point of giving way. After the battle of Colin, when his affairs seemed altogether desperate, he wrote to his sister at Bareith, that he was on the point of putting an end to his own life. And as he wished to have it said that he made verses even on the brink of the grave, he wrote a long poetical epistle to the marquis d'Argens, in which he communicated to him his design, and bade him farewell. His affairs, however, took a better turn, and such desperate thoughts were laid aside. But his constitution was irreparably injured by the excessive fatigues he had sustained. Soon after the peace, his body began to bend, and his head to incline to the right side: by degrees he became very infirm; he was tormented with the gout, and subject to frequent indigestions. All his distempers, however, were born with invincible patience; and, till a very short time before his death, he never ceased to attend his reviews, or visit the provinces. He has

been known to review his troops, and go through all the ranks, as if he felt no pain, with an abscess, which approached to a suppuration, touched the saddle. In Aug. 1785, he improved his health still farther by assisting at a review, where he was exposed without a cloak to a heavy rain for 4 or 5 hours. On his return to Potsdam he was seized with a fever; and, for the first time, became unable to assist at the military exercises. His malady, however, did not prevent him from dictating the disposition of these exercises during the 3 days they lasted. About the end of August the fever left him, but was succeeded by a violent cough; by which he was greatly weakened, and prevented from sleeping; but this did not interrupt either the execution of business, or the routine of his literary exertions; wherein he continued to employ himself till the day he died. On the 17th and 18th of May 1786, he was unable to assist at the ordinary reviews. At last his disorder terminated in a dropsy. He was now no longer able to remain in bed, he sat up day and night in an arm-chair with springs, which could be moved at pleasure. For near a month before his death the swelling of his feet gave him violent pain, so that he wished an incision to be made; but the surgeon refused to perform the operation, suspecting that it might hasten his death. Nature, however, accomplished his cure: his right leg opened, and discharged such a quantity of matter, that he was greatly relieved. On the 16th Aug. 1786, his throat began to swell violently; and he soon after fell into a coma, though from this he recovered so far as to be able to speak. His respiration and voice became gradually more feeble; and he expired on the evening of the 17th, at 19 minutes after 2, in the 75th year of his age, and 47th of his reign. This great monarch was of the middle size, with large blue eyes and a piercing look. He spoke German incorrectly, and in a very rough manner, but talked French very fluently and agreeably. His constitution was naturally feeble, but he greatly improved it by his laborious life. He was the art of relieving every one from that embarrasment, which is apt to occur in accosting a monarch. His universal knowledge enabled him to converse on all subjects. He talked of war with the soldier, of verses with the poet, of agriculture with the farmer, of jurisprudence with the lawyer, of commerce with the merchant, and of politics with the Englishman. He had a very retentive memory; was fond of solitude and gardening, and took great pleasure in dogs, of which animals he constantly kept a number about him, giving them little balls to play with. In company, he was fond of asking questions and jesting; in which at last proceeded such lengths as undoubtably were unbecoming in a superior towards his subjects. In military affairs he was excessively severe, not to say cruel; of which the following anecdote may serve as an instance. In the first war of Frederick with Russia, wishing to make some alteration in his army during the night, he forbade every person, under pain of death, to keep, after a certain hour, any light in his tent. He himself was in the rounds; and in passing the tent of a captain, he perceived a light. Entering the tent,

tain sealing a letter to his wife, for a great affection. "What are you (says he ;) Do you know the order?" fell on his knees and asked pardon. (says Frederick), and add a few words to dictate to you." Zittern obeyed; dictated, "To morrow I shall die." The unfortunate man wrote them, was executed. His cruel treatment ENCK is well known. In matters of justice, he was more arbitrary than we have a notable example in the of Arnold the miller. This man had by the rent of his mill, on pretence in which turned it had been diverted and. But as the water which ran in also ran out of it into the same channel, the miller evidently suffered no damage, judges therefore gave sentence against him, not only reversed their sentence of them. For this he was celebrated in the newspapers in Europe; and yet he was wrong, and afterwards even acknowledged to have been so: but notwithstanding he not only made no reparation to the king, but allowed them to lie in prison. He entertained most unaccountable prejudices against certain places and persons, and his conduct nor merit could eradicate. One of the most unfortunate places was Westphalia, never conferred any bounty; and one of that country, a man of great merit, proposed to him for a place, he refused, because he is a Westphalian; he is good for nothing. Voltaire justly accuses him of ingratitude. Count de Seckendorf; who saved his life, whom he conceived the most indebted. His neglect of others who afforded him the most essential service, was shameful. A robust butcher prevented him from falling, and all, over a precipice, where both undoubtedly have been killed, the king on the spot and saying, *Thank you friend*, rode away, never enquiring farther about his preceptor. With regard to his literary merits, he was not without having corrected his works, and having furnished him with materials for writing. He has been accused of stealing scraps of poetry from Voltaire, Boileau, and others; nor does the charge seem well founded. Such of his verses, as have undergone correction, are very indifferent. But let us mention the foibles of Frederick, it will record his acts of virtue. Upon his death he created his mother with great respect, she should bear the title of *Queen Mother* instead of addressing him as *His Majesty*. He should call him *son*. As he was passing between Berlin and Potsdam, a thousand men had been marked out for military service surrounded his coach, and cried out "deliver us from our slavery." He granted them their liberty, and next day ordered the soldiers to be taken off. He granted a general pardon of religion, and among other things he con- veyed the profession of free masonry. This monarch was illustrious, as well

for the variety of characters he sustained, as for the important vicissitudes he experienced. But the pacification of Dresden, in 1745, enabled him to appear in a character far more glorious than that of the conqueror of Silesia. He was now entitled to the noblest eulogy, as the wise legislator of his country. Exclusive of his general attention to agriculture, commerce, and manufactures, he peopled, in particular, the deserts of Pomerania, by encouraging, with royal bounties, a great number of industrious emigrants to settle in that province; the face of which, in a very few years, underwent the most agreeable alteration. Above 60 new villages arose amidst a barren waste; and every part of the country exhibited marks of successful cultivation. Those desolate plains, where not a footstep had been seen for ages, were now converted into fields of corn; and the happy peasants, under the protection of a patriot king, sowed their grounds in peace, and reaped their harvests in security.

iii. FREDERICK V. king of Denmark, reigned 20 years, and on his death bed, expressed his satisfaction to his son Christian VII, in a circumstance, which few monarchs can boast who have reigned so long. "It is a great consolation to me my son, (said he) in my last moments, that I have not injured any person, and that my hands are not stained with one drop of blood." See DENMARK.

(XII.) FREDERICK, Colonel, the son of Theobald, king of Corsica, by an Irish lady of the noble family of Lucan, was born in Spain, and had a liberal education, and was also well qualified for the military line. He came to England in 1754, and taught the Italian language for some years. He afterwards went to the continent where he obtained the rank of Colonel, and the cross of merit, from the late duke of Wurtemberg: for whom he acted as agent, upon his return, and disposed of a regiment to the E. India Company. He married a German lady, while abroad, by whom he had a son, who fell in the American war, and a daughter. His finances falling low at last, he shot himself, at Westminster Abbey, on the 1st Feb. 1796. He was a man of general knowledge, and considerable talents. He wrote, 1. *Memoires pour servir l'histoire de Corse*, 8vo, 1768. 2. The description of Corsica; with an account of its union to the crown of Great Britain, 8vo, &c. 1796.

(XIII.) FREDERICK, in geography, the name of two counties, 2 towns, and a fort, in the United States; viz.

1. FREDERICK, a county of Maryland, bounded on the N. by Pennsylvania, E. by Baltimore, SW. by the Potomac, and W. by Washington; extending 30 miles every way. There are 37 mills, an iron and glass manufactory in it. It had 27,159 citizens, and 3,641 slaves in 1795. Fredericktown is the capital.

2. FREDERICK, a county of Virginia, bounded on the N. by Berkley, E. and S. by the Shannandoah, and W. by Hampshire; 30 miles long, and 20 broad. It contained 15,431 citizens, and 4,230 slaves, in 1795. It abounds with lime-stones and iron ore; iron works have been erected which produce from 800 to 1000 tons of iron annually. Winchester is the chief town.

3. **FREDERICK**, a fort of Maryland, in Washington county, on the Potomac, near Pennsylvania.

4. **FREDERICK**, a town of Maryland, in Cecil county, on the Sassafras, 6 miles SW. of Warwick. Lat. 39. 22. 30. N.

5. **FREDERICK**, a township of Pennsylvania, in Montgomery county.

6. **FREDERICK**, a town of New Brunswick, on the N. side of St John's river. Lon. 66. 45. W. Lat. 46. 3. N.

FREDERICK-AUGUSTUS I, king of Poland, the son of John George III. elector of Saxony, was born at Dresden in 1670, and succeeded his father in 1694. He made several campaigns against the French and Turks; and having embraced the Roman Catholic religion, he was elected king of Poland, in 1697. But having joined with Peter the Great, and Frederick IV, of Denmark, against Charles XII. of Sweden, tho' at first very successful, he was at last constrained to sign a treaty in 1706, resigning his crown to Stanislaus Leczinski. See SWEDEN. After the battle of Pultowa, however, he was restored to his throne. See POLAND. He died in 1733. He was endued with great personal strength, and undaunted courage.

FREDERICK-AUGUSTUS II, king of Poland, the son of the preceding monarch, was born in 1696, and elected in 1734. The latter years of his reign were very unfortunate. In 1756, the king of Prussia invaded Saxony, and retained it till the peace of 1763. Frederick Augustus died Oct. 5th 1763. See POLAND.

FREDERICKENBURG, a town of Upper Saxony, in Anhalt Zerbst, 1 mile SW. of Zerbst.

FREDERICK-LEWIS, Prince of Wales, the eldest son of K. George II, and father of his present Majesty, was born, Jan. 31st, 1707. He came over to England in Dec. 1728; married Princess Augusta of Saxe-Gotha, May 1736, by whom he had 9 children; and died March 31st, 1751, very much regretted, being a prince of an excellent character and disposition. See ENGLAND, § 81.

FREDERICK-NAGORE, a town of Bengal, belonging to Denmark, 18 miles above Calcutta, and $7\frac{1}{2}$ below Chandernagore. See BENGAL, N° 1, § 10.

(1.) **FREDERICKSBURG**, a castle and palace of the king of Denmark, in the isle of Zealand, 15 miles NW. of Copenhagen. Lon. 12. 25. E. Lat. 55. 52. N.

(2.) **FREDERICKSBURG**, a fort on the Gold Coast of Guinea, in Africa, near Cape Threepoints, 62 miles from Cape Coast Castle. It is subject to Denmark. Lon. 1. 5. W. Lat. 4. 30. N.

(3.) **FREDERICKSBURG**, a town of Upper Saxony, in Pomerania, formerly called Quarckenburg, 30 miles SSW. of Colberg.

(4.) **FREDERICKSBURG**, a town of Virginia, in Spotsylvania county, on the SW. bank of the Rappahannock, 110 miles from its mouth. It contains about 200 houses; the chief street runs parallel with the river. It had 1413 citizens and 587 slaves in 1790. It is 50 miles SSW. of Alexandria. Lon. 77. 16. W. Lat. 38. 22. N.

FREDERICKSHALL, a town of Norway in the province of Aggerhuys, on the frontiers of Sweden, and on the extremity of the Swinesund,

at the mouth of the Tiste. The harb and commodious; but the saw-dust bro the river from the mills occasions an pence to clear it. It contains 3000 in and lies 31 miles SE. of Christiania, and Uddevalla. Lon. 10. 55. E. Lat. 59. 2

FREDERICKSHOLM, a fort of 10 miles S. of Christiansand.

FREDERICKSODE, a town of De Jutland, taken by the Swedes in 1657, subject to Denmark. It is seated near 1 m. N. of Sleswick. Lon. 10. 0. E. Lat.

FREDERICKS-SUND, a sea port of in the isle of Zealand, 10 miles NW. hagen. Lon. 12. 13. E. Lat. 55. 50. N.

(1.) **FREDERICKSTADT**, a town mark, in S. Jutland, built in 1621. It on the river Eyder, 17 miles WSW. of Lon. 9. 10. E. Lat. 54. 26. N.

(2.) **FREDERICKSTADT**, a town of N the prov. of Aggerhuys, seated on the 26 miles W. of Frederickshall. Lon. Lat. 59. 2. N.

FREDERICKSTEIN, a strong fort way, on the summit of a rock, which **FREDERICKSHALL**; famous for the Charles XII. killed while besieging it, i

(1.) **FREDERICKSTOWN**, a town of York, in Dutchess county; which contains 63 slaves in 1795.

(2.) **FREDERICKSTOWN**, a town of the county of Tyrone, and province of

FREDERICKSVORN, a town of N the prov. of Aggerhuys 3 miles S. of L

FREDERICKSWERK, a seaport of on the N. coast of Zealand, where foundery for cannons, &c.

FREDERICKTON, a township of N wick, 90 miles up St John's river.

FREDERICKTOWN, a flourishing Maryland, capital of Frederick county, Carroll's creek, containing 700 houses for Presbyterians, German Lutherans, and Baptists, a court-house, &c. It is by N. of Baltimore, and 148 SW. of Pl Lon. 77. 30. W. Lat. 39. 24. N.

(1.) **FREDERICK WILLIAM**, the Gr tor of Brandenburg, was born Feb. 6th. succeeded his father William George, it was declared the first sovereign duke of 1658, and died in 1688. See PRUSSIA.

(2.) **FREDERICK WILLIAM I**, K. the son of Frederick I. and grandson t ceding, was born Aug. 4th, 1688, and su father in 1713. He was a man of nar violent passions, and of an arbitrary His chief pride was to be master of th giment in Europe. See PRUSSIA. 1740, and was succeeded by his son Fr Great.

(3.) **FREDERICK-WILLIAM II**, late sia, and grandson to the preceding mo born Sept. 25th 1744, and succeeded hi derick the Great, in 1786. He was first promoters of the present war w and the first who deserted the coalition peace with the French republic. Se

tion. He died in 1797, and was his son Frederick-William III.

EE. adj. [*fresh*, Sax. *vy*, Dutch.] ; not a vassal ; not enslaved ; not a dependant.—A *free* nation is that never been conquered, or thereby any conditions of subjection. *Temple*.—What? and fetter'd with so many chains?

Dryden.
We think any one *freer* than to have do what he will? *Locke*.—

etch'd body trembles at your power : could fortune ; but she can no more : feel my potent mind remains, the victor's rage, nor feels his chains.

Prior.
Unhappy pris'ner *free*, intended harm to thee. *Prior*.

ed ; unrestrained.—Their use of it like unto our ceremonies, that be of private action in common life, man was *free* to order that which him—this is a publick constitution for the church. *Hooker*.—

ful homage, and receive *free* honours, we pine for now. *Shak. Macbeth*.
; and in my choice whether or no I in these discourses : yet the publick ice resolved, the dedication was not. *South*. 3. Not bound by fate ; not

hey stood who stood, and fell who fell : that proof could they have giv'n sincere legiance, constant faith, or love, y what they needs must do, appear'd ; they would ? *Milt. Par. Lost*.
; allowed.—

ir, I pray, are not the streets as *free* for you ? *Shak. Taming of the Shrew*.
ing as impure what God declares commands to some, leaves *free* to all.

Milton.
my cares my thoughts alone are *free*. sports with troubled thoughts agree, *Pope*.

s ; unrestrained.—
O conspiracy !

ou to shew thy dang'rous brow by
s are most *free* ? *Shak. Julius Caesar*.

are too *free* upon the subject, in the of their friends. *Temple*.—The cri-

ten very *free* in their censures. *Felton*.
there are to whose presumptuous ghts
r beauties, ev'n in them seem faults.

Pope.
ingenuous ; frank.—

, I have doubts within my heart ;
be *free* and candid to your friend ?
Otway's Orphan.

ed ; conversing without reserve.—
'Tis not to make me jealous ;
wife is fair, feeds well, loves company,
peech, sings, plays, and dances well,
tue is, these make more virtuous.

Shak. Othello.

—Being one day very *free* at a great-feast, he suddenly broke forth into a great laughter. *Hakewill*.

Free and familiar with misfortune grow,
Be us'd to sorrow, and inur'd to woe. *Prior*.
8. Liberal ; not parsimonious : with *of*.—

Glo'ster too, a foe to citizens,
O'ercharging your *free* purses with large fines,
That seeks to overthrow religion. *Henry IV*.

No statute in his favour says,
How *free* or frugal I shall pass my days ;
I, who at sometimes spend as others spare. *Hor*.

—Alexandrian verses, of twelve syllables, should never be allowed but when some remarkable beauty or propriety in them atones for the liberty : Mr Dryden has been too *free* of these in his latter works. *Pope*.

9. Frank ; not gained by importunity ; not purchased.—We wanted words to express our thanks : his noble *free* offers left us nothing to ask. *Bacon's New Atlantis*. 10. Clear from distress.—

Who alone suffers, suffers most i' th' mind,
Leaving *free* things and happy shows behind,
Shak. King Lear.

11. Guiltless ; innocent.—
Make mad the guilty and appal the *free*,
Confound the ignorant. *Shak. Hamlet*.

My hands are guilty, but my heart is *free*.
Dryden.

12. Exempt ; with *of* anciently ; more properly *from*.

These
Are such allow'd infirmities, that honesty
Is never *free* *of*. *Shak. Winter's Tale*.

Who fears not to do ill, yet fears the name ;
And *free* from conscience, is a slave to fame.
Denham.

Let envy, then, those crimes within you see,
From which the happy never must be *free*.
Dryden.

Their steeds around,
Free from the harness, graze the flow'ry ground.
Dryden.

—The will, *free* from the determination of such desires, is let to the pursuit of nearer satisfactions. *Locke*. 13. Invested with franchises ; possessing any thing without vassalage ; admitted to the privileges of any body : with *of*.—

He therefore makes all birds of every sect
Free of his farm, with promise to respect
Their several kinds alike, and equally protect.
Dryden.

What do'st thou make a shipboard ? To what end
Art thou *of* Bethlem's noble college *free* ?
Stark-staring mad, that thou should'st tempt the sea ?
Dryden.

14. Without expence ; by charity, as a *free-school*.
(2.) **FREE OR IMPERIAL CITIES** in Germany, are those not subject to any particular prince ; but governed, like republics, by their own magistrates. There were free cities (*liberae civitates*) even under the ancient Roman empire : such were those to whom the emperor, by the advice or consent of the senate, gave the privilege of appointing their own magistrates, and governing themselves by their own laws. See **CITY**, § 2.

(3.) **FREE FISHERY**. See **FISHERY**, § 4.

(4.) **FREE**

(4.) **FREE MASON.** See **MASON.**

(5.) **FREE WARREN.** See **WARREN**, § 2.

* **To FREE.** *v. a.* [from the adjective.] 1. To set at liberty; to rescue from slavery or captivity; to manumit; to loose.—

The child was prisoner to the womb, and is
By law and process of great nature thence
Free'd and enfranchis'd; not a party to
The anger of the king, nor guilty of,
If any be, the trespass of the queen. *Shak.*
—He recovered the temple, *free'd* the city, and
upheld the laws which were going down. 2 *Mac.*
ii. 22.—

Can'st thou no other master understand,
Than him that *free'd* thee by the pretor's wand?
Dryden.

Should thy coward tongue
Spread its cold poison through the martial throng,
My jav'lin shall revenge so base a part,
And *free* the soul that quivers in thy heart. *Pope.*
2. To rid from; to clear from any thing ill: with
of or *from*.—It is no marvel, that he could think
of no better way to be *free'd of* these inconveni-
encies the passions of those meetings gave him, than
to dissolve them. *Clarendon.*—

Hercules

Free'd Erymanthus from the foaming boar. *Dryd.*
Our land is from the rage of tygers *free'd*.
Dryden.

3. To clear from impediments or obstructions.—
The chaste Sibylla shall your steps convey,
And blood of offer'd victims *free* the way.
Dryden.

Fierce was the fight; but hastening to his prey,
By force the furious lover *free'd* his way. *Dryd.*
This master-key

Frees every lock, and leads us to his person.
Dryden.

4. To banish; to send away; to rid. Not in use.
We may again

Give to our tables meat, sleep to our nights,
Free from our feasts and banquets bloody knives.
Shak.

Never any sabbath of release
Could *free* his travels and afflictions deep. *Daniel.*
5. To exempt.—For he that is dead is *free'd* from
sin. *Rom.* vi. 7.

FREE-BENCH, signifies that estate in copyhold
which the wife, being espoused a virgin, has af-
ter the decease of her husband for her dower, ac-
cording to the custom of the manor. In regard to
this free-bench, different manors have different
customs. In the manor of E. and W. Enbourne
in Berkshire, and other parts of England, there is
a custom, that when a copyhold tenant dies, the
widow shall have her free-bench in all the decea-
sed husband's lands, *dum sola & casta fuerit*,
“whilst she lives single and chaste;” but if she
shall be guilty of incontinency, she shall forfeit her
estate. Nevertheless, upon her coming into the
court of the manor riding backwards on a black
ram, with his tail in her hand, rehearsing a ridi-
culous and indelicate form of words in doggerel
rhymes, characteristic of the times in which they
were composed, the steward is bound by custom
to restore her to her free-bench.

(1.) * **FREEBOOTER.** *n. f.* [*free* and *booty*.]
A robber; a plunderer; a pillager.—Perkin was

not followed by any English of name, his
consisted mostly of base people and *free*
fitter to spoil a coast than to recover a k
Bacon.—The earl of Warwick had, as oft
met with any Irish frigates, or such *freebo*
sailed under their commission, taken all
open. *Clarendon.*

(2.) **FREEBOOTER**, or **FLIBUSTER**, was
nally a name given to the pirates who sco
American Seas, and made war against t
niards. See **BUCCANIER**.

* **FREEBOOTING.** *n. f.* Robbery; plun-
act of pillaging.—Under it he may cleanly
any fit pillage, that cometh handsomely in
and when he goeth abroad in the night
booting, it is his best and surest friend. *Sp*

* **FREEBORN.** *n. f.* [*free* and *born*.] Not
inheriting liberty.—

O baseness, to support a tyrant's th
And crush your *freeborn* brethren of th

—I shall speak my thoughts like a *freeb*
ject, such things perhaps as no Dutch co
tor could, and I am sure no Frenchma
Dryden's Æn. Ded.—

Shall *freeborn* men, in humble awe,
Submit to servile shame,

Who from consent and custom draw
The same right to be rul'd by law,
Which kings pretend to reign?

FREEBURG, a town in Yorkshire.

* **FREECHAPEL.** *n. f.* [*free* and *chape*
chapels as are of the king's foundation,
him exempted from the jurisdiction of th
ry. The king may also license a subject
such a chapel, and by his charter exempt
the ordinary's visitation. *Cowel.*

* **FREECOST.** *n. f.* [*free* and *cost*.]
expence; free from charges.—We must n
any man for an exact master in the rule
modern policy, but such a one as has
himself so far to hate and despise the ab
being kind upon *freecost*, as not so much
a friend what it is o'clock for nothing. *S*

(1.) * **FREEDMAN.** *n. f.* [*free* and
slave manumitted. *Libertus*.—

The *freedman* jostles, and will be p
First come, first serv'd, he cries. *D*

(2.) **FREEDMAN.** See **LIBERTUS**.

(1.) * **FREEDOM.** *n. f.* [from *free*.]
ty; exemption from servitude; indepen
The laws themselves they do specially
as most repugnant to their liberty and
freedom. *Spenser on Ireland.*—

2. Privileges; franchises; immunities.—

By our holy sabbath have I sworn
To have the due and forfeit of my bo
If you deny it, let the danger light
Upon your charter, and your city's f

3. Power of enjoying franchises.—This p

as to servants, so as to become citizens
privileges with the rest, which very much
the power of the people. *Swift*. 4. Ex-
rom fate, necessity or predetermination.

I else must change
ature, and revoke the high decree
geable, eternal, which ordain'd
freedom; they themselves ordain'd their
Milton.

fin, by how much the more free will
oice, by so much is the act the more
d where there is nothing to importune,
rove the will to any act, there is so
higher and perfecter degree of freedom
act. *South*. 5. Unrestraint.—I will that
its and sabbaths shall be all days of free-
e Jews in my realm. 1 *Mac*. 2. 6. The
ring without any particular evil or in-
ce.—The freedom of their state lays them
reater necessity of always chusing and
best things. *Law*. 7. Ease or facility
or showing any thing.

EDOM, (§ 1. *def*. 1.) See LIBERTY.

EDOM OF A CORPORATION, (§ 1. *def*.
CORPORATION, § III, VII. The free-
ties, and other corporations, is regularly
by serving an apprenticeship; but it is
hased with money, and sometimes con-
way of compliment.

EDOM OF CONSCIENCE. See TOL-

EDOM OF THE WILL, (§ 1. *def*. 4.)
or faculty of the mind, whereby it is
acting or not acting, choosng or reject-
ing it judges proper. Of this every man
is sensible, who finds in himself a power to
forbear, continue or end several actions,
as a thought or preference of the mind.
APHYSICS.

FREEFOOTED. *adj*. [*free* and *foot*.] Not
in the march.—

We will fetters put upon this fear,
now goes too freefooted. *Shak*. *Hamlet*.
FREEHEARTED. *adj*. [*free* and *heart*.] Li-
unrestrained.—

must freehearted be, and voluntary;
not enchanted, or by fate constrain'd.

Davies.
FREEHOLD. *n. f*. [*free* and *bold*.] That
tenement which a man holdeth in fee,
or for term of life. *Freehold* indeed is the
possession of lands or tenements in fee, fee-
or life. *Freehold* in law is the right that
is to such land or tenements before his
seizure. *Freehold* is sometimes taken in
as to villenage. Land, in the time of the
was called either blockland, that is, holden
or writing, or foreland, that is, holden
writing. The former was held by far
conditions, and by the better sort of ten-
noble men and gentlemen, being such as
call *freehold*. The latter was commonly
possession of clowns, being that which we
at the will of the lord. *Cowel*.—No alie-
lands holden in chief should be available,
the *freehold* or inheritance thereof, but
ere it were made by matter of record.
Office of Alienation.—There is an unspeak-

able pleasure in calling any thing one's own: a
freehold, though it be but in ice and snow, will
make the owner pleased in the possession, and
stout in the defence of it. *Addison*.—My friends
here are very few, and fixed to the *freehold*, from
whence nothing but death will remove them. *Swift*.
—I should be glad to possess a *freehold* that could
not be taken from me by any law to which I did
not give consent. *Swift*.

(2.) FREEHOLD, or FRANK TENEMENT; *liberum
tenementum*. See FEE and TAIL.

(3.) A FREEHOLD, by the common law, cannot
commence *in futuro*; but it must take effect pre-
sently, either in possession, reversion, or remain-
der. Whatever is part of the freehold goes to the
heir; and things fixed thereto may not be taken
in distress for rent, or in execution, &c. No man
shall be disseised of his freehold by stat. *Magna
Charta*, cap. 29. but by judgment of his peers, or
according to the laws of the land: nor shall any
distrain freeholders to answer for their freehold, in
any thing concerning the same, without the king's
writ. Freehold estates, of certain value, are re-
quired by statutes to qualify jurors, electors of the
knights of the shire in parliament, &c.

(4.) FREEHOLD, in geography, a town of New
Jersey, in Monmouth county, 15 miles W. of
Shrewsbury, 20 SE. by S. of New Brunswick,
and 44 NE. of Philadelphia. It has an academy,
and contained 3,158 citizens, and 627 slaves in
1795. A bloody battle was fought here between
the British under Sir H. Clinton, and the Ameri-
cans under Gen. Washington on the 28th June,
1778. See AMERICA, § 30.

(5.) FREEHOLD, a township of New York, in
Albany county, containing 1817 citizens, of whom
562 were electors; and 5 slaves, in 1795.

(1.) * FREEHOLDER. *n. f*. [from *freehold*.]
One who has a freehold.—As extortion did banish
the old English *freeholder*, who could not live but
under the law; so the law did banish the Irish
lord, who could not live but by extortion. *Davies*.

(2.) FREEHOLDERS, in the ancient laws of Scot-
land, are called *milites*, knights. In *Reg. Judicia*.
it is expressed, that he who holds land upon an
execution of a statute merchant, until he hath sa-
tisfied the debt, *tenet ut liberum tenementum sibi et
assignatis suis*; and the same of a tenant *per elegit*:
the meaning of which seems to be, not that such
tenants are freeholders, but as freeholders for the
time, till they have received profits to the value
of their debt.

* FREELY. *adv*. [from *free*.] 1. At liberty;
without vassalage; without slavery; without de-
pendance. 2. Without restraint; heartily; with
full gust.—If my son were my husband, I would
freelier rejoice in that absence wherein he won
honour, than in the embracements of his bed,
where he would shew most love. *Shakesp*. *Coriol*.
3. Plentifully; lavishly.—

I pledge your grace; and if you knew what
pains

I have bestow'd to breed this present peace,
You would drink *freely*. *Shak*. *Henry IV*.

4. Without scruple; without reserve.—

Let such teach others who themselves excel,
And censure *freely* who have written well. *Pope*.

5. Without impediment.—I'll follow rather the
Clothes

Goths in rhyming, than the Greeks in true versifying, were even to eat acorns with swine, when we may *freely* eat wheat-bread among men. *Ascham*.

The path to peace is virtue: what I show,
Thyself may *freely* on thyself bestow:
Fortune was never worshipp'd by the wise;
But set aloft by fools, usurps the skies. *Juv.*
6. Without necessity; without predetermination.
Freely they stood who stood, and fell who fell.
Milton.

—He leaves us to chuse with the liberty of reasonable beings; they who comply with his grace, comply with it *freely*; and they who reject it, do also *freely* reject it. *Rogers*. 7. Frankly; liberally; without cost.—By nature all things have an equally common use: nature *freely* and indifferently opens the bosoms of the universe to all mankind. *South*. 8. Spontaneously; of its own accord.

(1.) * FREEMAN. *n. s.* [*free* and *man*.] 1. One not a slave; not a vassal.—Had you rather Cæsar were living, and die all slaves, than that Cæsar were dead, to live all *freemen*? *Shakesp.*—If to break loose from the conduct of reason, and to want that restraint of examination and judgment which keeps us from chusing or doing the worst, be liberty, true liberty, madmen and fools are only the *freemen*. *Locke*. 2. One partaking of rights, privileges, or immunities.—

He made us *freemen* of the continent,
What nature did like captives treat before.

Dryden.

—What this union was is expressed in the preceding verse, by their both having been made *freemen* on the same day. *Addison on Italy*.

(2.) FREEMAN, Susannah, afterwards Mrs CARROL and Mrs CENTLIVRE, a celebrated comic writer, daughter of Mr Freeman of Holbeach, in Lincolnshire. She had such an early turn for poetry, that it is said she wrote a song before she was 7 years old. Before she was 12, she could not only read Moliere in French, but enter into the spirit of all the characters. Her father dying, left her to the care of a step-mother, whose treatment being harsh, she determined, though almost destitute of every necessary, to go up to London to seek a better fortune. As she was proceeding on foot, she was met by the noted libertine, Anthony Hammond, Esq. who was so struck with her beauty, that he instantly fell in love with her; and inquiring into her story, soon prevailed upon her unexperienced innocence to go with him to Cambridge. After some months cohabitation, he persuaded her to come to London; where, in a short time, she was married to a nephew of Sir Stephen Fox. But he dying about a year after, her wit and beauty soon procured her a 2d husband, one Carrol, an officer in the army; but he being killed in a duel about 18 months after, she became a votary of the Muses, and under this name of Carrol, some of her earlier pieces were published. Her first attempt was a tragedy, the *Perjured Husband*; but her natural vivacity leading her to comedy, we find but one more attempt in the buskin, among 18 dramatic pieces which she afterwards wrote. In 1706, Mr Joseph Centlivre, principal cook to Q. Anne, married her; and, after passing several years happily together, she died at his house in Spring Garden, in Dec. 1723. She for

many years enjoyed the intimacy and the most eminent wits of the times, viz. and Steele, Rowe, Budgell, Farquhar, &c. and few authors received more esteem and patronage from the great. She does not abound with wit, and the language is times poor; but her plots are well conceived, and her characters natural.

FREE-MARTIN. See HERMAPHRODITE.
* FREEMINDED. *adj.* [*free* and *mind*.] perplexed; without load of care.—*I am freeminded*, and cheerfully disposed at home, sleep, and exercise, is one of the best long lasting. *Bacon*.

* FREENESS. *n. s.* [*from free*.] 1. Freedom or quality of being free.—2. Openness; candour; ingenuousness; candour.—*I may pardon it, if he please, for the freeness of his confession*. *Dryden*. 3. Generosity; liberality.—*I hope it will never be said that the laity or the clergy are taught to be charitable, if the corporations exceed the clergy itself, in freeness of giving*. *Spratt*.

FREEPORT, a township of the Union in Maine district, and Cumberland county, situated at the head of Casco Bay, 10 miles from Portland, and 140 of Boston. It contained 1795 citizens in 1795.

* FREESCHOOL. *n. s.* [*free* and *school*.] a school in which learning is given without fee.—*To give a civil education to the youth in the time to come, provision was made by law, that there should be one school at least erected in every diocese*. *Davies*.—*Some gentlemen stood candidates for a small fellowship, who happened to have a better standing than his neighbours, procured for him who was the better scholar*. *Spratt*.

* FREESPOKEN. *adj.* [*free* and *spoken*.] accustomed to speak without reserve.—*I might have supped privately with some six or seven amongst whom there was one that was a very serious man, and began to take the liberty of Marcellus and Regulus had done: he fell into discourse of the injustice and the folly of the former time, and, by name, of the fathers; and said, what should we do with them if we had them now? One of them, who was a freespoken senator, said, they should sup with us*. *Bacon*.

(1.) * FREESTONE. *n. s.* [*free* and *stone*.] commonly used in building.—*Freestone* is a stone of such a constitution as is wrought and cut freely in any direction.—*I saw her hand; she has a leathern hand, like stone coloured hand*. *Shakesp.* *As you lie*—*streets are generally paved with brick, and always kept very neat*. *Addison on*

(2.) FREE-STONE is a whitish stone, which is many parts of Britain, that works like marble, but is more hard and durable; being used in building, &c. It is a species of limestone, but finer grained and smoother. The qualities of the several kinds of free-stones are different, and in different parts of Europe vary much. They all agree in this general property, indeed, that they are softer while in the quarry, than after they have been some time exposed to the air.

nal property differs greatly in degree. A sort of grey freestone in use at Paris we have not yet met with any in this which has the above-mentioned quality to a degree, that the expence of working great measure saved. This stone lies on the southside of the river Seine, and is of a fine and large grit. It is so soft when taken out of the strata, that they fashion it readily with a sort of broad axe, and many stones for building in this manner, as an equal number of our people do or two. Though this stone is as soft as when first taken up, it is found to harden rapidly in the air, that it becomes more so to our ordinary free-stone. The Portland is of the finest kind, which is white, and of a fine grit, is very fit for hewing and carving; it neither resist water nor fire, which is a rare instance in so dense a stone; while one of Kent, which is less beautiful to the eye, and is of a greyish colour, and coarser, though of a larger grain, resists the air very well. The free-stone of Derby, on the other hand, is so brittle as to be unfit for working; and so coarse and open, that it lets water through: yet it is extremely well, and is fit for ovens, &c.

FREETHINKER. *n. s.* [*free* and *think*.] One who is a contemner of religion.—Atheist is a more proper word: I'm a *freethinker*, child.—Of what use is freedom of thought, if it does not produce freedom of action, which is now remote forever in appearance, of what use is Christianity? And therefore we should consider it as an edifice, wherein we have such a mutual dependance on each other, that if you pull out one single stone, the whole must fall to the ground. See *DEISM*.

FRETHAM. See *DEISM*, and *DEISM*. **FRETHAM,** a village S.W. of Yarmouth. **FRIDWYN,** a town of Massachusetts, in New England, 30 miles S. of Boston, containing 1000, in 1795.

FRIDWYN. *n. s.* [*free* and *will*.] 1. The directing our own actions without necessity or fate.—We have a power to be the execution of this or that desire: we are the source of all liberty; in this consists that which is improperly called *Liberty*. 2. Voluntariness; spontaneity. A desire, that all they of the people of Jerusalem, which are minded of their hearts to go up to Jerusalem, go with thee. *Acts* 13.

FRIDWYN ISLAND, an island in the East India Sea. Long. 137. 52. E. Lat. 6. 50. N.

FRIDWOMAN. *n. s.* [*free* and *woman*.] A woman who is free.—All her ornaments are taken from her; she is become a bondswoman. *Lev* 19. 20.

FRIEZE, *n. s.* in architecture, that part which is of columns, between the architrave and the frieze. It is properly a large flat surface, separating the architrave from the frieze. See *ARCHITECTURE*, *Index*.

FRIDWYN.

(2.) **FREEZE, FRIEZE, or Frize,** in commerce. See *FRIEZE*, N° 1.

(1.) * **To FREEZE.** *v. a.* pret. *froze*: part. *frozen* or *froze*. [*origen*, Dutch.] 1. To congeal with cold. 2. To kill by cold.—

When we both lay in the field,
Frozen almost to death, how did he lap me,
Ev'n in his garments! *Shak. Rich. III.*
—My master and mistress are almost frozen to death.
Shak. 3. To chill by the loss of power or motion.
I have a faint cold fear thrills through my veins,
That almost freezes up the heat of life. *Shak.*
Death came on again,
And exercis'd below his iron reign;
Then upward to the seat of life he goes:
Sense fled before him, what he touch'd he froze.

(2.) * **To FREEZE.** *v. a.* preter. *froze*. 1. To be congealed with cold.—The aqueous humour of the eye will not freeze, which is very admirable, seeing it hath the perspicuity and fluidity of common water. *Ray on the Creation*.—The freezing of water, or the blowing of a plant, forming an equidistant period in all parts of the earth, would as well serve men to reckon their years by as the motions of the sun. *Locke*. 2. To be of that degree of cold by which water is congealed.—

Ophiens with his lute made trees
And mountain tops, that freeze,
Bow themselves when he did sing.

Shak. Henry VIII.
Thou art all ice, thy kindness freeze.
Heav'n freeze above severe, the clouds congeal,
And thro' the chrystal vault appear'd the standing hail.

(1.) **FREEZING,** *n. s.* in philosophy, the same with congelation. See *COLD*, *CONGELATION*, *FROST*, and *ICE*. Freezing may be defined the fixing of a fluid body into a solid mass, by the action of cold. Water and some other fluids suddenly dilate and expand in the act of freezing, so as to occupy a greater space in the solid than in the liquid state: in consequence of which ice is specifically lighter than water and floats upon it. Water also loses of its weight by freezing, being found lighter after it is thawed, than before it was frozen. And it even evaporates nearly as fast while frozen, as while it is fluid. Water which has been boiled freezes more readily than that which has not been boiled; and a slight disturbance of the fluid disposes it to freeze more speedily; having sometimes been cooled several degrees below the freezing point, without coming to ice when kept quite still, but suddenly freezing on the least motion or disturbance. Water covered over with a surface of oil of olives, does not freeze so readily as without it; and melted absolutely preserves it under a strong frost, where olive oil would not. Rectified spirit of wine, nut oil, and oil of turpentine, seldom freeze. The surface of water, in freezing, appears all wrinkled; the wrinkles being sometimes in parallel lines, and sometimes like rays, proceeding from a centre to the circumference. Fluids standing in a current of air grow much colder than before. Fahrenheit had long ago observed, that a pond, which stands quite calm, often acquires a degree

of cold much beyond what is sufficient for freezing, and yet no congelation ensued: but if a slight breath of air happens in such a case to brush over the surface of the water, it freezes the whole in an instant. It has also been discovered, that all substances grow colder by the evaporation of the fluids which they contain, or with which they are mixed. If both these methods, therefore, be practised upon the same body at the same time, they will increase the cold to almost any degree of intenseness we please.

(2.) FREEZING, ASTONISHING EXPANSIVE FORCE OF. Although cold, in general, contracts most bodies, and heat expands them, yet there are some instances to the contrary, especially in the extreme cases or states of these qualities of bodies. Thus, though iron, in common with other bodies, expands with heat, yet, when melted, it is always found to expand in cooling again. Thus also, though water expands gradually as it is heated, and contracts as it cools, yet in the act of freezing it suddenly expands again, and that with an enormous force, capable of rending rocks, or bursting the very thick shells of metal, &c. A computation of the force of freezing water has been made by the Florentine Academicians, from the bursting of a very strong brass globe or shell, by freezing water in it; when, from the known thickness and tenacity of the metal, it was found that the expansive power of a spherule of water only one inch in diameter was sufficient to overcome a resistance of more than 27,000 pounds, or 13 tons and a half. See the experiments on bursting thick bomb-shells, by freezing water in them, by Major Edward Williams of the Royal Artillery, in the *Edin. Philos. Transf.* vol. 2. Such a prodigious power of expansion, almost double that of the most powerful steam-engines, and exerted in so small a mass, seemingly by the force of cold, was thought a very material argument in favour of those who supposed that cold, like heat, is a positive substance. Dr Black's discovery of latent heat, however, has afforded a very easy and natural explication of this phenomenon. He has shewn, that, in the act of congelation, water is not cooled more than it was before, but rather grows warmer: that as much heat is discharged, and passes from a latent to a sensible state, as had it been applied to water in its fluid state, would have heated it to 135° . In this process, the expansion is occasioned by a great number of minute bubbles suddenly produced. Formerly these were supposed to be cold in the abstract; and to be so subtle, that, insinuating themselves into the substances of the fluid, they augmented its bulk, at the same time that, by impeding the motion of its particles upon each other, they changed it from a fluid to a solid. But Dr Black shews, that these are only air extricated during the congelation; and to the extrication of this air he ascribes the prodigious expansive force exerted by freezing water. The only question, therefore, is, By what means this air comes to be extricated, and to take up more room than it naturally does in the fluid? To this it may be answered, that perhaps part of the heat, which is discharged from the freezing water, combines with the air in its

latic state, and, by restoring its elasticity, gives

it that extraordinary force; as is seen in the case of air suddenly extricated in the explosion of gun-powder.—The degree of expansion in the state of ice, is by some authors at about $\frac{1}{10}$ of its volume. Oil and wax shrink and contract after freezing. Malton relates several experiments of vessels made very thick and strong; in which, when water, close stopped, and exposed to the water being expanded in freezing, finding either room or vent, burst the strong barrel of a gun, with water in it, and when frozen, was rent the whole length, to try the force with which it expanded a cannon with it, whose sides were annealed and then closed up the mouth and vent, so that none could escape; the whole being exposed to strong freezing air, the water froze in a few hours, and burst the piece in two places. Mathematicians have computed the force of this expansion on this occasion; and they say, that such a force will raise a weight of 27720 pounds. Mr Williams, of the Royal Artillery, made several experiments on the force of it, at Quebec, in 1785. He filled all sizes of iron bomb-shells with water, then plugged the fuze hole close, and exposed them to the strong freezing air of that climate; sometimes driving the plugs as hard as possible with a sledge-hammer, and yet they were always thrown out by the sudden expansion of the water in the act of freezing, like a ball shot by gunpowder, sometimes at a distance of between 400 and 500 feet. They weighed near 3 pounds; and when they were screwed in, or furnished with hooks to lay hold of the inside of the shell, they could not possibly be forced out, unless the shell was always split in two, the thickness of the metal of the shell was from 1 to 2 inches. Through the circular crack, round the shells, where they burst, there issued a thin film or sheet of ice, like a fan; in cases where the plugs were projected by the water, there suddenly issued out from the hole a bolt of ice of the same diameter, and over it to the height sometimes of $8\frac{1}{2}$ inches.

(3.) FREEZING MIXTURES, preparatory to the artificial congelation of water, and ice. See COLD, § 8, 9; and ICE.

(4.) FREEZING, MR CAVENDISH'S EXPERIMENT. "If a vessel of water, (says Mr Cavendish) with a thermometer in it, be exposed to the freezing point, the thermometer will sink several degrees below the freezing point, especially if the water be covered up so as to be defended from the wind, and care taken not to agitate it; and then, by dipping in a bit of ice, or on mere agitation of ice shoot suddenly through the water, the inclosed thermometer rises quickly to the freezing point, where it remains stationary." Mr Cavendish adds, that though, in conformity to the common opinion, he has allowed that "mercury may set the water a freezing, yet some experiments lately made by Dr Blagden seem to shew that it has not much, if any, effect of freezing, otherwise than by bringing the water into contact with some substance colder than itself. In general also the ice shoots rapidly, and

thermometer rises very quick; yet he once d it to rise very slowly, taking up not less alf a minute, before it ascended to the ; point; but in this experiment the water led not more than one or two degrees be- ezing; and it should seem, that the more er is cooled below the freezing point, the idly the ice shoots and the inclosed ther- er rises." Mr Cavendish then observes, from the foregoing experiments we learn at is capable of being cooled considerab- e the freezing point, without any conge- taking place; and that, as soon as by any a small part of it is made to freeze, the ice rapidly through the whole of the water. use of this rise of the thermometer is, that almost all bodies, by changing from a flu- id state, or from the state of an elastic of an unelastic fluid, generate heat; and ld is produced by the contrary process. ll the circumstances of the phenomenon : perfectly well explained; for, as soon as e of the water freezes, heat will be gene- hereby in consequence of the above-men- law, so that the new formed ice and re- g water will be warmed, and must conti- receive heat by the freezing of fresh por- of water, till it is heated exactly to the e point, unless the water could become solid before a sufficient quantity of heat was ed to raise it to that point, which is not e: and it is eviden, that it cannot be heat- low the freezing point; for as soon as it e thereto, no more water will freeze, and quently no more heat will be generated.— eason why the ice spreads all over the wa- instead of forming a solid lump in one part, e, as soon as any small portion of ice is e, the water in contact with it will be so warmed as to be prevented from freezing, e water at a little distance from it will still ow the freezing point, and will consequen- to freeze. Were it not for this genera- f heat, the whole of any quantity of water freeze as soon as the process of congelation ; and in like manner the cold is generated : melting of ice; which is the cause of the ice required to thaw ice and snow. It was ly found that, by adding snow to warm e, and stirring it about until all was melted, e was as much cooled as it would have by the addition of the same quantity of wa- er more than 150° degrees colder than ow; or, in other words, somewhat more 150° of cold are generated by the thawing : snow; and there is great reason to believe ut as much heat is produced by the freezing er. The cold generated in the experiment entioned was the same whether ice or snow ed."

FREEZING OF QUICKSILVER. The con- on of quicksilver was first ascertained by M. h Adam Braun professor of philosophy at burg. He had been employed in making ometrical experiments, not with a view to the discovery he actually did, but to see how degrees of cold he could produce. An ex-

cellent opportunity for this occurred on the 14th of December 1759, when the mercury stood na- turally at 34°, which is now known to be only ; or 6° above its point of freezing. Mr Braun, to increase this great degree of natural cold, pre- pared a freezing mixture of aquafortis and pound- ed ice, by which his thermometer was sunk to 69°. Part of the quicksilver had now really con- gealed; yet so far was Mr Braun from entertain- ing any suspicion of the fact, that he had almost desisted from further attempts, being satisfied with having so far exceeded all former philosophers. But in the hopes of producing a still greater de- gree of cold, he renewed the experiment; but having expended all his pounded ice, he was ob- liged to substitute snow in its place. With this fresh mixture the mercury sunk to —100, 240, and 352°. He then supposed that the thermometer was broken; but on taking it out, he found the quicksilver fixed, and continuing so for 12 minutes. On repeating the experiment with another ther- mometer which had been graduated no lower than 220°, all the mercury sunk into the ball, and became solid as before, not beginning to re- ascend till after a still longer interval of time. He now concluded that the quicksilver was really frozen, and prepared for making a decisive expe- riment. This was accomplished on the 25th, and the bulb of the thermometer broken as soon as the metal was congealed. The mercury was now converted into a solid and shining metallic mass, which flattened and extended under the strokes of a pestle, in hardness rather inferior to lead, and yielding a dull sound like that metal. Pro- fessor Æpinus made similar experiments at the same time, employing both thermometers and tubes of a large bore; in which last he remarked, that the quicksilver fell sensibly on being frozen, assuming a concave surface, and likewise that the congealed pieces sunk in fluid mercury. The fact being thus established, and fluidity no longer to be considered as an essential property of quicksil- ver, Mr Braun communicated an account of his experiments to the Petersburg Academy, on the 6th of September 1760; of which a large extract was inserted in the *Philos. Trans.* vol. lxx. p. 156. After this he never suffered a winter to elapse, without repeating the experiment of freezing quicksilver, and never failed of success when the natural cold was of a sufficient strength for the purpose. This degree of natural cold he supposes to be 10° of Fahrenheit, though some commence- ment of the congelation might be perceived when the temperature of the air was as high as +2. The results of all his experiments were, that with the abovementioned frigorific mixtures, and once with rectified spirits and snow, when the natural cold was at 28°, he congealed the quicksilver, and discovered that it is a real metal which melts with a very small degree of heat. Not perceiving, however, the necessary consequence of its great contraction in freezing, he confounded its point of congelation with that of its greatest contrac- tion in freezing, and thus marked the former a great deal too low. The experiments of Mr Braun were successfully repeated at Gottingen, in 1774, by Mr John Frederick Blumebach;

who was encouraged to this attempt by the excessive cold of the winter that year, especially the night of Jan. 12th. when he made the experiment, the thermometer standing at 10° in the open air. At 5 P. M. put 3 drams of quicksilver into a small sugar glass, and covered it with a mixture of snow and Egyptian sal ammoniac, setting the glass out in the air upon a mixture also of sal ammoniac. At one the next morning, the mercury was found frozen quite solid, and fast to the glass; and did not melt till 7 or 8 A. M. The colour of the frozen mercury was a dull pale white with a blueish cast, like zinc, very different from the natural appearance of quicksilver. In Jan. and Feb. 1755, by similar means, quicksilver was twice frozen by Mr Hutchins, governor of Albany fort, in Hudson's bay. And the same was done on the 28th of Jan. 1776, by Dr Lambert Becker, secretary of Rotterdam. The temperature of the atmosphere was then at $+2^{\circ}$; and the lowest it could reduce the thermometer by artificial cold was 94° ; when, on breaking the glass, the mercury was found frozen. In the beginning of 1780, M. Ven Elterlein of Vytegra, a town of Russia, in lat. 61° north, and long. 36° east, froze quicksilver by natural cold. On the 4th January 1789, the cold being increased to 34° that evening at Vytegra, he exposed to the open air 3 oz. of very pure quicksilver in a china tea cup, covered with paper pierced full of holes. Next day, at 8 A. M. he found it solid, and looking like a piece of cast lead, with a considerable depression in the middle. On attempting to break it in the cup, his knife raised shavings from it as if it had been lead, which remained sticking up; and it length the metal separated from the bottom of the cup in one mass. He then took it in his hand to try if it would bend: it was stiff like glass, and broke in two pieces; but his fingers immediately lost all feeling, and could scarcely be restored in an hour and a half by rubbing with snow. At 8 o'clock the thermometer stood at 27° ; but by half past 9 it was risen to 40° ; and then the two pieces of mercury which lay in the cup had lost so much of their hardness, that they could no longer be broken, or cut into shavings, but resembled a thick mass, which though it became fluid when pressed by the fingers, immediately afterwards resumed the consistence of paper. With the thermometer at 39° , the quicksilver became fluid. The cold was never less on the 4th than 27° , and at 6 P. M. it had increased again to 35° . This experiment forms to fix the freezing point of mercury at 40° . Fahrenheit's thermometer, or 20 below 0; which is 72° below the freezing point of water. In the winter of 1791 and 1792, Mr Hutchins, repeated the experiment of freezing quicksilver by natural cold, with such success, that from his experiments and those of M. Ven Elterlein, the freezing point of mercury was ascertained as well settled, and that the freezing point of water is at $+32$. Other persons, however, had not been altogether so fortunate in this respect. Professor Lavoisier, for instance, exposed his mercury to the difference between the temperature of the fluid mercury, by which that of the surrounding metal by 10° ; he could not determine any thing

certain concerning it. On this subject of other curious facts may be found in *Transf.* vol. 51, p. 672; vol. 52, p. 156; 174; vol. 73, p. 303 and 325; vol. 70 vol. 77, p. 285; vol. 78, p. 43; vol. 7 &c.; being experiments on the congelation of quicksilver in England, by Mr Richard where he proves that mercury may be only in England in summer, but even in the coldest climate, at any season of the year, without the use of ice or snow.

(6.) FREEZING OF QUICKSILVER BY COLD. The most remarkable congelation of quicksilver, by natural cold, that has ever been observed, was that related by Dr Peter Simon who had been sent by the empress of Russia with some other gentlemen, on an expedition to that of Dr Gmelin. Being at Kratoich, 1772, in N. lat. $56^{\circ} 30'$, and E. long. 92° an opportunity of observing this phenomenon. On the 6th and 7th of Dec. (1772) he observed the greatest cold I have ever known in Siberia: the air was calm at the time, and the sun was very thickly thickened; so that, though the sky was in some respects clear, the sun appeared as a fog. I had only one thermometer left, the scale went no lower than 7° ; and in the morning, I remarked, that the mercury in it sunk into the ball, except some that which stuck fast in the tube. When I touched the thermometer, as it hung in the open air, it could plainly be seen, that the solid mercury stuck and resisted a good while, and when I pushed upward with a sort of violence, it came up a little time I placed upon the gallery, on the way to my house, some quicksilver in an open glass. Within an hour I found the edges and the middle of it frozen solid; and some minutes after it was condensed by the natural cold into a very much like tin. While the interior was still fluid, the frozen surface exhibited a variety of branched wrinkles; but in general remained pretty smooth in freezing. The unfrozen mercury was more flexible than lead, and being bent short, it was found more brittle; and when hammered out thin, it was somewhat granulated. If the hammer been perfectly cooled, the quicksilver was under it in drops; and the same happened when the metal was touched with a cold iron by which also the hammer was immediately cooled. When the frozen mass was broken in the cold, the fragments adhered to each other, and to the bowl in which they lay. In the morning it thawed on its surface gradually, like wax on the fire, and did not melt all at once. Although the most favourable weather could not yet be expected, yet the experiment was altered, and the experiment was repeated. On the 7th of Dec. I had an opportunity of making the same experiment all day; but, some hours after sunset, wind sprang up, which raised the thermometer to 20° , when the melted quicksilver began to rise. An instance of the natural congelation of quicksilver also occurred in Jan. 1782, at Upsala, Sweden, on the 11th Jan. 1782; and on

is observed the same effect of the cold : Bay ; when he found that at the point ing a mercurial thermometer stood at spirit thermometer at 30°.

FREEZING OF QUICKSILVER, DR BLACK'S
S FOR. Mr Cavendish and Dr Black
ed the proper method of obviating the
in this subject, which had not been clear-
of. Braun. (See § 5.) Dr Black, in a
r Hutchins, dated Oct. 5, 1779, gave
ng directions for making the experi-
accuracy: Provide a few wide and
of thin glass, sealed at one end and
: other; the wideness of these tubes
m one half to 3 quarters of an inch,
gth of them about three inches. Put
an inch and a half depth of mercury
these tubes, and plunging the bulb of
meter into the mercury, set the tube
mercury and the thermometer in it into
mixture, which should be made for
e in a common tumbler or water glass:

in making a freezing mixture with
pirit of nitre, the quantity of the acid
r be so great as to dissolve the whole
, but only enough to reduce it to the
of panada. When the mercury in the
is thus set in the freezing mixture, it
irred gently and frequently with the
thermometer; and if the cold be suf-
ong, it will congeal by becoming thick
like an amalgam. As soon as this is
he thermometer should be examined
ing it out of the congealing mercury;
; no doubt that in every experiment
; with the same mercury, the instru-
always point to the same degree, provi-
an made and graduated with accuracy."

FREEZING OF QUICKSILVER, MR ÆPI-
SECTION FOR. Mr Æpinus gives the
irection for using the tuming spirit of
ake some of this spirit, cooled as much
and put it into a wine glass till it be
full, filling it up with snow, and stir-
til the mixture become of the consis-
p; by which means you obtain, almost
nt, the necessary degree of cold for
g of quicksilver."

FREEZING OF QUICKSILVER, MR BRAUN'S
ONS FROM. In the course of his obser-
r Braun found, that double aquafortis
effectual than spirit of nitre; but with
spirit, which seldom brings the mer-
than 148°, this metal may be frozen
wing manner: Six glasses being filled
as usual, and the thermometer put in
m, the spirit of nitre was poured upon
the mercury would fall no lower in this,
meter was removed to the second, and
e third and fourth, in which fourth im-
he mercury was usually congealed. Mr
arks, that by the mixture of snow and
ich froze the mercury, he never was
ng thermometers, filled with the most
ified spirit of wine, lower than 148°:
cold which will freeze mercury, will
spirit of wine; and therefore spirit ther-
are the most fit to determine the de-

gree of coldness in the frigorific mixtures, till we
can construct solid metallic thermometers with
sufficient accuracy. Mr Braun tried the effects
of different fluids in his frigorific mixtures: he al-
ways found that Glauber's spirit of nitre and
double aquafortis were the most powerful; and
from a number of experiments made when the
temperature of the air was between 21° and 28°
of Fahrenheit, he concludes, that spirit of salt
pounded upon snow increased the natural cold
36°; spirit of sal ammoniac, 12; oil of vitriol, 42;
Glauber's spirit of nitre, 70; aquafortis, 48; simple
spirit of nitre, 35; dulcified spirit of vitriol, 24;
Hoffman's anodyne liquor, 38; spirit of hartshorn,
12; spirit of sulphur 12; spirit of wine rectified,
24; camphorated spirit, 18; French brandy, 14;
and that several kinds of wine increased the na-
tural cold to 7, 8, or 9 degrees.

(10.) **FREEZING OF QUICKSILVER, MR CA-**
VENDISH'S APPARATUS FOR, AND MR HUT-
CHINS'S EXPERIMENTS ON. The apparatus
recommended by Mr Cavendish, and which
Mr Hutchins made use of (§ 11.) consisted of a
small mercurial thermometer, the bulb of which
reached about 2½ inches below the scale, and was
inclosed in a glass cylinder swelled at the bottom
into a ball, which, when used was filled with quick-
silver, so that the bulb of the thermometer was
entirely covered with it. If this cylinder be im-
mersed in a freezing mixture till great part of the
quicksilver in it is frozen, it is evident that the
degree shown at that time by the inclosed ther-
mometer is the precise point at which mer-
cury freezes; for as in this case the ball of the
thermometer must be surrounded for some time
with quicksilver, part of which is actually frozen,
it seems impossible that the thermometer should
be sensibly above that point; and while any of
the quicksilver in the cylinder remains fluid, it is
impossible that it should sink sensibly below it.
The diameter of the bulb of the thermometer was
rather less than a quarter of an inch; that of the
swelled part of the cylinder two thirds; and as it
was easy to keep the thermometer constantly in
the middle of the cylinder, the thickness of quick-
silver betwixt it and the glass could never be much
less than the other sixth part of an inch. The
bulb of the thermometer was purposely made as
small as it conveniently could, to leave a sufficient
space between it and the cylinder, without ma-
king the swelled part larger than necessary, which
would have caused more difficulty in freezing the
mercury in it. The first experiment with this
apparatus was made on the 15th Dec. 1781;
the thermometer had stood the evening before at
18°. A bottle of spiritus nitri fortis was put on
the house-top, to cool it to the same temperature.
The thermometers made use of had been hung
up in the open air for three weeks, to compare
their scales. On the morning of the experiment
they were about 23° below 0.—In making it, the
thermometer of the apparatus was suspended in
the bulb of the cylinder by some red worsted
wound about the upper part of its stem, to a suffi-
cient thickness, to fill the upper part of its orifice;
and a space of near half an inch was left empty
between the quicksilver and the worsted. The
apparatus was placed in the open air, on the top

of the fort, with only a few deer skins sewed together for a shelter; the snow lay 18 inches deep on the works, and the apparatus was stuck into the snow, to bring it to the temperature of the air. The instruments were afterward placed in three fresh freezing mixtures, in hopes of being able by their means to produce a greater degree of cold, but without effect; nor was any greater cold produced by adding more spirit of nitre. The mercury, however, was very completely frozen, that in the thermometer descending to 448° . On plunging the mercury into the freezing mixture, it descended in less than one minute to 40° below 0. Mr Hutchins made other 7 experiments with various proportions of the mixture, of which we shall only describe the last. His 8th experiment was made with a view to try whether quicksilver would congeal when in contact with the freezing mixture. For this purpose, he did not use the apparatus provided for other experiments, but filled a gallipot made of flint stone (as being thinner than the common sort), containing about an ounce, half full of quicksilver, into which he inserted a mercurial thermometer, employing another as an index. Thus he hoped to determine exactly when the quicksilver was congealed, as he had free access to it at all times, which was not the case when it was inclosed in the cylindrical glass, the worsted wound round the tube of the thermometer to exclude the air being equally effectual in excluding any instrument from being introduced to touch the quicksilver. He then made a kind of skewer, with a flat blunt point, of dried cedar wood, on account of its lightness, which he found would remain in the gelatinous freezing mixture at any depth he chose; but, when inserted into the quicksilver, the great difference betwixt the specific gravity of it and that ponderous fluid, made it always rebound upwards; and by the degree of resistance, he could always know whether it proceeded from fluid or solid metal. At this time, however, the experiment did not succeed; but, at another trial, having employed about $\frac{3}{4}$ ths of a pound of metal, and let it remain a considerable time immersed in the same mixture which had just now been supposed to fail, he found that part of it was congealed; and on pouring off the fluid part, no less than two thirds remained fixed at the bottom.

(II.) FREEZING OF QUICKSILVER, Mr CAVENDISH'S EXPERIMENT ON. An experiment was at last made by Mr Cavendish himself, of which he gives the following account in the *Phil. Trans.* vol. lxxiii. p. 325. Here, speaking of the cold of freezing mixtures, he says, "There is the utmost reason to think that Mr Hutchins would have obtained a greater degree of cold by using a weaker nitrous acid than he did. I found (says he) by adding snow gradually to some of this acid, that the addition of a small quantity produced heat instead of cold; and it was not until so much was added as to increase the heat from 28 to 51° , that the addition of more snow began to produce cold; the quantity of snow required

for this purpose being pretty exactly one quarter of the weight of the spirit of nitre, and the heat of the snow, and air of the room, as well as the acid, being 28° . The reason of this is, a great deal of heat is produced by mixing snow with spirit of nitre; and the stronger the spirit, the greater is the heat produced. Now it appears from this experiment, that before the acid was diluted, the heat produced by its union with the water formed from the melting snow, was greater than the cold produced by the same; it was not until it was diluted by the addition of one quarter of its weight of that substance, that the cold, generated by the latter cause, began to exceed the heat generated by the former. By what has been said, it is evident, that a freezing mixture made with undiluted acid will not generate cold until so much snow is dissolved as to increase its heat from 28 to 51° ; so that a greater cold will be produced than would be obtained by mixing the diluted acid heated with snow of the heat of 28° . This method of adding snow gradually is much the best I know, of finding what strength it ought to be in order to produce the greatest effect possible. By means of this acid diluted in the above mentioned proportion, I froze quicksilver in the thermometer called G \dagger by Mr Hutchins, on the Feb. 1781. I did not indeed break the thermometer to examine the state of the quicksilver in; for as it sunk to 110° , it certainly must have been in part frozen; but immediately took it out and put the spirit thermometer in its room, in order to find the cold of the mixture. It sunk to 30° ; but by making allowance of the spirit, the tube being not so cold as that in the former experiment, appears, that if it had not been for this cause, it would have sunk to 35° \ddagger ; which is 6° below the point of freezing, and is within one degree of the great cold as that produced by Mr Hutchins. In this experiment the thermometer G sunk rapidly; and, as far as I could perceive, without stopping at any intermediate point till it came to the above mentioned degree of 110° , where it stuck. The materials used in making the mixture were previously cooled, by means of salt and snow to near 0; the temperature of the air was between 20° and 25° ; the quantity of acid was $4\frac{1}{2}$ oz.; and the glass in which the mixture was made, was surrounded with wool, and placed in a wooden box, to prevent its losing its cold as it would otherwise have done. Some weeks before this, I made a freezing mixture with spirit of nitre, much stronger than that used in the foregoing experiment, though not quite so strong as the undiluted acid, in which the cold was less intense by $4\frac{1}{2}^{\circ}$. It is true, the temperature of the air was much less cold, namely 35° , but the spirit of nitre was at least as cold, and the snow was much less so. The cold produced by mixing of vitriol, properly diluted with snow, is not so great as that produced by spirit of nitre, though it does not differ from it by so much as 8° . A freezing mixture, prepared with diluted acid

\dagger This was a small mercurial thermometer, made by Nairne and Blount, on an ivory scale, divided at every five degrees, and reaching from 215° above, to 250° below the cypher.

\ddagger This is to be understood of a spirit thermometer, whose $29^{\circ} = 40^{\circ}$ of Fahrenheit's mercurial.

whose specific gravity, at 60° of heat, 642, sunk in the thermometer C to 37°, criment being tried at the same time, and the same precautions, as the foregoing. It was found, by adding snow gradually to this acid, as was done by the nitrous acid, that it was a little, but not much stronger, ought to be, in order to produce the greatest.

FREEZING OF QUICKSILVER, Mr WALLER'S EXPERIMENTS ON. See COLD, § 9.

FREEZING OF VITRIOLIC ACID. Acids, of those of the mineral kind, powerfully resist congelation. There is, however, a peculiarity with regard to that of vitriol. M. Chaptal found, that it condensed by the cold of the ice, and the crystals began to melt only 2° of his thermometer; which, if Reaumur's, would be about 47° of Fahrenheit. The crystals were unctuous from the melting acid, and were warmer than the neighbouring bodies: the former was that of a prism of six sides, flattened by a pyramid of six sides; but the latter appeared on one end only; on the other, it was lost in the general mass. The pyramid resulted from an assemblage of six isosceles triangles: the oil when the crystal was melted was brownish black; on redistilling it in a proper apparatus, no peculiar gas came over. M. Chaptal repeated his experiments with the highly concentrated acid, but found that it did not freeze; the density of the acid which he thought froze was to the oil, of the usual strength, as from 63 to 65; and the necessary degree of cold about 19° of Fahrenheit. Vitriol once melted will not crystallize again at the same degree of cold. M. Moré, a concentrate manufacturer of oil of vitriol at Hadamar Vervier, in Limbourg, attributes this property to the addition of nitrous air. The

oil of vitriol is usually separated from sulphur by distilling it in close vessels; and the air is supplied by adding to the sulphur a little nitre. He found that by mixing the acid, capable of being mixed, with water, or employing it for other purposes, orange-coloured fumes, and the smell of true nitrous acid, were very evident. His gas was destroyed, no degree of cold could congelate the acid, whatever was its degree of concentration; and the congelation was generated immediately after the process by which the acid was obtained. Mr Macquer repeats in the 2d edition of his *Chemical Dictionary*, **VITRIOLIC ACID**, that the duke d'Ayen observed the congelation of concentrated vitriol, which had been exposed to a cold expressed by 13° or 14° below 0 on Reaumur's thermometer; but that mixtures, consisting of one part of the above mentioned concentrated acid, to 10 or more parts of water, could not be frozen by the cold to which he exposed them, till he diluted the acid so much that its density was that of water as 104½ to 96; in which latter case it is probable that the water was only frozen, as in diluted solutions of salts. Similar experiments were made by M. de Morveau, with equal success. Having produced an insoluble salt by pouring spirit of nitre on pounded

ice, he congealed a part of some vitriolic acid which had been previously concentrated; but he observed, that though a very intense cold had been made use of to congelate the acid at first, it nevertheless remained congelated in much smaller degrees of cold, and that it thawed very slowly. This coincides with the observations of M. Chaptal; though the latter observes, that there is some difference between strong oil of vitriol lowered with water, and that produced by a given strength by rectification. The latter always has some colour; and it will not dissolve indigo in such a manner as to carry the colour into stuff, though the stronger oil, diluted to the same degree, succeeds very well. Some observations were also made by Mr M'Nab at Hudson's Bay, an account of which is given in the *Phil. Transf.* for 1786, by Mr Cavendish. From them it appears, that a vitriolic acid, whose specific gravity was to that of water as 1843 to 1000, froze when exposed to a cold of 15° of Fahrenheit's scale; that another more diluted vitriolic acid, consisting of 629 parts of the former concentrated acid, and 351 parts of water, congelated in a temperature of 36°; and that, when farther diluted, it was capable of sustaining a much greater degree of cold without freezing at all. In these experiments, as well as in those of Mr Morveau, it appeared that the whole of the acid did not congelate, but that part of it retained its fluidity; and on examining the strength of that which remained fluid, Mr Cavendish found that there was very little difference between it and the other; whence he was led to suppose, that the reason of this congelation does not arise from any difference in strength, but on some less obvious quality, and such as constitutes the difference between common and icy oil of vitriol. In all the experiments hitherto made, however, Mr Cavendish had found some uncertainty in determining the point of easiest freezing; neither could he determine whether the cold necessary for congelation does not increase without any limitation in proportion to the strength of the acid. A new set of experiments were therefore made by Mr Keir to determine this point, which our room permits us not to quote; but from which Mr Keir draws the following inferences: "1. That the vitriolic acid has a point of easiest freezing, and that this is when its specific gravity is to that of water as 1780 to 1000. 2. That the greater or less disposition to congelation does not depend on any other circumstance than the strength of the acid. 3. That the freezing and thawing degree of the most congelable acid is about 45° of Fahrenheit's scale. It is, however, to be observed, that this degree is inferred from the temperature indicated by the thermometers immersed in the freezing and thawing acids; but the congelation of the fluid acid could never be accomplished without exposing it to a greater degree of cold, either by exposing it to the air in frosty weather, or to the cold of melting snow. 4. Like water, this acid possesses the property of retaining its fluidity when cooled several degrees below the freezing point; and of rising suddenly to it when its congelation is promoted by agitation, or by contact even with a warmer thermometer. 5. That, like water and other congelable fluids, the vitriolic

the quantity of the aqua-fortis, and heat of the fire, &c. &c. though the quantity of the acid which remains to be determined by the quantity of the aqua-fortis. That the acid, by congelation, assumes a regular crystalline form, and acquires a greater facility and hardness, than it possessed in its fluid state. Besides the species of congelation, the acid is subject to another; probably first discovered by Basil Valentine and some other alchemists. This is effected in the ordinary temperature of the air, even in summer; and, according to Mr Keir, is peculiar to that species of oil of vitriol which is distilled from green vitriol, and which is possessed of a smoking quality in a high degree: "for not only the authors (says he) who in this congelation has been observed, have given this description of the acid employed, but also the late experiments of Mr Dollfus, seem to show that this smoking quality is essential to the phenomenon: for neither the acid obtained from the vitriol, when deprived by rectification of its smoking quality, nor the English oil of vitriol, which is known to be obtained by burning sulphur, and which does not smoke, were found by his trials to be susceptible of this species of congelation. It may, however, be worth the attention of those chemists who have an opportunity of seeing this *icy oil of vitriol*, as it is called, to observe more accurately than has yet been done, the freezing temperature and the density of the congelable acids; and to examine whether the density of this smoking acid also is connected with the glacial property. It seems also further deserving of investigation, whether there be not some analogy between the congelation of the smoking oil of vitriol, and the very curious crystallization which Dr Priestley observed in a concentrated vitriolic acid, furnished with nitrous acid vapours; and whether this smoking quality does not proceed from some marine or other volatile acid, which may be contained in the natural vitriol whence the vitriolic acid is obtained."

Freezing point. Denotes the point or degree of cold, by a mercurial thermometer, at which certain fluids begin to freeze, or when frozen, at which they begin to thaw again. On Fahrenheit's thermometer, it is placed at 32 degrees below, and at 17 for quinquely, the latter is reckoned in those two points respectively. It would be useful to the freezing points for other fluids were ascertained, and the whole arranged in a table.

Freezing River. or **Freezing Lake.** A very common kind of thaw, when the water of England, in Dec. 1672, was frozen to the depth of 10000 fathoms in the *Plumbeous* (the river).

Freezing point. Denotes the point or degree of cold, by a mercurial thermometer, at which certain fluids begin to freeze, or when frozen, at which they begin to thaw again.

Freezing point. Denotes the point or degree of cold, by a mercurial thermometer, at which certain fluids begin to freeze, or when frozen, at which they begin to thaw again.

FRIUS, John Thomas, a learned German,
 Würzburg, in the 16th century. He studied
 Julius and Remus, and was made rector of
 the school at Altorf in 1575. He died at Basil in
 1590. He wrote, 1. *Questiones Geometricæ et*
Philosophicæ: 2. *Logica Consulatorum*: 3. A Latin
 version of Frobenius's voyages: 4. Notes, his-
 torical, political, &c. on Cicero's Orations.
 FRENE, a town of France, in the dep. of
 the Loire: 20 miles W. of Angers.

FREISHEIM, a town of Germany, in the
 elector. of the Rhine, taken by the French in
 1794, and now included in the French republic,
 of Mont Tonnerre. It is 4 miles NNE.

FREED, John, a learned English physician,
 born at Croton, in Northamptonshire,
 In 1696, he published, in conjunction
 with Foulkes, an edition of two Greek or-
 ations of Æschines against Ctesiphon, and
Oratio de Corona, with a new Latin ver-
 sion. In 1699, he wrote a letter to Dr Sloane
 on an *Hydrocephalus*, published in the
Trans. and another letter in Latin to
 a gentleman, *De spasmi rarioris, historia*,
 in the same Transactions. In 1703,
Ætiologia appeared; which gained him
 a fellowship in the university of Oxford. In
 1704, he attended the earl of Peterborough to
 physician to the army there; and upon
 his return in 1707, published an account of the
 expedition. In 1709, he published his *Cle-*
mentia. In 1712, he attended the duke of
 Flanders, as his physician. In 1716,
 elected a fellow of the college of physi-
 cians in London. This year he published the 1st
 book of Hippocrates *De morbis populari-*
bus Commentary on Fevers, written by him-
 self M. P. for Launceston in Cornwall in
 1717, where he distinguished himself by his opposi-
 tion to the ministry. In March 1722, he was com-
 mitted to the tower on a charge of high treason:
 while he was under confinement, he wrote a
 letter to Dr Mead, *De quibusdam variolarum*
speciebus, and began his *History of Physic*, the first
 of which was published in 1725, and the 2d
 in 1726. Upon the accession of George II, he
 was appointed physician to the queen, who show-
 ed the highest esteem for him. He died at Lon-
 don in 1728. His works were published together
 at London, in folio, in 1733, and dedica-
 ted to the queen.

DORFF, a town of Germany in Auf-
 spurg, SE. of Tulln.

FREISHEIM, a town of Germany, lately in
 the elector. of the Rhine, now included in the
 French republic, of Mount Tonnerre: 10
 miles W. of Mannheim.

FREMIUS, John, a learned and elegant
 Latin poet.

author, born at Ulm in 1608. He made supple-
 ments to Livy, Tacitus, and Q. Curtius, in 60
 books, printed at Strasburg in 1664. He wrote
 likewise Notes upon Q. Curtius, Florus, Tacitus,
 and some other Latin classics; and died in
 1660. He was professor at Upsal and Heidelberg.

FREIRE DE ANDRADE, Hyacinth, a Portu-
 guese author, born at Beja, in 1597. He was ab-
 bot of St Mary de Chans, and wrote a life of John
 de Castro, which is much esteemed. He also
 wrote some poems in the Portuguese tongue, and
 died at Lisbon, in 1657.

 of Landau.

FREISENGEN. See FREYSINGEN, N° 1, 2.

FREITS. See FREATS.

FREJULS, or } A town of France, in the dep.
 FREJUS, } of Var, anciently called Fo-
 RUM JULIUM, or JULI. See FORUM. § V, N°
 8. It was a flourishing sea port town in the
 time of Julius Cæsar. An amphitheatre, statues,
 inscriptions, and other relics of antiquity are still
 to be seen in it. It was the birth place of Julius
 Agricola. It is seated near the Argens, 40 miles
 NE. of Toulon. Lon. 6. 50. E. Lat. 43. 23. N.

FREIXE, a town of Portugal, in the prov. of
 Traios-Montes, 15 miles S. of Meraodel.

FREIXEIRA, a town of Portugal, in the prov.
 of Entre-Duero-e-Minho; 7½ miles NE. of Apan-
 rante.

FREKENHAM, 2 English villages: 1. in Nor-
 folk: on the Bure: 2. in Suffolk, near Mildenhall.

FREMINGTON, 2 small towns: 1. in De-
 vonshire, W. of Barnstaple: 2. in Yorkshire, near
 Richmond.

* FREN. *n. f.* A stranger. An old word
 wholly forgotten here; but retained in Scotland.
Beattie.—

But now from me his madd'ning mind did start,
 And wooes the widow's daughter of the glen;
 And now fair Rosalind hath bred his smart.

So now his friend is changed for a fren. *Spens.*

FRENAYE, two towns of France, in the dep.
 of Sarthe: 1. six miles E. of Alençon: 2. ci-devant
Le Vicomte: 9 miles SSW. of Alençon. Lon. 17.
 41. E. of Ferro. Lat. 48. 17. N.

(1.) FRENCH. *a. f.* belonging to France.

(2.) FRENCH, *n. f.* the citizens of France.

(3.) FRENCH, in geography, a river of the Uni-
 ted States, in Massachusetts, which rises from a
 pond in Worcester county, and runs into the
 Quinebaug in Connecticut; so named from the
 French Protestants, who settled on its banks, af-
 ter the revocation of the Edict of Nantz, in 1635.

(4.) FRENCH BEAN, in botany. See PHASEO-
 LUS.

(5.) FRENCH BROAD, a navigable river of Ten-
 nessee, from 400 to 500 yards broad, formed by
 several head waters that rise in N. Carolina, on
 the SE. of the Great Iron and Bald Mountains.
 After running 56 miles NW. between these moun-
 tains, and 25 miles N. it joins the Helixia 11
 miles above Knoxville.

(6.) * FRENCH CHALK. *n. f.* French chalk is an
 indurated

Indurated clay, extremely dense, of a smooth glossy surface, and soft and unctuous to the touch; of a greyish white colour, variegated with a dusky green. *Hill.*—*French chalk* is unctuous to the touch, as steatites is, but harder, and nearer approaching the consistence of stone. *Woodward.*

(7.) FRENCH CREEK, a river of N. America, the N. head water of the ALLEGANY, into which it falls on the N. side of Fort Franklin, 80 miles NE. of Pittsburg.

(8.) FRENCH HONFYSUCKLE. See HEDYSARUM.

(9.) FRENCH LANGUAGE, the language now spoken in France, which, like the English, is not an original language, but a medley of several. Those that prevail most, and are the basis of it, are, 1. The Celtic; whether that were a particular language itself, or whether it were only a dialect of the Gothic, as spoke in the West and North: 2. The Latin, which the Romans carried with them into Gaul, when they conquered it: And, 3. The Teutonic, or that dialect of the Teutonic spoken by the FRANKS, when they passed the Rhine, and established themselves in Gaul. Of these three languages, in the space of about 1300 years, was the modern French gradually formed. Its progress was very slow. Both the Italian and Spanish were regular languages long before the French. Pasquier observes, it was under Philip of Valois that the French tongue first began to be polished; and that, in the register of the chamber of accounts of that time, there is a purity almost equal to that of the present age. However, the French was still very imperfect till the reign of Francis I. The custom of speaking Latin at the bar, and of writing the public acts and instruments of the courts of justice in that language, had made the French overlook their own language. The preceding ages had been remarkable for their ignorance, owing, in a great measure, to the long and calamitous wars which France had been engaged in: whence the French nobility deemed ignorance a kind of merit; and the generals did not regard whether they wrote and talked politely or not, provided they could fight well. But Francis I. restored learning, and changed the face of affairs; and after his time, Henry Stevens printed his book, *De la Precellence du Langage Francois*. The change was become very conspicuous at the end of the 16th century; and under Henry IV, Amyot, Coeffeteau, and Malherbe, contributed towards bringing it to perfection; which Cardinal Richelieu completed, by the establishment of the French academy; a society of which the most distinguished persons in church and state have been members. Nor did the long reign of Lewis XIV. contribute little to the improvement of the language; his taste for the fine arts rendered his court the politest in Europe. Wit and magnificence seemed to vie; and his generals might have disputed with the Greeks, Romans, &c. the glory of writing well, if they could not that of fighting. From the court, the elegance and purity of the language soon spread itself into the provinces; where there are now very few who do not write and speak good French. One character of the French language is, that it is natural and easy. The words are ranged in it

much in the same order as the ideas in which it differs exceedingly from the Latin, where the inversion of the natural words is reputed a beauty. The Helles even the French in this point, but of it in copiousness and variety. But analogy of grammar, and the simplicity with the moods of verbs are formed, has the advantage not only over the: over all the known languages in the: the peculiar expressions and idioms of are sometimes so quaint and extraordinary it loses a good deal of the advantage grammatical simplicity gives it over the French has few compound words, which differs widely from the Greek, High English. This the French authors admit to be a great disadvantage; the Greek deriving a great part of their force from the composition of words, and expressing that in one sounding word, French cannot express but by a periphrasis; diminutives in the French are as few as pounds, the greatest part of those in lost their diminutive signification. It is chiefly admired for its justness, purity and flexibility. It is the most universal language in Europe. The policy of courts has rendered it necessary for that of princes, &c. and the discoveries and inventions made by the French in arts and sciences have had the same effect among the in Germany, and elsewhere, the princesses of distinction value themselves on speaking French; and in several courts French is almost as much used as the in the country.

(10.) FRENCH REPUBLIC. See FRANCE 59, 61, 65; and REPUBLIC. Under we mean here only to give a sketch of extent of the territory of the republic, been greatly increased since the commencement of the present war, in consequence of its conquests and annexations. The ci-devant of Savoy, the county of Nice, and the city of Monaco; the whole Belgic province comprehending the countries of Liege, Stavelot, Malmédy, Hainault, Tournais, Flannant, Namur, Austrian Gueldres, Maaseik, Limburg, and Luxemburg; and territories on the left, or W. bank of the Rhine comprehending those of Mœurs, Cleves, duchies of Juliers, Aremberg, and Drenthe; part of the electorates of Cologne, Treves, and the Palatinate of the Rhine; the Saarbruck, the bishopric of Worms, &c. together with the ci-devant republic of the Netherlands are now annexed to the French republic. It is divided into the following 18 departments, viz. Mount Blanc, Maritime Alps, the Scheldt, the Lys, Jemappes, Flanders, the Ourte, the Loire, the two Nethes, the Roer, the Eifel, the Moselle, the Rhine and Nahe, the Moselle, Mount Tonnerre, and Lake Geneva. That the republic now consists of 101 departments in all. Besides these extensive territories the county of Venaisin, and the principa

and Mountbelaird, (which, though insular France, were considered as no part of the monarchy.) are also now included public. Whether the French government may be able to retain all these important acquisitions, the future events will show, and the definitive treaty of peace will determine. At present (July 1800) the total territory of the republic, exclusive of Corsica, is from 5° 5' Lon. W. to 7° 47' E. 42° 30' to 51° 0' Lat. N.

FRANK RIVER, a river of Upper Canada runs from Lake Huron, to Lake Nipigon.

FRANK TOWN, a town of Maryland, in the county of Elk, 1 mile S. of Elktown.

FRANK, a village in Gloucestershire.

FRANKFURT, a town of Ireland in Kil-

FRANCHISE. *v. a.* [from *French*.] To imitate the manners of France; to make a country mislike nothing more in king Edward the Confessor than that he was *Frenchified*; imitated the desire of foreign language then broken of bringing in foreign powers, and happened. *Camden*.—

Has he familiarly disliked show starch, or said your doublet is exactly *Frenchified*? *As you like it*.

FRANCHIMAN'S BAY, a bay on the S. coast of Jamaica, between Great Pedro and Starve-

FRANCHIMAN'S BAY, a bay of the United States on the coast of Lincoln county, in the distance, between Mount Desert Island and Point. Lon. 68. 1. W. Lat. 44. 20. N. **FRANK**, a river of Germany in the circle of the Rhine, which runs into the Elbe, &c.

FRANK, a town of France, in the department of Maine, 4 miles ESE. of Bourbogne.

FRANTICK. *adj.* [*frenetique*, French; generally therefore written *phrenetic*.] Rattled.—

He himself impotent,
Of his *frenetick* malady. *Daniel*.

FRANKLIN'S LAKE, a lake of N. America in New York, St John's River runs through it.

FRANKLEIN, a town of France, in the county of Oise, 7 miles SW. of Compiègne.

FRANKFURT, a town of Westphalia, in the county of Bielefeld, 3 miles NNW. of Nor-

FRANZ. *n. f.* [*frensis*; *phrenitis*, Lat. *frenetis*, *phrenetis*, *phrensis*, or *frensis*.] Distraction of mind; alienation of mind; any violent passion approaching to madness. That knave, Ford, hath the finest mad-ness in him that ever governed *frenzy*. *Henry*.—

Fortitude is seen in great exploits,
Ice warrants, and that wildness guides:
How 'ring *frenzy* and distraction. *Cato*.
In a disposition of the body induceth
which disturbs all the operations of the
occasions a lethargy or *frenzy*: this
exceeds our narrow faculties. *Bentley*.
FRANZ. See MEDICINE & PHRENITIS.

* **FREQUENCY**. *n. f.* [*frequentia*, Fr. *frequentia*, Latin.] Crowd; concourse; assembly.—

The *frequency* of degree
From high to low throughout. *Shak. Timon*.
He, in full *frequency* bright
Of angels, thus to Gabriel smiling spake. *Mil.*

* **FREQUENCY**. *n. f.* [*frequentia*, Latin.] 1. Common occurrence; the condition of being often seen or done.—Should a miracle be indulged to one, others would think themselves equally intitled to it; and if indulged to many, it would no longer have the effect of a miracle; its force and influence would be lost by the *frequency* of it. *Atterbury*. 2. Concourse; full assembly.—

Thou canst not crevice into this senate: who
Of such a *frequency*, to many friends

And kindred thou hast here, saluted thee? *Jon.*

* **FREQUENT**. *adj.* [*frequent*, Fr. *frequent*, Latin.] 2. Often done; often seen; often occurring.—The *frequent* these times are, the better. *Duty of Man*.—

An ancient and imperial city falls;
The streets are fill'd with *frequent* funerals.

Dryden's Æneid.
Frequent horses shall besiege your gates. *Pope*.

2. Used often to practise any thing.—The Christians of the first times were generally *frequent* in the practice of it. *Duty of Man*—Every man thinks he may pretend to any employment, provided he has been loud and *frequent* in declaring himself hearty for the government. *Swift*. 3. Full of concourse.—

Frequent and full. *Milton*.

* **TO FREQUENT**. *v. a.* [*frequentare*, Latin; *frequentare*, French.] To visit often; to be much in any place; to resort often to.—

They in latter day,
Finding in it fit ports for sailors trade,
'Gan more the time *frequent*, and further to in-
vade. *Spenser*.

—There were synagogues for men to resort unto:
our Saviour himself and his apostles *frequented*
them. *Hosier*.—

This fellow here, this thy creature,
By night *frequent* my house. *Shak. Timon*.
—At that time this land was known and *frequent-
ed* by the ships and vessels. *Bacon*.—

With tears
Wat'ring the ground, and with our sighs the air
Frequenting, sent from hearts contrite, in sign
Of sorrow unteign'd, and humiliation meek.
Milton.

To serve my friends, the senate I *frequent*;
And there what I before digested, vent. *Denis*.
—That he *frequented* the court of Augustus, and
was well received in it, is most undoubted. *Dryd*.

* **FREQUENTABLE**. *adj.* [from *frequent*.] Conversable; accessible. A word not now used, but not inelegant.—While youth lasted in him, the exercises of that age and his humour, not yet fully discovered, made him somewhat the more *frequentable* and less dangerous. *Sidney*.

* **FREQUENTATIVE**. *adj.* [*frequentativus*, Fr. *frequentativus*, Lat.] A grammatical term applied to verbs signifying the frequent repetition of an action.

* **FREQUENTER**. *n. f.* [from *frequent*.] One who often resorts to any place.—Persons under

seen but some light skirmishes, in their vain bravery made light account of the Turks. *Knolles's Hist. of the Turks.*

(2.) FRESHWATER, in geography a river of Wales in Pembrokeshire, which runs into the Sea, and forms a bay, 6 miles SE. of Pembroke Haven.

(3.) FRESHWATER BAY, a bay in the Straits of Magellan. Lon. 72. 13. W. Lat. 53. 27. N.

(4.) FRESHWATER BAY, a bay on the E. coast of Newfoundland. Lon. 53. 30. W. Lat. 49. 10. N.

(5.) FRESHWATER BAY, a bay on the W. coast of the isle of Wight. Lon. 1. 31. W. Lat. 50. 37. N.

(1.) PRESNE, Charles DE, Sieur DU CANGE, one of the most learned writers of his time, was born at Amiens in 1610, and studied at the Jesuits college in that city. Afterwards he studied the law at Orleans, and gained great reputation by his works; among which are, 1. The history of Constantinople under the French emperors. 2. John Cinnamus's History of the affairs of John and Manuel Comnenus, in Greek and Latin, with historical and philological notes. 3. *Glossarium ad Scriptores mediæ & infimæ Latinitatis*: 6 vols folio. 4. A Greek Glossary, consisting of curious passages from rare MSS. 2 vols folio. He died in 1688, aged 78. Lewis XIV settled pensions on his 4 children.

(2.) PRESNE, a town of France, in the dept. of the Meuse; 10½ miles SE. of Verdun, and 12 NNE. of St Mihiel.

(3.) PRESNE ST MEMETZ, a town of France, in the dept. of Upper Saône; 12 miles SE. of Gray, and 12 SW. of Vesoul.

FRESNEAU, a town of France, in the dept. of Oise; 10 miles S. of Beauvais.

(1.) FRESNES, a town of France, in the dept. of Calvados, 12 miles S. of Vire.

(2.) FRESNES, a town of France, in the dept. of the Straits of Calais; 7¼ miles NE. of Arras.

FRESNILLO, a town of Mexico, in the prov. of Zacatecas, 40 miles N. of Zacatecas.

FRESNO, 2 towns of Spain: 1. in Old Castile, 5 miles S. of Borgo d'Oñina: 2. in Andalusia, 20 miles N. of Cordova.

(1.) FRESNOY, Charles Alphonso DU, an excellent poet and painter, born at Paris in 1611. He was instructed by Perrier and Simon Vouet in painting, but as soon as he fixed himself at Rome, he made the works of Titian his models. He was, however, more celebrated as a poet than as a painter; and is better known by his incomparable poem *De arte graphica*, than by his performances on the canvass. He bestowed so much pains on it, that he died in 1665, before it was published. It was printed afterward with a French prose translation and notes, by M. de Piles; and was translated into English by Mr Dryden, who prefixed an original preface with a parallel between painting and poetry.

(2.) FRESNOY, a town of France, in the dept. of Oise; 7 miles SW. of Compiègne.

FRESQUEL, a river of France, which runs into the Aude, near Carcassonne.

FRESSELINIS, a town of France, in the dept. of Creuse, on the Creuse, 15 m. NNW. of Gueret.

FRESSENVILLE, a town of France, in the dept. of Somme; 10 miles W. of Abbeville.

FRESSIN, a town of France, in the Straits of Calais, 4½ miles N. of Ham.

FRESTA, a town of Sweden, in the dept. of Upland, 21 miles SE. of Upsal.

(1.) FRESWICK, a river of Scotland, which runs into the Sea near Wigtown.

(3.) FRESWICK, a town of England, in the county of York.

(1.) * FRET. *n. f.* [Of this word the etymology is very doubtful: some derive it from *fretum*, to eat; others from *fretum*, to add; from *fretum*; Skinner more probably from the French *fretiller*: perhaps it comes directly from the Latin *fretum*.] 1. A strait of the sea, where the water by being confined is always rough.—Euripus generally signifies a strait, *fret*, or channel of the sea, between two shores. *Brown.* 2. Any astringent liquors by fermentation, confinement, &c. cause.—Of this river the surface is covered with froth and bubbles; for it runs long up and is still breaking against the stones in its passage. *Addition on Italy.*—The fret, if well governed, like wine upon discharge, discharges itself of heterogeneous mixtures. 3. That stop of the musical instrument, which causes or regulates the vibrations of the string. It requireth good winding of a string will make any note; and, in the top of the frets the higher they go, the less distance between the frets. *Bacon's Nat. Hist.*—

The harp

Had work, and rested not: the sole
And dulcener, all organs of sweet rest
All sounds on fret by string or golden
Temper'd soft tunings, intermix'd
Choral or unison. *Milton's Paradise Lost*

—They are fitted to answer the most perfect harmony: two or three pipes to all the church organ, or to all the strings and lute. *Grew's Conf. Sac.* 4. Work rising, or projecting, in architecture.—The frets of houses, and figures, please; whereas unequal figures deformities. *Bacon's Natural History.*—delight in a prospect well laid out, and with fields and meadows, woods and groves. 5. Agitation of the mind; commotion; temper; passion.—

Calmness is great advantage: he that

Another chase, may warm him at his

Mark all his wand'ring, and enjoy

As cunning fencers suffer heat to tire

The incredulous Phœac, having yet

Drank but one round, reply'd in scorn

You, too weak, the slightest loss

Are on the fret of passion, boil and

Yet then did Dennis rave in fury

I never answer'd; I was not in debt

(2.) FRET, or FRETTE, in architecture

def. 4.) a kind of knot or ornament, consisting of two lists or small fillets variously interwoven, and running at parallel distances to their breadth.

in heraldry, a bearing composed of fretted and variously interlaced. Some *weaver's knot*. See HERALDRY.

in music, (q. v., *def.* 3.) a kind of fretted instruments, particularly bass viols. Frets consist of strings tied round the instrument, at certain distances, within and such notes are to be found.

FRET. *v. a.* [from the noun.] 1. To fret by external impulse or action.—*as well forbid the mountain pines their high tops, and to make a noise by are fretted with the gulls of heav'n.*

Shakespeare.

away by rubbing.—

up them still upon one place, have fretted us a pair of graves

in earth. *Shakespeare's Rich. II.*

beds of rivers, with the washing of the

we were divers times fretted out big

bed. *Abbot.*—Before I ground the object

in pitch, I always ground the patty on

in concave copper, 'till it had done

office; because, if the particles of the

not made to stick fast in the pitch, they

rolling up and down, grate and fret

metal, and fill it full of little holes.

ptics. 3. To hurt by attrition.—

Antony

and dejected; and, by starts,

if fortunes give him hope and fear

he has and has not.

Shak. Ant. and Cleop.

side; to eat away.—It is fret inward,

we bare within or without. *Lev. xiii. 55.*

unful husband, plowing up his ground,

all fret with rust, both pikes and

is,

ty helms under his harrow found.

Hakewill.

into raised work.—

Nor did there want

or freeze, with bossy sculptures grav'n;

was fretted gold. *Milton's Par. Lost.*

gate; to diversify.—

Yon grey lines,

the clouds, are messengers of day.

Shak. Julius Cesar.

to angry; to vex.—

fter part with Mary and with Ruth

you hast; and they that over-ween,

by growing virtues fret their spleen,

ger find in thee, but pity and truth.

Milton.

hou hast fretted me in all these things,

ill recompence thy way upon thine

. xvi. 43.—Such an expectation, cries

ever come to pass: therefore I'll even

and go and fret myself. *Collier.*—In-

friends fret and gall more, and the

them is not so easily obliterated. *Arb.*

Bull.

FRET. *v. n.* 1. To be in commotion;

ed.—No benefits whatsoever shall ever

ay that diabolical rancour, that frets

ts in some hellish breasts, but that it

at in slander and invective. *South.*—

Th' adjoining brook, that purls along

The vocal grove, now fretting o'er a rock,

Now scarcely moving through a reedy pool.

Thom's Summ.

2. To be worn away; to be corroded.—Take a

piece of glove's leather that is very thin, and put

your gold therein, with sal armoniack, binding it

close, and then hang it up: the sal armoniack will

fret away, and the gold remain behind. *Peachment*

on Drawing.—3. To make way by attrition or

corrosion.—These do but indeed scrape off the

exuberances, or fret into the wood, and therefore

they are very seldom used to soft wood. *Moxon's*

Mech. Exer.—It inflamed and swelled very much;

many wheals arose, and fretted one into another

with great excoriation. *Witman.* 4. To be angry;

to be peevish; to vex himself.—They trouble

themselves with fretting at the ignorance of such

as withstand them in their opinion. *Hooker.*—We

are in a fretting mind at the church of Rome,

and with angry disposition enter into cogitation.

Hooker.—

Helpless, what may it boot

To fret for anger, or for grief to moan? *P. Q.*

Their wounded needs

Fret fetlock deep in gore, and with wild rage

Yerk out their armed heels at their dead masters.

Shak. Henry V.

Be lion-mettled, proud, and take no care

Who chafes, who frets, or where conspirers

are.

Shak. Macb.

—His heart fretteth against the Lord. *Prov. xix. 3.*

Rudibras fretting

Conquest should be so long a-getting,

Drew up his force.

Rudibras.

He swells with wrath, he makes outrageous

moan,

He frets, he fumes, he stares, he stamps the

ground.

Dryden.

How should I fret to mangle ev'ry line,

In reverence to the sins of thirty-nine. *Pope.*

FRETEVAL, a town of France, in the dep.

of Loire and Cher, 6 miles NE of Vendôme, and

6 N. of Blois.

* **FRETFUL**, *adj.* [from *fret*.] Angry; peevish; in a state of vexation.—

Thy knotty and combined locks to part,

And each particular hair to stand on end,

Like quills upon the fretful porcupine.

Shak. Hamlet.

Where's the king?

—Contending with the fretful elements;

Bids the wind blow the earth into the sea.

Shak. K. Lear.

—They are extremely fretful and peevish, never

well at rest; but always calling for this or that,

or changing their posture of lying or sitting. *Har.*

Are you positive and fretful;

Heedless, ignorant, forgetful?

Swift.

* **FRETFULLY**, *adv.* [from *fretful*.] Peevishly.

* **FRETFULNESS**, *n. s.* [from *fretful*.] Patience; peevishness.

FRETUN, a town of France, in the dep. of the Straits of Calais, 3 miles S. of Calais.

FRETTON, a town of England, in Norfolk.

FRETOY, a town of France, in the department of the Oise, 5 miles NW. of Noyon.

(1.) **FRETTS**,

(1.) **FRETTS**, *n. f.* in mineralogy, a term used by miners to express the worn side of the banks of the rivers in mine countries, where they search for the load stones or grewtz washed down from the hills, in order from thence to trace out the running of the load up to the mine.

(2.) **FRETTS**, **FREATS**, or **FREITS**. See **FREATS**.

* **FRETTY**. *adj.* [from *fret*.] Adorned with raised work.

FRET-WORK, work adorned with frets. It is sometimes used to fill up and enrich flat empty spaces; but it is mostly practised in roofs, which are fretted over with plaster work.

FREUDENBERG, the name of 3 towns of Germany: viz. 1. in the circle of Bavaria, and Up. Palatinate, 4 miles E. of Amberg: 2. in that of Franconia, and county of Wertheim, on the Main, 8 miles N. of Wertheim, and 28 NE. of Heidelberg: 3. in Westphalia, in Nassau-Siegen, 5 miles WNW. of Siegen.

FREUDENSTADT, a fortified town of Suabia, with a citadel, in the duchy of Wirtemberg; founded in 1600, as an asylum for the persecuted German Protestants. It is seated in the Black Forest, 24 miles SE. of Strasburg, and 36 SW. of Stuttgart. A part of the French army, under Gen. Jourdan, were posted here, on the 7th April 1799, when they attacked the Austrians under the Archduke Charles, but were forced to retreat. Lon. 26. 0. E. of Ferro. Lat. 48. 23. N.

(1.) **FREUDENTHAL**, a town of Silesia, in Troppau, famous for fine linen and good horses; 11 m. SW. of Jagendorf, and 19 W. of Troppau.

(2.) **FREUDENTHAL**, or **BISTRA**, a village of Carniola, seated near the Felsnitz, 5 miles N. of Circuitz.

FREVENSTEIN, a town of Germany, in Stiria, 3 miles NE. of Windisch Weitritz.

FREVENT, a town of France, in the dep. of the Straits of Calais; 7½ miles S. of St Pol, and 6 W. of Arras.

FREVILLE, a town of France, in the dep. of the Lower Seine, 4½ miles NE. of Caudebec.

FREUNDSEERG, a town of Germany in the Tyrolse, 2 miles E. of Schwatz.

FREUNDSEHEIM, a town of Germany, in the Tyrolse, 24 miles W. of Innspruck.

FREYA, **FRIA**, or **FREGGA**, the Venus of the Saxons. See **FREA**. The following German towns appear to have been named from her:

FREYBERG or **FRIBERG**, a town of Up. Saxony in the margravate of Meissen, on the Muldaw; containing 6 churches and about 2000 houses. The environs abound with mines of silver, copper, lead, and tin, which produce above 10,000 rix-dollars annually. It is 18 miles SSW. of Meissen, and 19 WSW. of Dresden. Lon. 31. 1. E. of Ferro. Lat. 50. 07. N.

FREYBERG or **PEIBER**, a town of Moravia, 28 miles ENE. of Pilsen, and 36 E. of Olomitz.

(1.) **FREYBERG**, a town of Silesia, in Schweidnitz, near the Bonnitz, 7 miles W. of Schweidnitz.

(2.) **FREYBERG**, or **FRIBURG**, a town of Up. Saxony, 15 miles S. of Halle, and 4 NNW. of Naumburg.

(3, 4.) **FREYBERG**. See **FRIBURG**, N. 1, 2.

FREYENSTEIN, a territory of the Helvetic

republic, surrounded by the late cantons rich, Bern, Lucerne and Zug; ancient *Kori* and *Wuggenthal*. The Swiss to Count Hapsburg in 1415. It is 24 and 12 broad; and contains about 20,

FREYENSTADT, a town of Bavar Schwarzach; 20 miles SE. of Nuremb NW. of Ratibon. Lon. 29. 8. E. of 49. 9. N.

FREYENSTEIN, a town of Upper miles SE. of Meyenburg.

FREYENTHURN, a town of Carnic Kulp, 7 miles S. of Rudolfsworth.

FREYENWALD, a town of Brandenburg. The natives export corn, b fish, alum, &c. It lies 24 miles NW. and 32 NE. of Berlin.

FREYHAN, a town of Silesia, in Oels

FREYHEIL, a town of Bohemia, in of Koniggratz, 6 miles NW. of Frat

FREYHOFF, a town of Carniola, on 7 miles SW. of Landstrafs.

FREYHUNG, a town of Bavaria, in 10 miles NE. of Sulzbach, and 11 N.

FREYLA, a town of Spain, in Gra

FREYLING, a town of Austria, 4 of Efferding.

(1.) **FREYSINGEN**, or **FRIESINGEN**, a bishopric principality of Germany in B between Munich and Landshut. It co the counties of Ismaning and Werd the lordship of Burgkrain.

(2.) **FREYSINGEN**, the capital of bishopric. See **FRIESINGEN**, N. 2.

(1.) **FREYSTADT**, or **FREUSTADT**, Austria, 82 miles W. of Vienna.

(2.) **FREYSTADT**, a town of Prussia land, 80 miles SW. of Konigsberg.

(3, 4.) **FREYSTADT**; 2 towns of Si the principality of Glogau, 14 miles NE 2. in that of Teschen, 7 miles, NNW.

FREYSTATT, a town and castle of on the Waag, 2 miles NE. of Leopold

FREYSTETT, or **FREYSTAETT**, a to many in the circle of the Upper Rhin NW. of Darmstadt.

FREYUNG, a town of Bavaria, in th of Passau, 14 miles N. of Passau.

FREYVALDE, 2 towns of Silesia: 1. cipality of Grotkau, 15 miles S. of in that of Sagan, 12 miles SW. of Sag

FRIA, or **FREGGA**. See **FREA**.

* **FRIABILITY**. *n. f.* [from *friable*.] being easily reduced to powder.—Har ability, and power to draw iron, are be found in a loadstone. *Locke*.

* **FRIABLE**. *adj.* [from *friable*, French Latin.] Easily crumbled; easily reduced.—A spongy excrecence groweth roots of the tree, and sometime very white, light, and *friable*, wh attack. *Pison's Nat. Hist.*—The the viscera is the most *friable*, and Liked or dissolved. *Johnson's Diet.*

(1.) * **FRIAR**. *n. f.* [A corruption French.] A religious; a brother of f order.—

Holy Franciscan *friar*! brother!

fruits, and pastures: and the canton can send 18,000 men into the field. The total population is above 72,800. The people are Roman catholics. The bishop of Lausanne's diocese extends over this canton, and part of that of Soleure.

(5.) FRIBURG, a celebrated hermitage, in the above canton, (N. 4.) 3 miles from the capital (N. 3.) containing a church and steeple, a vestry, a kitchen, a large hall, two rooms on each side, two pair of stairs, and a cellar, all cut out of the solid rock. The church is 63 feet long, 36 broad, and 22 high. But the most wonderful thing is the steeple, which is 70 feet high above the rock. The chimney of the kitchen is also very surprising, for the passage up is 90 feet in height. It is almost inconceivable how one man, with his servant, could perform so difficult a work, though they were 25 years in executing it.

(6.) FRIBURG. See FREYBURG. N. 2.

(7.) FRIBURG L'EVEQUE, a town of France, in the dept. of Meurthe, 6 miles E. of Dieuze and 7½ W. of Strasburg.

FRIBUS, a town of Bohemia, in the circle of Elbogen, 9 miles W. of Joachimsthal.

* FRICASSEE. *n. f.* [French.] A dish made by cutting chickens or other small things in pieces, and dressing them with strong sauce.—

Oh, how would Homer praise their dancing dogs,

Their stinking cheese, and *fricassée* of frogs!

He'd raise no fables, sing no flagrant lye,

Of boys with custard choak'd at Newberry.

Aug.

* FRICATION. *n. f.* [*fricatio*, Latin.] The act of rubbing one thing against another.—Gentle *frication* draweth forth the nourishment, by making the parts a little hungry, and heating them: this *frication* I wish to be done in the morning. *Bacon's Nat. Hist*—Resinous or unctuous bodies, and such as will flame, attract vigorously, and most thereof without *frication*, as good hard wax, which will convert the needle almost as actively as the loadstone. *Brown's Vulg. Err.*

FRICENTI, or *†* an episcopal town of Naples,

FRICENTY, *§* in Principato Ultra, near the Trpalto; 12 miles NW. of Conza, and 20 SE. of Benevento. Lon. 15. 9. E. Lat. 40. 59. N.

(1.) * FRICTION. *n. f.* [*friction*, Fr. *frictio*, from *frico*, Latin.] 1. The act of rubbing two bodies together.—Do not all bodies which abound with terrestrial parts, and especially with sulphureous ones, emit light as often as those parts are sufficiently agitated, whether the agitation be made by heat, *friction*, percussion, putrefaction, or by any vital motion? *Newton's Optics.* 2. The resistance in machines caused by the motion of one body upon another. 3. Medical rubbing with the fleshbrush or cloths.—*Frictions* make the parts more fleshy and full, as we see both in men and in the currying of horses; for that they draw a greater quantity of spirits to the parts. *Bacon.*

(2.) FRICTION, (*§* 1. *def.* 1) is called also ATTRITION. The phenomena arising upon the friction of divers bodies, under different circumstances, are very numerous and considerable. Mr Hawki-
bee gives a number of experiments of this kind; particularly of the attrition or friction of glass, under various circumstances, the result of which

was, that it yielded light and became heat. All bodies by friction are brought to heat; many of them to emit light; *•* cat's back, sugar, beaten sulphur, sea water, gold, copper, &c. but diamonds, which when briskly rubbed on glass, gold, or the like, yield a light as if of a live coal when blowed by the bellows. *ELECTRICITY, Index.*

(3.) FRICTION, in mechanics, (*§* 1. *def.* 1) is the resistance which arises from the roughness or asperity of the surface of the body moved on, and that of the body moved against it. It is the resistance for such surfaces consisting alternately of eminences and cavities, either the eminences must be raised over those of the other body, or must be both broke and worn off; and it can happen without motion, nor can it be produced without a force impressed. The force applied to move the body is either wholly or partly spent on this effect; and consequently there arises a resistance or friction, which is greater, *ceteris paribus*, as the eminences are greater and the substance the harder: the body, by continual friction, becomes more polished, the friction diminishes. *Amontons, De La Hire, Camus, Muschenbroek, Ferguson, Euler,* and other mechanicians, have made a number of experiments to settle a principle for the determination of the quantity of friction. A successful set of experiments, made on this subject, are those of the rev. Samuel Vince of Cambridge; published in the 75th *Philos. Transf.* p. 165. Mr Emerson, in his *Principles of Mechanics* has also made several remarks on the friction of wood and iron. *MECHANICS.*

(4.) FRICTION, in medicine and surgery, (*§* 3.) is performed with oils, unguents, matters, to relieve, or cure a diseased part. Frictions with mercurial ointment are most useful in venereal cases. The application of friction externally by friction, is preferred to give salivation, to raise a salivation. Friction with a flesh-brush, a linen cloth, or even the hand, contribute greatly to health, in all diseases which impede the circulation of the blood and humors, or the power of the nerves. Persons therefore, of weak nerves and low spirits, should supply the want of other exercise, by spending half an hour, morning and night, in rubbing their whole body, especially their limbs, with a flesh-brush. This is most advantageous when the *primæ viæ* are most relaxed.

FRIDATHORP, a village E. of Kington.

FRIDAW, a town of Germany, 104 miles ESE. of Pettaw, and 104 S. of Vindobona. Lon. 16. 57. E. of Ferro. Lat. 46. 30. N.

(1.) * FRIDAY. *n. f.* [*Frige dæg*, Saxon, sixth day of the week, so named from the Saxon deity.—An' the were not kin, it would be as fair on Friday as Helen is on Shab. *Trail. and Cress.*—

For Venus, like her day, will change her name,
And seldom shall we see a Friday clime.

(2.) FRIDAY, by the Romans was *Veneris*. See VREA, and GOOD-FRIDAY.

(1.) FRIDBERG, a town of Germ.

, with a castle. It was plundered by the
in 1632; and taken by the Austrians in
It lies 4 miles SE. of Augsburg, and 28
of Munich. Lon. 11. 10. E. Lat. 48. 20. N.
FRIDBERG, an imperial town of Germany,
cravia, and in the landgravate of Hesse;
on a mountain, 12 miles NE. of Frankfurt,
ENE. of Mentz. Lon. 8. 46. E. Lat. 50.

FRIDBERG, a town of Germany in Stiria,
5 E. of Preck, and 42 S. of Vienna. Lon.
E. of Ferro, Lat. 47. 32. N.

FRIDBERG, in Silesia. See FRIEDBERG.
FRIDBURG, a town of Germany, in the circle
of Saxony, and province of Thuringia,
on the Unstrut, 30 miles W. of Leipzick.
Lon. 12. 41. E. Lat. 51. 19. N.

FRIDECK, a town of Silesia, 10 miles
of Teichen, and 10 S. of Odelberg.

FRIDECK, a town of Prussia, 12 miles E. of

FRIEDRICHSBURG, a fort on the coast of
, 75 miles from Cape Coast Castle.

FRIEDRICHSE. See FREDERICKSE.

FRIEDWALDE, a town of Germany in
Saxony, 18 m. W. of Eisenach and 35 SSE.
of Jena.

FRIEDWALDE, a town of Westphalia, in
the county of Sayn, 9 miles S. of Siegen.

FRIEDLING, a town of Germany, in Austrian
Saxony, on the Danube; 20 miles SE. of Tubin-
gen and 10 NE. of Constance. Lon. 9. 31. E.
Lat. 48. 11. N.

FRIEDLAND, a town of Bohemia, 55 m.
from Prague. Lon. 15. 15. E. Lat. 52. 4. N.

FRIEDLAND, a town of Prussia, in the prov.
of Posen, 20 m. SE. of Konigsberg.

FRIEDMAN, a town of Hungary, 17 m. NNW.
of Pest.

FRIEDO, a town of Naples, in the province of
Naples, 7 miles ESE. of Potenza.

FRIEDRICHSTEIN, a town of Germany, in
Saxony, 1 mile NW. of Gottschee.

FRIEDSTOL, one of the ancient immunities
belonging to churches. The word signifies a seat,
or place of peace and security, where cri-
minals find safety and protection. Of these
there were many in England; but the most fa-
mous were those at Beverly, and in St Peter's
at York, granted by charter of king Henry I.

FRIEDBERG, or FRIDBERG, a town of
Silesia, 6 miles SW. of Ziegenhals.

FRIEDBERG, or FRIEDENBURG, a town of
Silesia, in the duchy of Jauer, on the Queiss; 11 m.
from Lowerberg, and 14 WNW. of Hirschberg.

FRIEDBERG HOHEN, a town of Silesia, in
the duchy of Schweidnitz; where Frederick the
Great defeated the Austrians, June 4th, 1745. It
lies SW. of Striegau, and 10 NW. of
Schweidnitz.

FRIEDBURG, a Moravian settlement of N.
Germany in Surry county.

FRIEDEBERG, a town of Brandenburg, 46
m. of Frankfurt on the Oder, and 82 ENE.
of Berlin.

FRIEDEBURG, a town of Saxony, in the
county of Mansfeld, 4 m. E. of Gerbstadt.

FRIEDEBURG, a town of Westphalia, in E.

Friesland, 22 miles ENE. of Embden. Lon. 25. 8.
E. of Ferro. Lat. 53. 30. N.

FRIEDELAND, a town of Silesia, in the duchy
of Schweidnitz, 16 miles SW. of Schweidnitz.

FRIEDENSBURG, [D. n. i. e. *the Mansion of
Peace*] a palace of Denmark, near lake Elleron,
4 miles from Fredericksburg, built by Frederick
IV, K. of Denmark, in 1720, when peace was
concluded with Sweden.

FRIEDENSHUTTEN, [i. e. *Tents of Peace*] a
Moravian town and settlement in Pennsylvania,
on the Susquehanna, 24 miles below Tioga Point.
Besides a neat chapel and elegant houses, it con-
tains 13 Indian huts, and 250 acres.

FRIEDERICKSTADT, a town on the W. coast
of Santa Cruz. Lon. 93. 25. W. Lat. 17. 48. N.

FRIEDEWALDE, a town of Silesia, in the
duchy of Niesse, 6 miles S. of Grotkaw.

(1.) FRIEDLAND, a town of Bohemia, in the
circle of Boleslau, 9 miles NE. of Krottau.

(2.) FRIEDLAND, a town of Lusatia, on a canal
of the Spree, 8 miles N. of Lieberose.

(3.) FRIEDLAND, a town of Moravia, in the
circle of Olmutz; 18 miles NNE. of Olmutz.

(4.) FRIEDLAND, a town of Up. Saxony, in
Mecklenburg, 14 miles NE. of New Brandenburg.

FRIEDLINGEN, or FRIDLINGEN, a town and
fort of Suabia, 3 miles E. of the Rhine, and 4 N.
of Balle. Lon. 7. 36. E. Lat. 47. 40. N.

FRIELD, a town of Sweden, in the province
of Smaland, 33 miles NW. of Wexio.

* FRIEND, *n. f. friend*, Dutch; *freund*, Sax.]
This word, with its derivatives is pronounced
friend, *friendly*; the *i* is usually neglected. 1. One joined
to another in mutual benevolence and intima-
cy; opposed to foe or enemy.—

Friends of my soul, you twain

Rule in this realm, and the god's state sustain.

Shakespeare.

—Some man is a friend for his own occasion, and
will not abide in the day of thy trouble. *Eccles.*
vi. 8.—

God's benison go with you, and with those
That would make good of bad, and *friends* of
foes.

Shakespeare.

Wonder not to see this foul extend
The bounds, and seek some other self, a *friend*.

Dryden.

2. One without hostile intentions.—

Who comes so fast in silence of the night?

—A *friend*.

—What *friend*? your name? *Sh. Merch. of Ven.*

3. One reconciled to another: this is put by the
custom of the language somewhat irregularly in
the plural number.—

He's *friends* with Cæsar,

In state of health thou say'st, and thou say'st free.

Shakespeare.

My son came then into my mind; and yet my
mind

Was then scarce *friends* with him. *Sh. Lear.*

If she repent, and would make me a *friend*,
Bid her but send me her's, and we are *friends*.

Greene.

4. An attendant, or companion.—

The king ordains their entrance, and ascends
His regal seat, surrounded by his *friends*. *Æn.*

5. *Favourer*, one propitious.—Aurora riding up.

on Pegasus, sheweth her swiftness, and how she is a *friend* to poetry and all ingenious inventions. *Peackam.* 6. A familiar compellation — *Friend*, how camest thou in hither? *Mat.* xxii. 12.

What supports me, dost thou ask?

The conscience, *friend*, t'have lost mine eyes o'erply'd

In liberty's defence.

Milton.

* *To FRIEND.* *v. a.* [from the noun] To favour; to befriend; to countenance; to support.—

I know that we shall have him well to *friend*.

Shakespeare.

When vice makes mercy, mercy's so extended,
That, for the fault's love, is th' offender *friend*.

ed.

Shakespeare.

* *FRIENDED.* *adj.* Well disposed; inclined to love.—

Not *friended* by his wish to your high person,
His will is most malignant, and it stretches
Beyond you to your friends.

Shakesp.

* *FRIENDLESS.* *adj.* [from *friend*.] 1. Wanting friends; wanting support; without countenance; destitute; forlorn.—

Alas! I am a woman, *friendless*, hopeless.

Shakespeare's H. VIII.

—Woe to him that is alone, is verified upon none
so much as upon the *friendless* person. *South.*—

To some new clime, or to thy native sky,

Oh *friendless* and forsaken virtue fly.

Dryd.

To what new clime, what distant sky,

Forsaken, *friendless*, will ye fly?

Pope.

* 2. *FRIENDLESS MAN.* The Saxon word for him whom we call an outlaw, because he was, upon his exclusion from the king's peace and protection, denied all help of friends.

* *FRIENDLINESS.* *n. f.* [from *friendly*.] 1. A disposition to friendship.—Such a liking and *friendliness* as hath brought forth the effects. *Sidney.* 2. Exertion of benevolence.—Let all the intervals be employed in prayers, charity, *friendliness* and neighbourhood, and means of spiritual and corporal health. *Taylor's Rule of holy living.*

(1.) * *FRIENDLY.* *adj.* [from *friend*.] 1. Having the temper and disposition of a friend; kind; favourable; benevolent.—They gave them thanks, desiring them to be *friendly* still unto them. 2 *Mat.* xii. 31.—

Thou to mankind

Be good, and *friendly* still, and oft return! *Milt.*

How art thou

To me so *friendly* grown above the rest

Of brutal kind? *Milton's Paradise Lost.*

Let the Nassau star in rising majesty appear,

And guide the prosp'rous mariner

With everlasting beams of *friendly* light. *Prior.*

2. Disposed to union; amicable.—

Like *friendly* colours found our hearts unite,
And each from each contract new strength and
light.

Pope.

3. Salutary; homogeneal.—

Not that Nepenthe, which the wife of Thone
In Egypt gave to Jove born Heiæna,
Is of such power to stir up joy as this,
To be so *friendly*, or so cool to thirst. *Milton.*

(2.) * *FRIENDLY.* *adv.* In the manner of friends; with appearance of kindness; amicably.—

Here between the armies,

Let's drink together *friendly*, and embrace;

That all their eyes may bear those tokens

Of our restored love and amity. *Shak. H.*

(3.) *FRIENDLY ISLANDS*, a cluster of islands in the Pacific Ocean, so named by Capt. Cook in 1770 on account of the friendship which appeared to subsist among the inhabitants, and from the courteous behaviour to strangers. Abel Tasman, an eminent Dutch navigator, first touched here in 1643, and gave names to the principal islands. Captain Cook laboriously explored the whole cluster, which he found to consist of more than 60, and left some European plants and animals upon them. (See *COOK*, N° III, § 10.) There are three islands which Tasman saw he named *Amsterdam*, *Rotterdam*, and *Middleburg*. The first is the largest, See *AMSTERDAM*, N° ii. The chief of these islands are *ANNAMOONA*, *TABOO*, *LEFOOGA*, and *LAGOOA*, or *MIDDLEBURG*. See these articles. The natives of these islands seldom exceed the common stature, but are strong and well made. They are generally black about the shoulders; and though the muscular appearance of the men rather conveys the idea of strength than of beauty, several of them are handsome. Most of the women are well proportioned, and some are absolutely perfect models of beauty both in features and figure. But the most remarkable distinction, is the uncommon smallness and delicacy of their fingers. The general colour is a cast deeper than the copper brown; but the natives of *Amsterdam* have a true olive complexion; and some of the women are even a great deal fairer. Their countenances express their natural mildness, being entirely free from that savage keenness which is the mark of most nations in a barbarous state. They are cheerful, and good-natured. There are few natural deformities to be found amongst them. The most common is the tetter or ring-worm, which seems to affect almost one half of them, and is marked with whitish serpentine marks everywhere behind the ears. Captain Cook had the mortification to learn that all the care he took when he first visited these islands, to prevent the venereal disease from being communicated to the inhabitants, had proved ineffectual. But they do not seem to regard it much. As there appeared few signs of its effects, probably the climate, and their way of living, abate its virulence. There are two other complaints frequent amongst them; one of which is an indolent firm swelling, that affects the neck and arms, and increases them to an extraordinary size in their whole length. The other is a tumour of the same sort in the testicles, which sometimes exceeds the size of the two fists. In other respects they seem uncommonly healthy. Their hair is generally straight, thick, and strong, though some have it bushy or frizzled. The natural colour of the men is black; but the greatest part of the men, and some of the women, have it stained of a brown, purple, or orange colour. Some have it cut off on one side of the head only; others have it entirely cut off except a single lock; the women in general wear it short. The men have their beards short; and both men and women strip the hair from the arm-pits. The men are stained from about the middle of the belly to about half-way down the thighs with a deep blue colour. The women have only a few small blue or spots

ed on the inside of their hands. The men circumcised, or rather *supercised*, as the operation consists in cutting off only a small piece of foreskin at the upper part; which is thus incapable of ever after covering the glans. The use of both men and women is the same: a strip of a piece of cloth or matting, about 2½ wide and 2½ long: so as to go once and a half round the waist, to which it is confined by a knot. It is double before, and hangs down like a coat, as low as the middle of the leg. When folded, there is cloth sufficient to draw a wrap round the shoulders. The interior of the wrap wears nothing but a covering made of a narrow piece of bark, which is a narrow piece of bark, passed between the thighs, and round the waist. The use of this is chiefly for the men. The ornaments worn by the women are necklaces, made of the fruit of the tree, and various sweet-smelling flowers, and various *beads*. Others are composed of shells, bones of birds, shark's teeth, &c. hanging loose upon the breast; rings of shells on the fingers; or joined together into bracelets on the wrists. The lobes of the ears are most frequently only one; are perforated with holes, in which they wear cylindrical ornaments about 1 inch long. They bathe in the sea, being sensible that salt water hurt the skin when they bathe in the sea, they compare fresh water poured over them to wash. Those of superior rank use cocoa-nut oil, improves the appearance of the skin. The use of their cloth is wholly confined to the women; as is also that of their ornaments, which are esteemed both for their texture and with many other articles of less note; by which they make vast numbers, and all finished with great taste. The labours of the men are laborious and extensive. Agriculture, fishing, boat-building, fishing, and other labour relate to navigation, are the objects of their industry. Roots and fruits being their principal food, they pay constant attention to agriculture; they have brought to great perfection, and the planters and yams, they observe the seasons, and make the rows every way regular. The coconuts and bread-fruit are scattered about without order, and are not so valuable after they have reached a height. The houses of the lower people are small, and very small; those of the higher are larger and more comfortable. The houses of one of a middling size are about 20 ft. long, 10 broad, and 12 high. The house is, in the interior, a thatched roof, supported by posts. The floor is raised with earth, and covered with strong thick matting, and very clean. A thick strong mat, about 3 ft. long, bent into a semicircle, and set upon the floor, in shape resembling a sander, incloses a place for the master and mistress to sleep in. The rest of the floor, the unmarried men and women sleep upon. If the family be large, there are other rooms adjoining, to which the servants retire at night; so that privacy is much observed. The ornaments they wear in the day serve for their

covering in the night. Their whole furniture consists of a bowl or two, in which they make kava; a few gourds; cocoa nut shells; and some small wooden stools, which serve them for pillows. They display much ingenuity in building and navigating their canoes. The only tools, that they use to construct them, which are very dexterously made, are hatchets, or rather thick adzes, of a smooth black stone that abounds at Toofoa; augers, made of shark's teeth, fixed on small handles, and rasps of a rough skin of a fish, tattered on flat pieces of wood, thinner on one side, with handles. The cordage is made from the fibres of the cocoa-nut husk, which, though above 9 or 10 inches long, they split about the size of a quill, to any length, and roll it up in ball, from which the larger ropes are made by twisting several of these together. The lines that they fish with are as strong and even as the best cores we make. Their other fishing implements are large and small hooks made of pearl shell. Their weapons are clubs of different sorts, spears, and darts. They have also bows and arrows, for shooting birds. The clubs are about two feet long, but only 4 or 5 inches high, and near 4 broad, bending downward in the middle, with 4 strong legs, and circular feet: the whole made of one piece of black or brown wood, neatly polished, and sometimes inlaid with bits of ivory. Yams, plantain, bread-fruit, and coconuts, compose the greatest part of their vegetable diet. Of their animal food, the chief articles are, hogs, fowls, fish, and shell fish; the lower people eat rats. Their food is generally dressed by boiling, and they have the art of making, from different kinds of fruit, several dishes, which Captain Cook's people esteemed very good. When food is served up to the chiefs, it is commonly laid upon green plantain leaves. The women eat with the men; but there are certain ranks amongst them that can neither eat nor drink together. They seem to have no set time for meals. They go to bed as soon as it is dark, and rise with the dawn. Their diversions are chiefly singing, dancing, and music. The dancing of the men has a thousand different motions with the hands, performed with an ease and grace not to be described but by those who have seen them. Most of the men satisfy themselves with one wife. The chiefs, however, have commonly several, though only one is looked upon as the mistress of the family. When any person of rank dies, his body is washed and decorated by women, appointed on the occasion; who, by their customs, must not touch any food with their hands, for many months afterwards; and the length of the time they are thus prohibited, is the greater in proportion to the rank of the chief whom they had washed. The concern of their people for the dead is extraordinary. They beat their teeth with stones, for the sake of a shark's tooth into the head until the blood flows in streams, and thrust boars into the inner part of the thigh, into their sides below the armpits, and through the cheeks into the mouth. But these painful operations are only practised on the death of those most nearly connected. Their long and general mourning proves, that they consider death as a very great evil. And this is confirmed by a very odd custom which they practise to avert

It. They suppose that the Deity will accept of the little finger, as a sort of sacrifice to procure the recovery of their health. They cut it off with one of their stone hatchets. There was scarcely one among ten of them who was not thus mutilated. The inferior people also cut off a joint of the little finger on account of the sickness of the chiefs to whom they belong. They seem to have no idea of future punishment. They believe, however, that they are justly punished upon earth; and therefore use every method to render their divinities propitious. The Supreme Author of all things they call *Kallafootonga*; who, they say, is a female residing in the sky, and directing all the changes of the weather. They believe that when she is angry with them, the productions of the earth are blasted by lightning, &c. and that they themselves are afflicted with sickness and death, as well as their hogs and other animals. They also admit a plurality of deities, though all inferior to *Kallafootonga*. They call *Isi*, or the living principle, *Otooa*; i. e. a divinity or invisible being. The power of the king is unlimited, and the lives and properties of the subjects are at his disposal. The lower ranks of people have no property, nor safety for their persons, but are at the will of their chiefs. When any one wants to speak with the king, he advances and sits down before him with his legs across; a posture to which they are so much accustomed, that any other mode of sitting is disagreeable to them. To speak to the king standing would be accounted a mark of rudeness. Though some of the chiefs may vie with the king in point of possessions, they fall very short in rank, and in certain marks of respect. It is a particular privilege annexed to his sovereignty, not to be punctured nor circumcised, as all his subjects are. Whenever he walks out, every one he meets must sit down till he has passed. The person who is to pay obedience squats down before the chief, and bows his head to the sole of his foot; which, when he sits, is so placed that it cannot be easily come at; and having tapped or touched it with the under and upper side of the fingers of both hands, he retires. The hands, after this application to the chief's feet, until they be washed, must not touch any kind of food. While in this state, they are called *tabou rema*, q. d. *forbidden hands*. Their great men are fond of having women sit beside them all night, and beat on different parts of their body until they sleep; after which they relax a little of their labour, unless they appear likely to awake; in which case they redouble their drumming until they are again fast asleep. These islands lie between 170° and 180° Lon. W. and between 20° and 23° Lat. S.

(1.) * FRIENDSHIP. *n. f.* [*friendship*, Dut.] 1. The state of minds united by mutual benevolence; amity.—There is little *friendship* in the world, and least of all between equals, which was wont to be magnified: that that is, is between superior and inferior, whose fortunes may comprehend the one the other. *Bacon*.—He lived rather in a fair intelligence than any *friendship* with the favourites. *Clarendon*. 2. Highest degree of intimacy.—

My sons, let your unseemly discord cease,
If not in *friendship*, live at least in peace. *Dryd.*

3. Favour; personal kindness.—

His *friendships*, still to few confide
Were always of the middling kind.
—Raw captains are usually sent only
friendship, and not chosen by sufficiency
on Ireland. 4. Assistance; help.—

Gracious, my lord, hard by here
Some *friendship* will it lend you 'gainst
pest;

Repose you there.

Shak

5. Conformity; affinity; correspondence to unite.—We know those colour a *friendship* with each other, and tho incompatible, in mixing together tho which we would make trial. *Dryd. D*

(2.) FRIENDSHIP, (§ 1. def. 1.) may a mutual attachment between two per not merely from the general principle lence, from emotions of gratitude fo ceived, from views of interest, from i fection or animal passion, but from entertained by each of them, that the dued with many amiable and estimab Among the ancients, friendship was highest veneration. Even the charac heroes were not reckoned complete The poets therefore never failed to ori greatest characters with this virtue. CHILLES is represented to have had h ÆNEAS his *Achates*, ORESTES his Nor was their history deficient in exhib instances to what a pitch of heroic n friendship was sometimes carried in re friendships of DAMON and PYTHIAS, us and ARISTOGITON, &c. are univer (See these articles.) Some modern at ticularly Voltaire, and even the late Soame Jenyns, Esq; have alleged it as among the moral precepts of Christiani no-where expressly enjoin private fri Christian Duty. But in answer to been justly observed, that friendship accident of Society, a consequence of o as moral and social beings, than a re regulated and defined by institutions “the precepts of Christianity, thou not directly enjoin it, yet have a dire to form those exalted characters, w capable of true friendship, by incul virtues, which give rise to this gene ment, and are absolutely necessary it.” Besides, the Scriptures afford ample of friendship, carried to the u of perfection of which human nature in the instance of David and Jonath JONATHAN's disinterested attachmen litical rival is unparalleled in the ann kind. Nor is there wanting in the I ven a still higher example. Mr W in a note on his *Translation of Cicero's* ly observes, that “the Divine Founder c tian religion, as well by his own exa the spirit of his moral doctrine, has i couraged but consecrated FRIENDSHIP sentiments, (he says) which Christ en Lazarus, were a peculiar species of t benevolence, with which he was actual all mankind.”—And that emphatical

“principle whom Jesus loved,” repeatedly applied to the apostle John, affords a decisive evidence of the justice of Mr Melmoth’s remark on altered amity” displayed by our Saviour to his peculiar friends; and which Mr Melmoth has finely illustrated in the note, which here only partially quoted.

CA. a town of Portugal, in the province of Alentejo, 12 miles SW. of Outeiro.

MESACH, a town of Brandenburg, in the Mark, 28 miles NW. of Berlin.

MESACH, a town of Carinthia, in the principality of Salzburg, with a strong fort; taken by the French, in March 1797. It is seated on a mountain, 56 miles SE. of Salzburg. Lon. 10° 47' 12" N.

MIEN, a town of Germany, in Stiria, 9 miles SE. of Windischgratz.

MIESINGEN. See **FREYSINGEN**, N° 1. **MESINGEN, FREISENGEN, FREYSINGEN, MINGEN,** a town of Bavaria, capital of the district (N° 1.) seated on a mountain, near the river Isar. It was destroyed in 1116, rebuilt, D. of Bavaria. It has an elegant cathedral and episcopal palace; and lies 17 miles from Munich, and 18 SW. of Landshut. Lon. 48° 20' N.

RIESLAND, or NORTH FRIESLAND, one of the United provinces, now included in the Batavian republic. It was so named from the **Frisons**, and was bounded on the E. by the Ems, which separates it from Groningen; on the S. by Overijssel, on the W. by the Zee, and on the N. by the German ocean. It extends from N. to S. and 23 from E. to W. It is very fertile in corn and pasture; the soil is large, and the cows and sheep prolific. It is divided into three parts; Westergo to the N. and E. and Sevenwadden to the S. The islands of Schelling, Ameland, &c. belonged to the principal towns are Leeuwarden, Franeker, Deekum, Harlingen, and Stavoren, now forms the department of the Ems. **RIESLAND, EAST,** a province of Germany, in the circle of Westphalia, near the German ocean. It is bounded on the S. by the bishopric of Munster, on the E. by the county of Guelders, on the W. by the province of Groningen, and on the N. by the sea, being about 50 miles long, and 30 broad. It belongs to Prussia, formerly called the *county of Emden*. It is very fertile, and feeds a great number of cattle. It was greatly damaged by an inundation in 1717, and the repair of the dykes cost an immense sum. The principal towns are Emden, Leer, Eßens, Whitemunde, and Aurich. **EMDEN, N° 1 and 2.**

RIESLAND, NORTH. See N° 1.

RIESLAND, WEST, a name given to that part of the Batavian republic, lately called North Friesland, more particularly to that part of it which is bounded by Alkmaer, Enckhuysen, and the Texel, and included in the department of the Texel.

NITZ, a town of Germany, in the circle of Saxony, 2 miles E. of Neustadt.

FRIEZE. *n. f.* [*drap de frise*, French.] A warm cloth, made perhaps first in Friesland.

If all the world

Should in a pet of temperance feed on pulse,
Drink the clear stream, and nothing wear but
frieze,

Th’ All-giver would be unthank’d. *Milton.*

The captive Germans of gigantic size,
Are rank’d in order, and are clad in *frieze*.

Dryd. Pref.

—He could no more live without his *frieze* coat
than without his skin. *Guardian.*—

See how the double nation lies,
Like a rich coat with skirts of *frieze*;

As if a man, in making posies,
Should bundle thistles up with roses. *Swift.*

(2.) * **FRIEZE.** *n. f.* [In architecture.]

A large flat member which separates the architrave
from the cornice; of which there are as many
kinds as there are orders of columns. *Harr.*—

No jutting *frieze*,

Buttrice, nor coigne of vantage, but this bird
Hath made his pendant bed, and procreant
cradle. *Shakspeare.*

Nor did their want

Cornice or *frieze* with bossy sculptures grav’d;
The roof was tressed gold. *Milt. Par. Lost.*

—Polydore designed admirably well, as to the
practical part, having a particular genius for
friezes. *Dryd. Dugiel.*

* **FRIEZED.** *adj.* [from *frieze*.] Shagged or
matted with *frieze*.

* **FRIEZELIKE.** *adj.* [*frieze* and *like*.] Resem-
bling a *frieze*.—I have seen the figure of Thalia,
the comick muse, sometimes with an entire head-
piece and a little *friezelike* tower, running round
the edges of the face, and sometimes with a mask
for the face only. *Adelphi on Italy.*

(1.) * **FRIGAT.** *n. f.* [*frigate*, French; *frigate*,
Italian.] 1. A small ship. Ships under 50 guns
are generally termed *frigates*.—The treasure they
sought for was, in their view, embezzled in cer-
tain *frigats*. *Raleigh’s Apology.*—

On high rais’d decks the haughty Belgians
ride,

Beneath whose shades our humble *frigats* go.

Dryden.

2. Any small vessel on the water.—

Behold the water work and play

About her little *frigate*, therein making way.

Spencer’s Fairy Queen.

(2.) **FRIGATES** are usually of two decks, light-
built, designed for swift sailing. When single-
decked, with but one deck, they are called light frigates.
Those mounting from 20 to 44 guns are esteemed
excellent cruisers. The name was formerly known
only in the Mediterranean, and applied to a long
kind of vessel employed in that sea with sails and
cannon. The first were the first who appeared
on the ocean with these ships, equipped for war
as well as for commerce.

FRIGATE-BUILT, *adj.* denotes the disposition
of the decks of such merchant ships as have a de-
scent of 4 or 5 steps from the quarter-deck and
fore-castle into the waist; in contradistinction to
those whose decks are on a continued line for the
whole length of the ship, which are called **GAL-
LEY-BUILT**.

FRIGATOON, a Venetian vessel, commonly
used in the Adriatic, built with a single deck

and without any fore-mast, having only a main mast, mizen-mast, and bow-sprit.

* **FRIGEFACI**ON. *n. f.* [*frigus* and *facio*, Latin.] The act of making cold.

FRIGGA. See **FREA.**

(1.) * **FRIGHT.** *n. f.* [from the verb.] A sudden terrour.—

You, if your goodness does not plead my
cause,

May think I broke all hospitable laws,

To bear you from your palace-yard by night,

And put your noble person in a *fright*. *Dryd.*

(2.) FRIGHT, or TERROR. See FEAR. Sudden fear is frequently productive of very remarkable effects upon the human system. Of this many instances occur in medical writings.—In general, the effects of terror are a contraction of the small vessels and a repulsion of the blood in the large and internal ones: Hence proceed general oppression, trembling, and irregularity in the motions of the heart; while the lungs are also overcharged with blood. Frights often occasion incurable diseases, as epilepsy, stupor, madness, &c. In this way they have killed many, by the agitation into which they have thrown the spirits. We have also accounts of persons absolutely killed by terror, when in perfect health at the time of receiving the shock. Persons ordered to be led to execution, but with private orders to be relieved on the scaffold, have expired at the block without a wound.—Out of many instances of the fatal effects of fear, the following is selected as one of the most singular:—"George Grochantzy, a Polander, who had enlisted as a soldier in the service of the king of Prussia, deserted during the last war. A small party was sent in pursuit of him, and, when he least expected it, surprised him singing and dancing among a company of peasants, in an inn. This event so sudden and so dreadful in its consequences, struck him in such a manner, that, giving a groan and cry, he became altogether stupid and insensible, and was seized without the least resistance. They carried him away to Glogau, where he was brought before the council of war, and received sentence as a deserter. He suffered himself to be led and disposed of, at the will of these about him, without uttering a word, or giving the least sign that he knew what had happened or would happen to him. He remained insensible all the time wherever he was placed, and was wholly possessed with respect to all that was done to him or about him. During all the time that he lay in custody, he neither eat, nor drank, nor slept, nor had any evacuation. Some were employed to keep him in bed; after that he was visited by physicians of all nations, and by some priests; but none could do him good in the smallest degree, without his being more violently agitated. At length, however, he recovered his senses, and was found lying on the ground, surrounded by several soldiers, who were endeavouring to force him up. It was then that he first perceived what had happened to him, and how he was situated. He was informed that he was condemned to death, and that he was to be executed immediately. He was then taken to the scaffold, and there he died without uttering a word.

whether he would. He received his life the same insensibility that he had shewn on occasions; he remained fixed and immovable, his eyes turned wildly here and there without cognizance of any object, and the features of his face were fallen and fixed like those of a corpse. Being left to himself, he passed in this condition, without eating, drinking, or evacuation, and died on the 20th day after he had been some times heard to fetch deep sighs. Once he rushed with great violence on a soldier who had a mug of liquor in his hand, and snatched the mug from him, and having drank the liquor, he with great eagerness let the mug drop to the ground. When a person is affected with terror, the principal endeavour should be to restore tranquillity to its due order, to promote peace, and to allay the agitation of the patient. For these purposes he may drink a little warm chamomile tea, &c. the feet and legs may be put into warm water, the legs rubbed, and warm chamomile tea repeated every six or eight hours, and when the skin is warm, and there is a tendency to perspiration, sleep may be promoted by a gentle opiate. Yet frights have been cured, as well as to cause diseases. Mr. E. mentions agues, gout, and sciatica, thus among the ludicrous effects of fear, the following instance, quoted from a French author, Mr. Andrews in his volume of Anecdotes, illustrates what slight occasions this passion may sometimes excite in a very high degree, in persons the most unlikely to enter into such notions. "Charles Gustavus (the successor of Charles X. of Sweden) was besieging Prague, when a most extraordinary village desired admittance to his tent; and being allowed entrance, in a way of amusing the king, to devour a pig of 100 weight in his presence. The officer of the guard, Kingmarck, who stood by the king's side, who, soldier as he was, had not got over the prejudices of his childhood, hinted to the king that the peasant ought to be executed for ever. 'Sir, said the fellow, with a respectful remark, if your majesty will but order a gentleman to take off his sword and his hat, and let him stand immediately before I begin the banquet (who had, at the head of a company of Swedes, performed wonders against the enemy, and who was looked upon as one of the bravest men of the age), could not this be done especially as it was accompanied by a great and preternatural expansion of the peasant's liver.' With all this saying a veteran suddenly turned round, ran to the peasant, and thought not himself till he arrived at his quarters; where he found the peasant locked up securely, by one of the soldiers of the guard, who had executed his order." The incident is told by Mr. Andrews in his *History of the War of the Succession*, vol. 1. p. 100. The king, however, did not think it necessary to make any further inquiry into the matter, and the peasant was allowed to remain in the tent, and to eat the pig, and to drink the liquor, and to sleep, and to die, as he pleased.

ities. Yet there are evils which we ought
Those that arise from ourselves, or which
or power to prevent, it would be madness
fe, and audacity not to guard against
evils, which we cannot prevent, or could
without a breach of duty, it is manly
urable to bear with fortitude. Insensi-
dancer is not fortitude, no more than
acity of feeling pain can be called pa-
ned to expose ourselves unnecessarily to
orse than folly, and very blameable pre-
. It is commonly called *fool-hardiness*;
ach a degree of hardness or boldness as
fools are capable of. See **FORTITUDE**.
FRIGHT. *v. a.* [*frightan*, Sax.] To ter-
disturb with fear; to shock with fear; to
dismay. This was in the old authours
quently written *affright*, as it is always
the Scripture.—

The herds
strongly clam'rous in the *frighted* fields.
Shakesp. Henry IV.

Such a numerous host
in silence through the *frighted* deep,
ain upon ruin, rout on rout,
ion was confounded. *Milton.*

ubic watch, and of a sword the flame
avage, all approach far off to *fright*,
ard all passage to the tree of life. *Milt.*
exile or danger can *fright* a brave spirit,
sorence guarded,

true rewarded,
be on my self brings a merit. *Dryd. Albion.*
ed *fright* itself with any thing reflected
k, and at a distance: things thus offer-
mind, carry the shew of nothing but
Love.—

not glaring oft with many a broaden'd
b,
its the nations. *Thomson's Autumn.*

FRIGHTEN. *v. a.* To terrify; to shock
—

rugged bear's, or spotted lynx's brood,
the valleys and infect the wood. *Prior.*

FRIGHTFUL. *adj.* [from *fright*.] 1. Ter-
riful: full of terror.—

ay and wayward was thy infancy,
holidays *frightful*, desolate, wild, and
ione. *Shakesp.*

Without aid you durst not undertake
frightful passage o'er the Stygian lake.

Dryden's Æn.
word among women for any thing un-

FRIGHTFULLY. *adv.* [from *frightful*.] 1.
horribly.—This will make a prodigi-
of water, and looks *frightfully* to the
n; 'tis huge and great. *Burnet.* 2. Dis-
not beautifully. A woman's word.—
to her glass; and Betty, pray,

look *frightfully* to-day? *Swift.*

FRIGHTFULNESS. *n. s.* [from *frightful*.]
r of impressing terror.

FRIGID. *adj.* [*frigidus*, Lat.] 1. Cold;
warmth. In this sense it is seldom used
nce.—In the torrid zone the heat would
intolerable, and in the *frigid* zones the

PART I.

cold would have destroyed both animals and ve-
getables. *Cbeyne's Phil. Princ.* 2. Wanting warmth
of affection. 3. Impotent without warmth of bo-
dy. 4. Dull; without fire of fancy.—

If justice Phillip's costive head

Some *frigid* rhymes disbursts,

They shall like Persian tales be read,

And glad both babes and nurses.

Swift.

(2.) **FRIGID ZONE**. See **ZONE**.

(1.) * **FRIGIDITY**. *n. s.* [*frigiditas*, Lat.] 1.
Coldness; want of warmth. 2. Dulness; want
of intellectual fire.—Driving at these as at the
highest elegancies, which are but the *frigidities* of
wit. *Brown's Vulg. Err.*—Of the two extremes,
one would sooner pardon phrenzy than *frigidity*.
Pope. 3. Want of corporeal warmth.—The boil-
ing blood of youth hinders that serenity which is
necessary to serve intemperance; and the *frigidity* of
decrepit age is as much its enemy, by reason of its
dulling moisture. *Glanville's Sermons* 4. Coldness
of affection.

(2.) **FRIGIDITY**. See **IMPOTENCE**.

* **FRIGIDLY**. *adv.* [from *frigidly*.] Coldly;
dully; without affection.

* **FRIGIDNESS**. *n. s.* [from *frigid*.] Coldness;
dullness; want of affection.

FRIGIDO, a river of Italy, in the now restored
Cisalpine republic, which runs through the de-
partment of the Apennines, (i.e. dev. duchy of
Modena,) and falls into the Gulf of Genoa, near
Mala.

FRIGILIANA, a town of Spain, in Granada,
13 miles E. of Velez Malaga.

FRIGNANO, a territory of the Cisalpine re-
public, in the dept. of Panaro, and adjacent duchy
of Modena, comprehending Acquana, Trumano,
Gara, Ronca, Sestola, and some other small towns.

(1.) * **FRIGORIFICK**. *adj.* [*frigoris*, Lat.] Causing cold. A word of in-
science.—*Frigorifick* atoms or particles mean those
nitrous salts which float in the air in cold weather,
and occasion freezing. *Boyer.*

(2.) **FRIGORIFIC PARTICLES**, in physiology,
small particles of matter, which, according to Gal-
lenus and others, being actually and essentially
cold and penetrating other bodies, produce in
them that quality which we call cold. See **COLD**.

FRIKEN, a lake of Sweden in the province of
Warmeland, 40 miles long but narrow.

FRILAZIN, a class or rank of people among
the Anglo-Saxons, consisting of those who had
been slaves, but had obtained their liberty, either
by purchase or otherwise. Though these were
in reality free men, they were not considered as
of the same rank and dignity with those who had
been born free, but were still in a more depen-
dent condition, either on their former masters or
on some new patrons. This custom the Anglo-
Saxons seem to have derived from their ancestors
in Germany, among whom those who had been
made free did not differ much in point of liberty or
importance from those who continued in servitude.
This distinction, between those who have been
born free and those who enjoy freedom by de-
scend from a long race of freemen, still prevails
in many parts of Germany; and particularly in
the original seats of the Anglo-Saxons. Many of

the inhabitants of towns and cities in England, in that period, seem to have been of this class of men, who were in a kind of middle state between slaves and freemen.

* *To FRILL. v. a.* [*frilleux*, French.] To quake or shiver with cold. Used of a hawk; as the hawk *frills*. *Dict.*

FRIMAIRE, [Fr. *i. e.* the fleet or frost month, from *frimas*, hoar frost.] The 3d month in the new French calendar. It begins the 21st of Nov. and ends the 20th of Dec.

* FRINGE. *n. s.* [*friggio*, Italian; *frange*, Fr.] Ornamental appendages added to dress or furniture. It is in conversation used of loose and separate threads.—Those offices and dignities were but the facings or *fringes* of his greatness. *Wotton*.

The golden *fringe* ev'n set the ground on flame,
And drew a precious trail. *Dryden*.

—The shadows of all bodies, in this light, were bordered with three parallel *fringes*, or bands of coloured light, whereof that which was contiguous to the shadow was broadest and most luminous; and that which was remotest from it was narrowest, and so faint as not easily to be visible. *Newton's Opt.*

* *To FRINGE. v. a.* [from the noun.] To adorn with fringes; to decorate with ornamental appendages.—Either side of the bank, *fringed* with most beautiful trees, resisted the sun's darts. *Sidney*.—

Of silver wings he took a shining pair,
Fringed with gold. *Fairfax*.

Here, by the sacred bramble ting'd,
My petticoat is doubly *fring'd*. *Swift*.

FRINGILLA, in ornithology, a genus belonging to the order of passerines. The bill is conical, straight, and sharp pointed. See *Plate CLVIII*. There are no less than 108 species comprehended under this genus, distinguished principally by varieties in their colour. The following are the most noted:

1. FRINGILLA AMANDAVA, the AMADUVADE BIRD, is about the size of a wren. The colour of the bill is of a dull red; all the upper parts are brown, with a mixture of red; the under the same, but paler, the middle of the belly darkest; all the feathers of the upper wing coverts, breast, and sides, have a spot of white at the tip; the quills are of a grey brown; the tail is black; and the legs are of a pale yellowish white. It inhabits Bengal, Java, Malacca, and other parts of Asia; and feeds on millet.

2. FRINGILLA CÆLEBS, the CHAFFINCH, has black limbs, and the wings white on both sides; the 3 first feathers of the tail are without spots, but the 2 chief ones are obliquely spotted. It has its name from its delighting in chaff. This species entertains us agreeably with its song very early in the year, but towards the end of summer assumes a chirping note: both sexes continue with us the whole year. In Sweden, the females quit that country in September, migrate in flocks into Holland, leaving their mates behind; and return in spring. In Hampshire Mr White has observed something of this kind; vast flocks of females with scarcely any males among them. Their nest is almost as elegantly constructed as that of the goldfinch, (N. 5.) and of much the same materials, the inside has the addition of some large sea-

thers. They lay 4 or 5 eggs of a dull whitened and spotted with deep purple. caught in plenty in flight time; but the rarely found, though they build in the trees of all sorts. They make their nest of wool, or any thing they can gather have young ones thrice a year. They bred from the nest, being not apt to learn bird's song, nor to whistle; so that it leave the old ones to bring them up. finches are generally allowed to be the fur length and variety of song, ending in very pretty notes. They are hardy, and almost upon any seeds. They are seldom to disease, but become very lousy, if not with wine two or three times a month.

3. FRINGILLA CANARIA, the CANARY, hath a whitish body and bill, with the others of the wings and tail greenish. See § 3—6. It was originally peculiar to the island to which it owes its name. See CANARIA. Though the ancients celebrate the island for its multitude of birds, they have mentioned any in particular. It is probable that our species was not introduced in till after the second discovery of the island 1402. Belon, who wrote in 1555, is the first to mention these birds: Gesner is the first to name them; and Aldrovand speaks of their varieties, observing that they were very difficult to count of the difficulty attending the bringing from so distant a country, and that they were chased by people of rank alone. They were found on the same spot to which we were indebted for the production of these characters; but they are now become so numerous in our own country, that we are under no necessity of crossing the ocean for them. The Canary will prove fertile with the liskin (N. 12. finch (N. 5.)); but in this case the parent, the most part, proves sterile: the pair best when the hen is the Canary, and not the opposite species. She will also prove fertile with the linnet, yellow hammer, chaffinch, even the house sparrow; but the male Canary will not assilate with the female of any other species; the hen must be always of the same species, and the young generally prove Canaries are said by some to live 15 years, others, 18.

4. FRINGILLA CANNABINA, the GREY POLE, is rather less than the common Canary. It has a blood-coloured spot on the forehead. The breast of the male is tinged with red colour. It is a common fraud in the city of London, when a male bird is distinguished from the female by a red breast, as in this case the feathers are painted, so that the deceit is easily discovered. These birds are frequent on the coasts; and are often taken in flight near London. They are familiar, and cheer up the minutes after they are caught.

5. FRINGILLA CARDUELIS, the GOLDFINCH, with the quill feathers red forwards, and the rest without any spots; the two outer feathers white in the middle, as the rest are all black. The young bird before it moults is greenish; and hence it is termed by the birds

PLATE CLXXXI N° 2

Fig 11
White Fulica.

There is a variety of this species, the London bird-catchers a *cheverel*, manner in which it concludes its jerk. distinguished from the common sort by a streak, or by two, sometimes three, white streaks on the throat. Their note is very sweet, and much esteemed on that account, as well as their great docility. Towards winter, they are in flocks; and feed on various seeds, especially those of the thistle. They are fond of building and often build in apple or pear trees. Their nests are very elegantly formed of fine moss, lined with hair and bents, on the outside; lined first with hair and then with the gossin or the fallow. The hen lays 5 white eggs, with deep purple spots on the upper end; and breeds in the year. When kept in cages they are commonly fed much on hemp-seed which they eat freely, but which is said to make them grow black, and lose both their red and yellow. Goldfinches often attain the age of 10 years. They abound throughout Europe; and are met with in Asia and Africa, but less com-

FRINGILLA DOMESTICA, the SPARROW, has the feathers of the wings and tail brown, variegated with grey and black, and a black streak on the wings. These birds are very voracious, and have 3 broods in the year. They are every where common about our houses; here they build in every place they can find; under the roof, corner of the chimney, or in holes of the wall. They make their nest; generally a little hay ill put together, lined well with feathers; where they lay 4 or 5 of a reddish white colour spotted with brown. They sometimes build in trees, in which they take more pains with the nest; and often take the martins from theirs, to save the trouble of constructing one of their own. Sparrows frequenting only habitations and parts of houses may be said to be chiefly fed from humanity; for in spite of every precaution, they partake with the pigeons, poultry, &c. of what is thrown out to them, grain of all kinds, &c. &c. agreeable to their taste, though they refuse from the kitchen of most kinds. They are familiar but crafty, and do not so easily fall into a snare as many others. In autumn they collect into flocks, and roost in numerous neighbouring trees, when they may be taken in dozens, or caught in great numbers at a bat fowling-net. The flesh is accounted good by many. The sparrow has no song, but chirps or two frequently repeated. This species is found every where throughout Europe; and is met with in Egypt, Senegal, Syria, and the south of Africa and Asia.

FRINGILLA LINARIA, the LESSER RED-POLE, is half the size of the greater red-pole; (see N 12.) it has a rich spot of purplish red on the breast; the breast is of the same colour, but less. The female is less lively in colour; and has a red spot on the breast; and the spot on the tail is of a saffron hue. This species is common in England; and lays 4 or 5 eggs of a bluish green, thickly sprinkled near the blunt end with reddish spots. Mr Pennant mentions an in-

stance of this bird being so tenacious of her nest, as to suffer herself to be taken off by the hand, and when released she would not forsake it. This species is known about London by the name of the *stone red pole*. Whole flocks of them, mixed with the liskin, (see N 12.) frequent places where alders grow, for the sake of picking the catkins: they generally hang like the titmouse, with the back downwards; and in this state are so intent on their work, that they may be entangled by dozens, by means of a twig smeared with birdlime fastened to the end of a long pole. This species seems to be plentiful throughout Europe, from the extreme parts of Russia to Italy. It is very common in Greenland, and was also met with by our late voyagers at Oonalashka. In America it is likewise well known. Hence it seems to be a bird common to all the northern parts of the globe.

FRINGILLA LINOTA, the LINNET, has the bottom of the breast of a fine blood-red, which heightens as the spring advances. These birds are much esteemed for their song. They feed on seeds of different kinds, which they peel before they eat; the seed of the LINUM or flax is their favourite food; from whence the name. They breed among furze and white thorn: the outside of their nests is made with moss and bents, and lined with wool and hair. They lay 5 whitish eggs, spotted like those of the goldfinch.

FRINGILLA MONTIFRINGILLA, the BRANBLING, has a yellow bill tipped with black; the head, hind part of the neck, and back, are black; the throat, fore part of the neck, and breast, pale rufous orange; lower part of the breast and belly white; the quill feathers brown, with yellowish edges; the tail a little forked; the legs grey. This species migrates into England at certain seasons, but does not build. It is frequently found among chaffinches, and sometimes comes in vast flocks. They are also seen at certain times in vast clouds in France, insomuch that the ground has been quite covered with their dung, and more than 600 dozen were killed each night. They eat various seeds, but are particularly fond of beech mast. Their flesh is eaten by many, but is apt to prove bitter. They are said to breed about Luxembourg, making their nests on the tall fir trees, composed of long moss without, and lined with wool and feathers within: the hen lays 4 or 5 eggs, yellowish, and spotted; and the young are fledged at the end of May. This species is found more or less throughout Europe; and is common in the pine forests of Russia and Siberia, but those of the last are darker in colour and less in size.

FRINGILLA MONTELLI, the TWITE, is about the size of a linnet. It has the feathers of the upper part of the body dusky; those on the head edged with ash-colour, the others with brownish red: the rump is pale crimson; the wings and tail are dusky, the tips of the greater coverts and secondaries whitish; the legs pale brown. The female wants the red mark on the rump. Twites are taken in the flight season near London, along with linnets. The name seems to have been taken from their twittering note. The bird-catchers tell at some distance whether there be any twites among linnets, merely from this. The twite is

supposed to breed in the more northern parts of Britain.

11. FRINGILLA SENEGALA, the SENEGAL FINCH, is a very little bigger than the wren. The bill is reddish, edged all round with brown; on the ridge of the upper, and beneath the under mandible, is a line of brown quite to the tip: the upper parts of the body are of a vinaceous red colour; the lower parts, with the thighs and under tail coverts, of a greenish brown; the hind part of the head and neck, the back, scapulars, and wing coverts, are brown; the tail is black; and the legs are pale grey. It inhabits Bengal, and feeds on millet. The natives catch them by supporting a large hollowed gourd, bottom uppermost, on a stick, with a string leading to some covered place, and strewing under it some millet; the little birds, hastening in numbers to pick it up, are caught beneath the trap, by pulling away the stick. The females sing nearly as well as the males. They are familiar, and when once used to the climate, frequently live 5 or 6 years in a cage. They have been bred in Holland.

12. FRINGILLA SPINUS, the SISKIN, has the prime feathers of the wings yellow in the middle, and the four first chief tail feathers without spots; but they are yellow at the base, and black at the points. Mr Willoughby says, that this is a song bird; and that in Suffex it is called the *barley bird*, because it comes to them in barley seed time. It visits these islands at very uncertain times, like the gross-beak, &c. It is to be met with in the bird shops in London; and being rather scarce, sells at a higher price than the merit of its song deserves; it is known there by the name of the *aberduvine*. It is very tame and docile; and is often kept and paired with the canary bird, with which it breeds freely. Dr Kramer informs us, that this bird conceals its nest with great art; and though there are infinite numbers of young birds in the woods on the banks of the Danube, which seem just to have taken flight, yet no one could discover it.

FRINTON, a town in Essex, near Gunfleet.

FRINWALT, a town of Brandenburg, on the Oder, 20 miles N.E. of Berlin.

(1.) FRIO, a river of Spain, in Granada.
(2.) FRIO, CAPE, a promontory of Brasil, in the prov. of Rio de Janeiro. Lon. 41. 31. W. Lat. 22. 54. S.

(1.) * FRIPPERER. *n. s.* [from *frippier*, Fr.] One who deals in old things vamped up.

(2.) FRIPPERERS, or FRIPPIERS, were a regular corporation at Paris, of an ancient standing, and made a considerable figure in that city before the revolution.

* FRIPPERY. *n. s.* [*fripperie*, Fr. *fripperia*, Italian.] 1. The place where old cloaths are sold.—We know what belongs to a *frippery*. *Shak.*—Lairana is a *frippery* of bankrupts, who fly thither from Druma to play their after-game. *Hawel's Vocal Forest.* 2. Old cloaths; cast dresses; tattered rags.—

Poor poet ape, that would be thought our chief,

Whose works are ev'n the *frippery* of wit;

From brocade is become so bold a thief,

As we, the robb'd, leave rage, and pity it.

Ben Jonson.

The fighting place now scannets rage
And all the tackling is a *frippery*.

—Ragfair is a place near the Tower of London where old cloaths and *frippery* are sold. *F*

FRISCHACH, a bay of the Baltic, at the mouth of the Vistula.

FRISHBACHALLEN, a mountain of 3 miles E. of Pruck.

(1.) FRISCH-HAFF, a gulf between EU Konigsberg, separated from the Baltic, by 1 NARUNO, 18 leagues long, and 2 broad, communicating with the Baltic by a narrow passage.

(2.) FRISCH-HAFF, a gulf on the coast of Pomerania, 15 miles long, from E. and 8 broad from N. to S. The Oder flows through it, at the E. end.

FRISCHLIN, Nicodemus, a learned C born at Baling in Suabia, in 1547. At the age of 20, he was made a professor in the Univ. of Tubingen. In 1580, he published an original praise of a country life, with a paraphrase of Virgil's Eclogues and Georgics, in which he made such severe remarks on some courtiers that he threatened his life. This led him to retire to his estate in Carniola, and afterwards to discontinue his studies in Germany: but at last his enemies got him up in Wirtemberg castle, from whence aiming to escape he fell down from a great height among the rocks, and was killed on the spot. He wrote also a Latin grammar, of geometry, and many poems, comedies and tragedies.

FRISCH-NEURUNG, a narrow strait of 1 Prussia, between the Baltic and Frisch-Haff, 18 leagues long, and hardly 2 broad.

FRISEI, } or FRISONES, an ancient
FRISII, } of Germany, so called either
FRISIONES, } their ardent love of freedom from the fresh and unbroken lands they occupied. Tacitus divides them, from their extent of territory into

1. FRISIONES MAJORES, situated on the Rhine and the Ems; and

2. FRISIONES MINORES, occupying the lakes lying between the channel of the Rhine.

* FRISK. *n. s.* [from the verb.] A frolic of wanton gaiety.

* To FRISK. *v. n.* [*frizarre*, Ital.] 1. To skip.—Put water into a glass, and with your finger, and draw it round about the lip of the glass, pressing it somewhat hard; and after doing it some few times about, it will make a fine dew: I have seen the fish fall a *frisking* in the net. *L'Estrange.* Whether every one hath experimented the pleasant intrusion of some *frisking* ideas, thus importune the understanding, and hinder from being better employed, I know not.
2. To dance in frolick or gaiety.—

We are astwin'd lambs, that did *frisk* in
And bleat the one at the other: what we knew
Was innocence for innocence; we knew not
The doctrine of ill doing. *Shak. Winter's Tale.*

About them *frisking* play'd
All beasts of th' earth. *Milt. Paradise Lost.*

—A wanton better *frisked* up and down in
dow at ease and pleasure. *L'Estrange.*

h the quick motions of the *frisking* tail,
rve their fury with the rushing male.

Dryden's Virgil.

ccbus thro' the conquer'd Indies rode,
its in gambols *frisk'd* before their ho-
t god.

Dryden.

o the mountains airy tops advanc'd,
sing satyrs on the summits danc'd.

Addison.

Those merry blades,
it under Pindus' shades.

Prior.

its at the sound of an organ, and yet
and *frisk* at the sound of a bagpipe.

Bull.—

enters thus, in Borneo's isle,
h a monkey by a wile,
nick animal amuse;
ace before him gloves and shoes;
when the brute puts aukward on,
gility is gone:

to *frisk* or climb he tries:

ation seize the grinning prize. *Swift.*
KER. *n. f.* [from *frisk*.] A wanton; one
ot or settled.—

I will wear this, and now I will wear that;
will wear I cannot tell what:

fashions be pleasant to me:
an a *frisker*, all men on me look;
ould I do but let cock on the hoop?

Camden.

IKINESS. *n. f.* [from *frisk*.] Gaiety;
A low word.

IKY *adj.* [*frisque*, Fr. from *frisk*.] Gay;
low word.

INES. See FRISH.

IT, a town of Germany, in the bishop-
ater, 14 miles SW. of Oldenburg, and
Minster. Lon. 24. 4. E. of Ferro.

RIT. *n. f.* [among chymists.] Ashes or
or tried together with sand. *Ditt.*

r, or FRIT, in the glass manufacture, is
r or ingredients whereof glass is to be
en they have been calcined or baked in a
A salt drawn from the ashes of the plant
tern or other plants mixed with sand or
baked together, makes an opaque mass,
glassmen *frit*; probably from the Italian
o fry; or because the *frit* when melted,
umps, like fritters, called by the Italians
rit, by the ancients, was called *ammoni-*
um, sand, and *nitre*; under which
thus described by Pliny: Fine sand
Vulturnian sea, mixed with three times
ity of nitre, and melted, makes a mass
monitrum, which being rebaked makes

. Frit, Neri observes, is only the calx
terials which make glass; which though
be melted, and glass be made, with-
calcining them, yet it would take much
. This calcining, or making of frit, serves
nd incorporate the materials together,
aporate all the superfluous humidity.
once made, is readily fused and turned
. There are 3 kinds of frits: 1. The
t, or that for crystal metal, made with
verine and sand: 2. The ordinary frit,
bare ashes of pulverine or barilla, with-

out extracting the salt from them. This makes
the ordinary white or crystal metal. 3. The frit
for green glasses, made of common ashes, without
any preparation. This last requires 10 or 12
hours baking. The materials in each are to be
finely powdered, washed, and feared; then e-
qually mixed, and frequently stirred together in
the melting pot. See CRYSTAL, and GLASS.

(1.) * FRITH. *n. f.* [*fretum*, Lat.] 1. A strait
of the sea where the water being confined is
rough.—

What desp'rate madman then would venture
o'er

The *frith*, or haul his cables from the shore?

Dryden's Virgil.

Batavian fleets

Defraud us of the glittering finny swarms

That heave our *friths*, and crowd upon our
shores.

Thomson.

2. A kind of net. I know not whether this sense
be now retained.—The Wear is a *frith*, reaching
through the Ose, from the land to low water
mark, and having in it a bunt or cod with an eye
hook; where the fish entering, upon their coming
back with the ebb, are stopt from issuing out a-
gain. *Carew.*

(2.) FRITH, (§ 1. *def.* 1.) usually signifies the
opening of a river into the sea; such are the Frith
of Forth, or of Edinburgh, the Frith of Clyde,
Moray Frith, &c.

(3, 4.) FRITH, in geography, 2 English villages:
1. in Kent. 2. in Middlesex, near Hendon.

FRITILLARIA, FRITILLARY; a genus of the
monogynia order, belonging to the hexandria class
of plants; and in the natural method ranking un-
der the 10th order, *Crocovite*. The corolla is
hexapetalous and campanulate, with a nectarife-
rous cavity above the heel in each petal; the sta-
mina are as long as the corolla. There are 5 spe-
cies, all bulbous-rooted flowery perennials, pro-
ducing annual stalks from about one foot to a yard
or more high, terminated by large, bell-shaped,
lilaceous flowers, of a great variety of colours.
They are all propagated by offsets, which they
furnish abundantly from the sides of their roots,
and which may be separated every second or third
year. They are hardy plants, and will thrive in
ny of the common borders.

* FRITILLARY. *n. f.* [*fritillaire*, French.] A
plant. *Miller*

FRITILLUS, a dice-box. See DICE-BOX, § 2.

* FRITINANCY. *n. f.* [from *fritinnio*, Lat.]
The scream of an insect, as the cricket or cicada—
The note or *fritinancy* thereof is far more shrill
than that of the locust, and its life short. *Brown's*
Vulgar Err.

FRITTENDEN, a village in Kent.

* FRITTER. *n. f.* [*friture*, Fr.] 1. A small
piece cut to be fried.—

Maids, *fritters* and pancakes now see ye make,
Let Slut have one pancake for company sake.

Tusser.

2. A fragment a small piece.—Sense and putter!
have I lived to stand in the taunt of one that
makes *fritters* of English! *Shak. Merry Wives of*
 Windsor—If you strike a solid body that is brittle
as glass or sugar, it breaketh not only where the im-
mediate force is, but breaketh all about into shivers
and

and *fritters*; the motion, upon the pressure, searching all ways, and breaking where it findeth the body weakest. *Bacon's Nat. Hist.*—

The ancient errant knights

Won all their ladies' hearts in fights;

And cut whole giants into *fritters*,

To put them into amorous twitters. *Hudib.*

3. A cheesecake; a wig. *Ainsworth.*

* *To FRITTER.* *v. a.* [from the noun.] 1. To cut meat into small pieces to be fried. 2. To break into small particles or fragments.—

Joy to great chaos! let division reign!

My racks and tortures soon shall drive them hence,

Break all their nerves and *fritter* all their sense.

Dunciad.

How prologues into prefaces decay,

And these to notes are *fritter'd* quite away.

Dunciad.

FRITZLAR, a town of Germany, in Hesse-Cassel, on the Eder, 13 miles SSW. of Cassel. Lon. 26. 41. E. of Ferro. Lat. 50. 0. N.

FRIULANI, the people of **FRIULI**.

(1.) **FRIULI**, a province of Maritime Austria, in the ci-devant republic of Venice, bounded on the N. by Tirol and Carinthia; E. by Carniola and Gradisca; S. by the Adriatic, and W. by the Trevisan, Feltrin, and Bellunese. According to Dr Oppenheim, it is 55 miles long, 65 broad, and 263 in circumference; containing 4 cities, 20 towns and boroughs, and 600 villages. The country is partly level, partly mountainous. The former is very fertile, producing all kinds of corn, wine, fruits, &c. but the mountains produce only timber and game; and the roads through them are truly terrific, being in many places hardly passable, either on foot or on horseback. The chief rivers are the Tagliamento, Meduna, Cellina and Stella. Cattle are numerous, and the culture of silk is so extensive, that 1000 cwt. are annually produced. The population in 1581, was only 196,510: in 1735 it had arisen to 342,158; and in 1795 to 365,512. The inhabitants called *Furlani* or *Friulani*, are reckoned, says Dr Oppenheim, the *wildest* in Italy, tho' we should suppose they cannot exceed the Calabrians in barbarity. They speak a dialect resembling the ancient French, widely differing from both the modern Italian and German. This country was called by the Romans **FORUM JULII**. It was taken from the Lombards by Charlemagne, but belonged to the Venetians from 1420 to 1797. It is divided into the dioceses of Udina and Concordia. Udina is the capital.

(2.) **FRIULLI**, **CIVIDAD**, or **CIVIDAL DI**. See **CIVIDAD**, N° 5. This town, anciently called **FORUM JULII**, is reckoned the 2d capital of the above province, (N° 1.) and contained 400 inhabitants, in 1795.

* **FRIVOLOUS.** *adj.* [*frivulus*, Lat. *frivole*, Fr.] Slight; trifling; of no moment.—It is *frivolous* to say we ought not to use bad ceremonies of the church of Rome, and presume all such bad as it pleaseth themselves to dislike. *Hooker.*—These seem very *frivolous* and fruitless; for by the breach of them, little damage can come to the commonwealth. *Spenser.*—

She tam'd the brinded lioness,

And spotted mountain pard; but set at nought

The *frivolous* bolt of Cupid. *Milton.*

Those things which now seem /
flight,

Will be of serious consequence to

. When they have made you once ri

—All the impeachments in Greece agreed in a notion of being concerned. honour, to condemn whatever perjured, however *frivolous* the article, ver weak the proofs. *Swift.*—I will any mistake, and do not think myself answer every *frivolous* objection. *Art*

* **FRIVOLOUSLY.** *adv.* [from *frivolously*; without weight.

* **FRIVOLOUSNESS.** *n. s.* [from *frivolously*; Want of importance; triflingness.

(1.) **FRIZE**, in architecture. See 1. and **FRIEZE**, § 2.

(2.) **FRIZE**, in commerce. See **F** Of frizes, some are crossed, others number are chiefly of English manufacture of Irish.

FRIZER, *n. s.* See next article.

FRIZING OF CLOTH, a term in manufactory, applied to the forming of stuff into a number of little hard bunnences, covering almost the whole of. Some cloths are only frized on the back as black cloths; others on the right side as blue and mixed cloths, ratteens, &c. Frizing may be performed two ways: the first, with the hand, by two workmen, with a kind of plank that serves for a frizing table. The other, by a mill, worked either by a horse; and sometimes by men. The former is deemed the better way; as, the motion is more uniform and regular, the little knobs more equably and regularly. The disposition of this useful machine is as follows: The parts are the **FRIZER**, or *crisper*, the *roller*, and the *drawer*, or *beam*. The two equal planks or boards, each about 10 or 15 inches broad; differing only in this, that the frizing table is lined or covered with a kind of woollen stuff, of a rough sturdy nap; and the *roller* is incrustated with a kind of cement, glue, gum arabic, and a yellow sand. The *aquavitæ*, or urine. The *beam* is thus called, because it draws the stuff between the frizer and the frizing table. The *roller*, beset all over with little points or ends of wire, like those of a carding of wool. The disposition of the machine are thus: The table stands on four legs, and bears or sustains the cloth to be frized. The cloth is laid with that side uppermost on which it is to be raised; over the table is placed a roller at such a distance from it as to give room for the stuff to be passed between them: so that the *roller*, having a very slow semicircular motion, drawing the long hairs or naps of the cloth into little knobs or burrs; at the same time, the *drawer*, which is continually drawing away the stuff from under the roller, winds it over its own points. All that has to do while the machine is a-going, is to draw the stuff on the table, as fast as the *roller* draws it off, and from time to time to take

points of the drawer. The design of having a table lined with stuff of a short nap, is that it may detain the cloth on the table and the frizer long enough for to be formed, that the drawer may not run too readily, which must otherwise be, as it is not held by any thing at the back.

It is unnecessary to say any thing particular of the manner of frizing stuffs with the aim of the workmen to imitate the curl they can with their wooden instrument, square, and circular motion of the mallet. We need only add, that their frizer is but three feet long, and one broad; and that to curl more easily, they moisten the stuff, with water mingled with whites of egg.

FRIZLE. *v. a.* [*friser*, Fr.] To curl in like nap of frieze.—

Th' humble shrub
Lies, with *frizled* hair implicit. *Milton.*
frizled and curled their hair with hot iron-
will.—

'd my shoe, and swear
I spy'd this yellow *frizled* hair. *Gay.*

FRISLER. *n. s.* [from *frizzle*.] One that curls.

adv. [of *from*, Saxon.] 1. Backward; re-

It is only used in opposition to the word *from*, backward and forward, *to* and *from*. The Carthaginians having spoiled all Spain, root that were affected to the Romans; and the having recovered that country, did cut it favoured the Carthaginians: so betwixt *to* and *from*, there was scarce a native left. *Spenser.*—

When a heap of gather'd thorns is cast,
Now *from*, before th' autumnal blast,
Or clung, it rolls around the field. *Pope.*
contraction of *from*; not now used.—

Turn round like grindstones,
They dig out *from* the delves,
Their bairns bread, wives and selves. *Yonf.*

FRONIUS, John, a famous and learned printer, 16th century, born at Hamelburg in France, studied in the university of Basil, where he had great reputation for learning, and set up a printing-house in that city, was the first German printer who brought that admirable degree of perfection. Being a man of nobility and piety, he would never, for profit, suffer libels or any thing that might hurt the reputation of another, to go thro'

The great character of this printer, was his principal motive which induced Erasmus to re-
print, in order to have his own works printed
A great number of valuable books were
printed by him with care and accuracy. He died
Erasmus wrote his epitaph in Greek and
John Frobenius left a son named Jerome
and a daughter married to Nicholas E.
who, joining in partnership, continued
his printing-house with reputation, and
correct editions of the Greek Fathers.

FORBISHER, or **FORBISHER**, Sir Martin,
an navigator and sea officer in the 16th
born at Doncaster in Yorkshire, and from
brought up to navigation. He was the

first Englishman who attempted to find a NW.
passage to China, and in 1576, he sailed with two
barks and a pinnace for that purpose. In this
voyage he discovered a cape, to which he gave
the name of *Queen Elizabeth's Foreland*, and the
next day discovered a strait to which he gave his
own name. (See § 2.) This voyage proving un-
successful, he attempted the same passage in 1577;
but discovering some ore in an island, and his
commission directing him only to search for ore,
he returned to England with it. He sailed again
with 15 ships and a great number of adventurers,
to form a settlement; but being obstructed by the
ice, and driven out to sea by a violent storm, they,
after encountering many difficulties, returned
home, without making any settlement; but with
a large quantity of ore.—He afterwards command-
ed the *Aid* in Sir Francis Drake's expedition to the
West Indies, in which St Domingo, Carthagena,
and Santa Justina, in Florida, were taken and
sacked. In 1588, he bravely exerted himself
against the Spanish armada, when he commanded
the *Triumph*, one of the largest ships in that ser-
vice: and as a reward for his distinguished brave-
ry, received the honour of knighthood, from the
lord high-admiral at sea. He afterwards com-
manded a squadron which cruised on the Spanish
coast; and in 1592, took two valuable ships and a
rich carrack. In 1594 he was sent to the assistance
of Henry IV. king of France, against a body of the
Leaguers and Spaniards, who had strongly en-
trenched themselves at Croyzon near Breff; but
in an assault upon that fort, on the 7th Novem-
ber, he was unfortunately wounded with a ball, of
which he died soon after he had brought back the
fleet to Plymouth, and was buried in that town.

(2.) **FORBISHER'S STRAITS**, a narrow sea, S.
of Cape WASHINGTON; W. of Davis's Strait, and
N. of Cape Farewell in West Greenland. Lon.
from 65. to 70. W. Lat. between 61. 50. and 63.
20. N.

* **FROCK.** *n. s.* [*froc*, French.] 1. A dress; a
coat.—

That monster, custom is angel, yet in this,
That to the use of actions, fair and good,
He likewise gives a *frock* or livery,

That aptly is put on. *Shak. Hamlet.*

Chalybeat temper'd steel, and *frock* of mail
Adamantean proof. *Milton's Agon.*

2. A kind of close coat for men.—

I strip my body of my shepherd's *frock*.

Dryden.

3. A kind of gown for children.

FRODINGHAM, or } a town of Yorkshire, 36
FRODLINGHAM, } miles E. of York, and
194 N. of London. Lon. 0. 12. W. Lat. 53. 56.
N.

FRODSHAM, a town of Cheshire, noted for
its ancient castle. It has a stone bridge over the
Weaver, near its conflux with the Mersey, and a
harbour for ships of good burden. By the late in-
land navigation, it has communication with the ri-
vers Dee, Ribble, Darwent, Ouse, Trent, Severn,
Humber, Thames, Avon, &c. which navigation, in-
cluding its windings, extends above 500 miles, in the
counties of Lincoln, Nottingham, York, Lancas-
ter, Westmoreland, Stafford, Warwick, Leicester,
Oxford, Worcester, &c. Frodsham is 10 miles
NW.

NE. of Chester, and 182 NNW. of London. Lon. 2. 58. W. Lat. 53. 20. N.

(1.) * **FROG**. *n. f.* [*fragga*, Sax.] 1. A small animal with four feet, living both by land and water, and placed by naturalists among mixed animals, as partaking of beast and fish; famous in Homer's Poem. There is likewise a small green frog that perches on trees, said to be venomous. —Poor Tom, that eats the swimming *frog*, the toad, the tadpole. *Shak. King Lear*. —Auster is drawn with a pot or urn, pouring forth water, with which shall descend *frogs*. *Peacham on Drawing*. 2. The hollow part of the horse's hoof.

(2.) **FROG**, in zoology, § 1, *def.* 1. See **RAMA**.

(3.) **FROG**, in geography, a town of the United States in Georgia; 6 miles W. of Tuglecoo.

(1.) * **FROGBIT**. *n. f.* [*frog* and *bit*.] An herb. *Ainsworth*.

(2.) **FROGBIT**. See **HYDROCHARIS**.

FROGES, a town of France, in the dept. of I-sere, 15 miles WNW. of Grenoble.

(1.) * **FROGFISH**. *n. f.* [*frog* and *fish*.] A kind of fish. *Ainsworth*.

(2.) *The FROGFISH* is a very singular animal of Surinam, of which a figure is given by Mr Edwards, in his *History of Birds*, Vol. I. There is no specimen in the British museum, nor in any private collection, except that of Dr Fothergill. It was brought from Surinam in South America. Frogs, both in Asia and Africa, according to Merian, change gradually from fishes to frogs, as those in Europe; but after many years revert again into fishes, though the manner of their change has never been investigated. In Surinam these fishes are called **JAKJES**. They are cartilaginous, of a substance like our mustela, and exquisite food; they are formed with regular vertebræ, and small bones all over the body divided into equal parts; are first darkish, and then grey: their scales make a beautiful appearance. Whether this animal is, in its perfect state, a species of frog with a tail, or a kind of water lizard, Mr Edwards does not pretend to determine; but observes, that when its size is considered, if it should be deemed a tadpole at first produced from spawn, and in its progress towards a frog, such an animal, when full grown, if it bears the same proportion to its tadpole as those in Europe do, must be of enormous size; for our full-grown frogs exceed the tadpoles at least 50 times. See a reduced figure on *Plate CLVIII*.

* **FROGRASS**. *n. f.* [*frog* and *grass*.] A kind of herb.

FROG-LAKE, a lake of N. America. Lon. 91. 50. W. of Greenwich. Lat. 53. 15. N.

* **FROGLETTUCE**. *n. f.* [*frog* and *lettuce*.] A plant.

FROHBURG, a town of Saxony, on the Wihra, 5 miles SSE. of Perma.

FROHENS *le Grand*, a town of France, in the dept. of Somme, 6 miles NW. of Doullens.

FROHNSDORF, a town of Germany in Upper Saxony, 7 miles SE. of Weissenfee.

FROHNSBURG, a town of Germany, in Austria, 1 mile S. of Hardegg.

FROJAN, a town of Spain in Galicia, 22 miles NNE. of Orense.

FROJED, a town of Sweden, in W. Gothland, 7 miles SE. of Finspång.

FROILA I, K. of Spain, succeeded Alphonso I. in 757, made several good opposed the Moors. In 760, he defeated the Moors under Omar; but sullied his glory by his brother Vemazan; and was himself by his other brother Aurelius.

FROILA II, succeeded his brother 923, but proved a barbarous tyrant, the Castilians revolt. He died of the plague.

* **FROISE**. *n. f.* [from the French] the pancake is crisped or crimped in a kind of food made by frying bacon in a pancake.

FROISSARD, or } John, an eminent
FROISSART, } and poet, born

in 1337. He was canon and treasurer in Hainault. His chief work is a history of the transactions in France, Spain and Italy from 1326 to 1400, which is reckoned very valuable. The best edition is that of Lyons in 1559. Sleidan abridged it, and Morel continued it down to 1466. Froissart resided at the court of Q. Philippa, wife of Edward III. He has been accused of partiality to the English, but the late Lord Gardenston, in his *English Historians*, prefers him to his contemporaries. He died about 1410.

FROISSY, a town of France, in the dept. of Oise, 5 miles SSW. of Breteuil.

(1.) * **FROLICK**. *adj.* [*vrolijck*, Dutch] full of levity; full of pranks.—

We fairies, that do run
By the triple Hecate's team,
From the presence of the sun,
Following darkness like a dream,
Now are *frolick*. *Shak. Midf. Ni.*

Whether, as some sages sing,
The *frolick* wind that breathes the
Zephyr with Aurora playing,
As he met her once a Maying;
There on beds of violets blue,
And fresh-blown roses wash'd in dew,
Fill'd her with thee a daughter fair
So buxom, blithe, and debonnaire.

Who ripe, and *frolick* of his full
Roving the Celtick and Iberian field
At last betakes him to this ominous

The gay, the *frolick*, and the lewd.

(2.) * **FROLICK**. *n. f.* [from the verb] a wild prank; a flight of whim and levity.

He would be at his *frolick* once
And his pretensions to divinity.

—Alcibiades, having been formerly
like *frolicks* and excursions, was im-
puted of this. *Swift*.—

While rain depends, the penfive
Her *frolicks*, and pursues her tail

* *To FROLICK*, *v. n.* [from the verb] to play wild pranks; to play tricks of levity.—Manly spirit and genius play with words, nor *frolicks* the capricious
imagination. *Glazebrook*.—

Then to her new love let her go
And deck her in golden array;

Be silent at every fine show,
And *frolick* it all the long day.

OLICKLY. *adv.* [from *frolick*.] Gaily;

OLICKSOME. *adj.* [from *frolick*.] Full gaiety.

OLICKSOMELY. *adv.* [from *frolick/some*.] Wild gaiety.

OLICKSOMENESS. *n. s.* [from *frolick*.] Wildness of gaiety; pranks.

LOIS, a town of France, in the department d'Or, 21 miles NW. of Dijon.

FROM. *prep.* [*fram*, Saxon and Scottish.]

5; noting privation.—
ur fighting Zulima, this very hour,
aketenthousand subjects *from* your power.

Dryden.
fettens one the barking porter ty'd,
ook him trembling *from* his sov'reign's side.

Dryden.
rissa drew, with tempting grace,
edg'd weapon *from* the shining case. *Pope.*
ng reception.—

at time would spare *from* steel receives its
ate. *Pope.*

ng procession, descent, or birth.—

is the hard and stubborn race of man
animated rock and flint began. *Blackmore.*

ong began *from* Jove. *Dryden.*
ceeding kings rise *from* the happy bed.

Irene.
ng transmission.—
messengers *from* our sister and the king.

Shak.
ng abstraction or vacation.—

I shall find time
his enormous state, and seek to give
their remedies. *Shak. King Lear.*

is following; noting succession.—These
we must examine *from* first to last, to find
was the form of the earth. *Burnet's The-*
bid her *from* time to time be comforted.
Spectator. 7. Out of; noting emission.

When the most high
Father, *from* his secret cloud
in thunder utter'd thus his voice *Milt.*
pierc'd with pain the shook her haugh-
head,

from her inward soul, and thus she said.
Dryden's Æneid.

progress from premisses to inferences.
jection be not removed, the conclusion
nce *from* the time past to the time pre-

ot be found and perfect. *Bacon's War-*
s.—This is evident *from* that high and

orality, which shined forth in some of
it heathens. *South.* 9. Noting the place
from whom a message is brought.—The
ming, and I must speak with him *from*

—How now, Fluellan, cam'st thou *from*
? *Shak.* 10. Out of; noting extraction.

high Mænia's rocky shores I came,
r descent; Acætes is my name. *Ovid.*

se of. Noting the reason or motive of
effect.—

are good, but *from* a nobler cause;
our own knowledge, not *from* nature's

rs. *Dryden.*
celebrates the glory of God *from* the con-
of the greatness of his works. *Tillotson.*

Psalm I.

We sicken soon *from* her contagious care;
Grieve for her sorrows, groan for her despair.

Prior.
—Relaxations *from* plenitude is cured by spare
diet, and *from* any cause by that which is contra-
ry to it. *Arbutnot on Aliments.* 12. Out of.
Noting the ground or cause of any thing.—

By the sacred radiance of the sun,
The mysteries of Hecate, and the night;
By all the operations of the orbs,

From whom we do exist, and cease to be,
Here I disclaim all my paternal care. *K. Lear.*

—They who believe that the praises which arise
from valour are superiour to those which proceed

from any other virtues, have not considered.
Dryden's Virgil.—What entertainment can be rais-

ed *from* so pitiful a machine? We see the success
of the battle *from* the very beginning. *Dryden.*—

'Tis true *from* force the strongest title springs,
I therefore hold *from* that which first made kings.

Dryden.

13. Not near to: noting distance.—
His regiment lies half a mile at least
South *from* the mighty power of the king. *Shak.*

14. Noting separation or recession.—
To die by thee, were but to die in jest;
From thee to die, were torture more than death.

Shak.
Hast thou beheld, when *from* the goal they start,
The youthful charioteers with heaving heart,

Rush to the race, and, panting, scarcely hear
Th' extremes of fev'rish hope and chilling fear.

Dryden.

15. Noting exemption or deliverance.—
From jealousy's tormenting strife,
For ever be thy bosom freed. *Prior.*

16. Noting absence.—
Our father he hath writ, so hath our sister,
Of diff'rences, which I best thought it fit

To answer *from* our home. *Shak. King Lear.*

17. Noting derivation.—
I lay the deep foundations of a wall,
And Enos, nam'd *from* me, the city call. *Æt.*

18. Since. Noting distance from the past.—The
flood was not the cause of mountains, but there
were mountains *from* the creation. *Raleigh's Hist.*

—I had, *from* my childhood, a wart upon one of
my fingers. *Bacon's Natural Hist.*—The other had

been trained up *from* his youth in the war of Flan-
ders. *Clarendon.*—

The milk of tygers was his infant food,
Taught *from* his tender years the taste of blood.

Dryden.

—Were there, *from* all eternity, no memorable
actions done 'till about that time? *Tillotson.* 19.

Contrary to. Not in use.—Any thing so overdone
is *from* the purpose of playing; whose end, both

at the first and now, was and is to hold, as 'twere,
the mirror up to nature. *Hamlet.*—

Do not believe,
That *from* the sense of all civility,

I thus would play and trifle with your reverence.
Shak.

Did you draw bonds to forfeit? Sign, to break?
Or must we read you quite *from* what we speak,

And find the truth out the wrong way? *Donne.*

20. Noting removal.—
Thrice *from* the ground she leap'd. *Dryd Æt.*

21. *From*

21. *From* is very frequently joined by an ellipsis with adverbs: as, *from above*, *from the parts above*; *from below*, *from the places below*: of which some are here exemplified. 22. *FROM above*.—He, which gave them *from above* such power, for miraculous confirmation of that which they taught, endued them also with wisdom *from above*, to teach that which they so did confirm. *Hooker*.—

No sooner were his eyes in slumber bound,
Than, *from above*, a more than mortal sound
Invades his ears. *Dryden's Æn.*

23. *FROM afar*.—

Light demilances *from afar* they throw. *Æn.*

24. *FROM beneath*.—

With whirlwinds *from beneath* she tols'd the
ship,
And bare expos'd the bottom of the deep.

Dryden's Virgil.

An arm arises out of Stygian flood,
Which, breaking *from beneath* with bellowing
sound,
Whirls the black waves and rattling stones a-
round. *Dryden.*

25. *FROM behind*.—

See, to their base restor'd, earth, seas, and
air,
And joyful ages *from behind*, in crowding ranks
appear. *Dryden.*

26. *FROM far*.—

Their train, proceeding on their way,
From far the town and lofty tow'rs survey. *Æn.*

27. *FROM high*.—

Then heav'n's imperious queen shot down
from high. *Dryden.*

28. *FROM thence*. Here *from* is superfluous.—In the necessary differences which arise *from thence*, they rather break into several divisions than join in any one publick interest; and *from thence* have always risen the most dangerous factions, which have ruined the peace of nations. *Clarendon.* 29.

FROM whence. *From* is here superfluous.—

While future realms his wand'ring thoughts
delight,
His daily vision, and his dream by night,
Forbidden Thebes appears before his eye,
From whence he sees his absent brother fly.

Pope's Statius.

30. *FROM where*.—

From where high Ithaca o'erlooks the floods,
Brown with o'er-arching shades and pendent
woods,

Us to these shores our filial duty draws. *Pope.*

31. *FROM without*.—When the plantation grows to strength, then it is time to plant it with women as well as with men, that it may spread into generations, and not be pieced *from without*. *Bacon.*

If native power prevail not, shall I doubt

To seek for needful succour *from without*. *Æn.*

32. *From* is sometimes followed by another preposition, with its proper case. 33. *FROM amidst*.

Thou too shalt fall by time or barb'rous foes,
Whose circling walls the sev'n fam'd hills enclose;
And thou, whose rival tow'rs invade the skies,
And, *from amidst* the waves, with equal glory
rise. *Addison.*

34. *FROM among*.—

Here had new begun
My wand'ring, had not he, who was my guide

Up hither, *from among* the trees app
Presence divine! *Milton's Par*

35. *FROM beneath*.—

My worthy wife our arms missai
And *from beneath* my head my sword
Dryden

36. *FROM beyond*.—There followed him
titudes of people from Galilee, and fr
Jordan. *Matt. iv. 25.* 37. *FROM forth*.

Young Aretus, *from forth* his bride
Brought the full laver o'er his hands
And canisters of consecrated flour.

38. *FROM off*.—The sea being constrain'd
draw *from off* certain tracts of lands, wh
then at the bottom of it. *Woodward*.—

Knights, unhors'd, may rise *from off*
And fight on foot, their honour to reg

39. *FROM out*.—The king with angry th
from out a window, where he was not
the world should behold him a behol
manded his guard and the rest of his
hasten their death. *Sidney*.—

And join thy voice unto the angel
From out his secret altar touch'd with
fire.

Now shake, *from out* thy fruitful
seeds

Of envy, discord, and of cruel deeds.

Strong god of iron, whose iron see
The freezing North and hyperborean
Terror is thine; and wild amazement
From out thy chariot, withers ev'n t

40. *FROM out of*.—Whatsoever such
there is, it was at the first found out by
and *from out of* the very bowels of h
earth. *Hooker.* 41. *FROM under*.—

He, though blind of sight,
Despis'd and thought extinguish'd q
With inward eyes illuminated,
His fiery virtue rous'd

From under ashes into sudden flame. *J*

42. *FROM within*.—

From within

The broken bowels, and the bloated
A buzzing noise of bees his ears alarm

(1.) *FROME*, a river of England,
from several springs in the SW. of I

DESCENTIAE TEMPUS, in botany, the of the year and month, in which each ants unfolds its first leaves. All plants v leaves every year ; but all do not at the same time. Among woody alder, and most of the honeysuckles ; nial herbs, the crocus and tulips, are push or expand their leaves. The ng the seeds decides with respect to he oak and ash are constantly the la- ng their leaves ; the greatest number in spring ; the mosses and firs in win- riking differences with respect to so ca- stance in plants as that of unfolding seem to indicate that each species of emperature proper or peculiar to itself, a certain degree of heat to extricate the their buds. This temperature, how- so fixed or constant as it may at first . Among plants of the same species, me more early than others ; whether stance depends, as it most commonly e nature of the plants, or is owing to a heat, exposure, and soil. In gene- e affirmed, that small and young trees earlier than larger or old ones. The he leaves is likewise accelerated or re- ording to the temperature of the sea-

lon ; that is, according as the sun is sooner or la- ter in dispensing the degree of heat suitable to each species.

* FRONDIFEROUS. *adj.* [*frondifer*, Latin.] Bearing leaves. *DiC*.

FRONDOSUS CORDEX. See BOTANY, *Gloss*.

FRONSAC, a town of France, in the depart- ment of the Gironde, and ci-devant province of Guienne, on the Ille ; 2 miles NW. of Libourne, and 23 NE. of Bourdeaux. Lou. o. 16. W. Lat. 45. 5. N.

(1.) * FRONT. *n. f.* [*frons*, Latin ; *front*, French.] 1. The face.—

His *front* yet threatens, and his frowns com- mand. *Prior*.

They stand not *front* to *front*, but each doth view

The other's tail, pursu'd as they pursue.

Creech's Manilius.

The patriot virtues that distend thy thought, Spread on thy *front*, and in thy bosom glow.

Thomson.

2. The face, in a sense of censure or dislike : as, a hardened *front* ; a fierce *front*. This is the usual sense. 3. The face as opposed to an enemy.—

His forward hand, inur'd to wounds, makes way

Upon the sharpest *fronts* of the most fierce.

Daniel.

4. The part or place opposed to the face.—The access of the town was only by a neck of land ; our men had shot that thundered upon them from the rampier in *front*, and from the galleys that lay at sea in flank. *Bacon*. 5. The van of an army.—

'Twixt host and host but narrow space was left,

A dreadful interval ! and *front* to *front*

Presented stood in terrible array. *Milt*.

6. The forepart of any thing, as of a building.—Both these sides are not only returns, but parts of the *front* ; and uniform without, though severally partitioned within, and are on both sides of a great and stately tower, in the midst of the *front*. *Bacon's Essays*.—Palladius adviseth the *front* of his edifice should so respect the South, that in its first angle it receive the rising rays of the Winter sun, and decline a little from the Winter setting thereof. *Brown's Vulg. Err*.—

The prince approach'd the door,

Possess'd the porch, and on the *front* above

He fix'd the fatal bough. *Dryden's Æn*.

—One sees the front of a palace covered with painted pillars of different orders. *Addison on Italy*.

7. The most conspicuous part or particular.

(2.) FRONT, in anatomy, (§ 1. *def.* 1.) the forehead, or that part of the face above the eyebrows. The Latin *frons*, is derived by Martinus from the Greek *φρον*, to think, or perceive ; of *φρον*, the mind or thought.

(3.) FRONT, in architecture, (§ 1. *def.* 6.) denotes the principal face or side of a building, or that presented to their chief aspect or view.

* (1.) To FRONT. *v. a.* [*from* the noun.] 1. To oppose directly, or face to face ; to encounter.—You four shall *front* them in the narrow lane ; we will walk lower : if they scape from your encounter, then they light on us. *Shak. Hen. IV*.—Can you, when you have push'd out of your gates the

very defender of them, think to *front* his revenges with easy groans. *Shak. Coriol.*—Some are either to be won to the state in a fast and true manner, or *fronted* with some other of the same party that may oppose them, and so divide the reputation. *Bacon's Essay.*—

I shall *front* thee, like some staring ghost,

With all my wrongs about me. *Dryd.*

2. To stand opposed or over-against any place or thing.—The square will be one of the most beautiful in Italy when this statue is erected, and a townhouse built at one end, to *front* the church that stands at the other. *Addison on Italy.*

(2.) * *To FRONT. v. n.* To stand foremost.—

I *front* but in that file,

Where others tell steps with me. *Shak. H. VIII.*

(1.) * *FRONTAL. n. f.* [*frontale*, Latin; *frontal*, French.] Any external form of medicine to be applied to the forehead, generally composed amongst the ancients of coolers and hypnoticks. *Quincy.*—We may apply intercipients upon the temples of mastick: *frontales* may also be applied. *Wifeman.*—The torpedo, alive, stupifies at a distance; but after death produceth no such effect; which had they retained, they might have supplied opium; and served as *frontals* in phrenesies. *Brown's Vulg. Err.*

(2.) *FRONTAL*, in architecture, a little fronton, or pediment, sometimes placed over a small door or window.

(3.) *FRONTAL*, *FRONTLET*, or *Brow-band*, in the Jewish ceremonies, consists of 4 several pieces of vellum, on each of which is written some text of scripture. They are all laid on a piece of black calf's leather with thongs to tie it by. The Jews apply the leather with the vellum on their foreheads in the synagogue, and tie it round the head with the thongs.

FRONTANA, a town of Spain, in Catalonia, 25 miles SE. of Urgel.

* *FRONTATED. adj.* [from *frons*, Latin.] In botany, the *frontated* leaf of a flower grows broader and broader, and at last perhaps terminates in a right line: used in opposition to cusped, which is, when the leaves of a flower end in a point. *Quincy.*

* *FRONTBOX. n. f.* [*front* and *box*.] The box in the playhouse from which there is a direct view to the stage.—

How vain are all these glories, all our pains,
Unless good sense preserve what beauty gains!

That men may say, when we the *frontbox* grace,
Behold the first in virtue, as in face. *Pope.*

FRONTE, a town of Piedmont, in the marquisate of Ivrea, on the Marlon, 11 miles N. of Turin.

* *FRONTED. adj.* [from *front*.] Formed with a front.—

Part *fronted* brigades form. *Milton.*

FRONTEIRA, a town of Portugal in Alentejo, near which the Portuguese, under the D. of Schomberg, defeated the Spaniards in 1663. It is 10 miles N. of Estremoz.

FRONTEITTEN, a town of Germany, in the duchy of Stiria, 14 miles NNW. of Graz.

FRONTENAC. See *FRONTINAC.*

FRONTENHAUSEN, a town of Bavaria, 5 miles S. of Dingelsingen, and 14 E. of Landslut.

(1.) * *FRONTIER. adj.* [*frontiere*, French.] Bordering; conterminous.—

A place there lies on Gallia's utmost
Where rising seas insult the *frontier* ground.

(2.) * *FRONTIER. n. f.* The marches; the utmost verge of any territory; the properly that which terminates not at the fronts another country.—Draw all the ends of those borders away, or plant garrisons at those *frontiers* about him. *Spenser on Ireland.*

I upon my *frontiers* here keep rest
That little which is left so to defend.

(3.) *FRONTIERS* are the extremes of a territory or country, which the enemies find in front where they would enter it. They were anciently called *MARCHES*.

FRONTIGNAC, *FRONTIGNAN*, or *FRONTIGNIAC*, a town of France, in the dep. of Hérault, famous for its excellent wine, seated on the lake Maguelone, 12 miles from Montpellier. Lon. 3. 48. E. Lat. 43. 46.

FRONTINAC, PORT, a fortress of France, on the NW. side of Lake Ontario, 3 miles from its mouth, and 300 from Quebec. It was taken from the French, in Aug. 1759, by the British, under Col. Bradstreet; though defended by 100 men and 60 pieces of cannon, besides 1000 stores.

* *FRONTINUS*, Sextus Julius, an ancient Roman author, of consular dignity, who flourished under Vespasian; Titus, Domitian, Nerva, and Trajan. He commanded the Roman armies in Britain, and made city prætor when Vespasian and Titus were consuls; and curator of the aqueducts of Rome, which occasioned his writing *De aqueductibus Urbis Romæ*. He wrote 4 books upon the Roman art of war; a tract *De re agraria*; another *De limitibus*. These have been several times printed; but were all collected into a neat edition at Amsterdam, in 1661, by Robert Keuchen. He died under Trajan.

(1.) * *FRONTISPIECE. n. f.* [*frontispicium*, Latin.] That part of any building, or other object, which directly meets the eye.—

With *frontispiece* of diamond and gold,
Embellish'd, thick with sparkling ornaments,
The portal shone. *Milton's Paradise Lost.*

—Who is it has informed us that a man can inhabit no tenement, unless it has a sort of *frontispiece*? *Locke.*—The *frontispiece* of a townhouse has pillars of a beautiful black marble streaked with white. *Addison on Italy.*

(2.) *FRONTISPIECE OF A BOOK*, a page with an engraved title on the first page, and properly an emblematical engraved device on the title page.

* *FRONTLESS. adj.* [from *front*.] Wanting shame; void of diffidence. Thee, *frontless* man, we follow'd
Thy instruments of death and tools of war.

For vice, though *frontless* and of hard
Is daunted at the sight of awful grace
Strike a blush through *frontless* flattery.

(1.) * *FRONTLET. n. f.* [*fronteau*, French.] A bandage worn

—How now, daughter, what makes that ? You are too much of late i' th' frown.
ear.—They shall be as *frontlets* between
Dent. vi. 8.—To the forehead *frontlets*
 ed, to restrain and intercept the influx.
Surgery.

NTLET. See *FRONTAL*, § 3.

FO, Marcus Cornelius, a Roman Orator, was preceptor to the emperors Marcus and Lucius Verus. The former made him not only eloquence, but the duty of speech, and excellent morals.

FONTON, a town of France in the department of Garonne, 15 miles N. of Toulouse.

FONTON. See *FRONTAL*, § 2.

FRONTIANI, a sect of Roman Orators, derived M. C. FRONTO, as a model of eloquence.

FRONT ROOM. *n. s.* [*front* and *room*.] An apartment in the forepart of the house.—If your parlour is in an eminent street, the *frontrooms* are only more airy than the backrooms; and inconvenient to make the *frontroom* the parlour.

FREZZELLA, one of the 17 almost inaccessible passes through the mountains of VICENZA, in the Austrian Empire, commencing in the valley of the Adige. It is the narrowest of them, and is flanked by perpendicular rocks, 300 feet high, so that the sun can scarcely penetrate into it, and the eye cannot perceive the sky." "The road," says Dr Oppenheim, "is the most passable" of the 17, "except during snow, when it is the most perilous," (*Stat. Acc. of Marit. Aust.* p. 452.)

FRANDE, a town of Norway, in the department of Drontheim, 60 miles SSE. of Drontheim.

FRANKE, or FROME. See *FROME*, N. 1, 3—5.

FRANKE. *adj.* [*bevroren*, Dutch, frozen.] This word is not used since the time of

The parching air
 of fire, and cold performs th' effect of fire.

FRIGID. *adj.* [*bevroren*, Frozen, Dutch.] Congealed with cold. Obsolete.—

My heart-blood is well nigh *frorne* I feel,
 My galley grown fast to my heel. *Spem.*

FRANK, a town of Up. Saxony, in the duchy of Magdeburg, 10 miles S. of Magdeburg.

FRANCO, a town of Piedmont, 13 miles from Turin.

FRANCO, a town of France, in the department of Eure, 4½ miles SE. of Painboeuf.

FROST. *n. s.* [*frost*, Saxon.] 1. The power of cold; the power or act of congelation.

—is the state of man: to-day he puts forth
 his leaves of hopes; to-morrow blossoms;
 and his blushing honours thick upon him;
 the third day comes a *frost*, a killing *frost*,
 when he thinks, good easy man, full surely
 his greatness is a ripening, nips his root,
 and then he falls. *Shak. Hen. VIII.*

—the *frost* seizes upon wine, only the more
 parts are congealed: there is a mighty
 which can retreat into itself, and within its

own compass lie secure from the freezing impression. *South.* 2. The appearance of plants and trees sparkling with congelation of dew.—

Behold the groves that shine with silver *frost*,
 Their beauty wither'd, and their verdure lost.

Pope's Winter.

(2.) FROST, or FREEZING, in physiology, is such a state of the atmosphere, as occasions the congelation or freezing of water and other fluids. See *FREEZING*. Under the articles *COLD*, *CONGELATION*, *EVAPORATION*, *FLUIDITY*, and *FREEZING*, it is shown, that water and other fluids are capable of containing the element of fire or heat in two very different states. In the one, they seem to imbibe fire in such a manner, that it eludes all the methods by which we are accustomed to observe it, either by our sensation of feeling, or the thermometer; in the other, it manifests itself obviously to our senses, either by the touch, the thermometer, or the emission of light. In the first of these states, we call the body *cold*; and are apt to say that this coldness is occasioned by the *absence* of heat. But this mode of expression is not strictly just, for even those fluids which are coldest to the touch contain a vast deal of heat. Thus vapour, which is colder to the touch than the water from which it was raised, contains an immense quantity of fire. The same may be said of common salt, and snow, or ice. If a quantity of each of these substances is separately reduced to 28° or 30° of Fahrenheit's thermometer, upon mixing them together, the heat which could have raised the thermometer to the degree above-mentioned, now enters into the substance of them in such a manner that the mercury falls down to 0.—Here an excessive degree of cold is produced, and yet we are sure that the substances contain the very same quantity of heat that they formerly did: nay, they will even seem exceedingly cold, when they most certainly contain a great deal more heat than they originally did; for they absorb it from all bodies around them; and if a small vessel full of water is put in the middle of such a mixture, it will in a short time be full of ice. It appears, therefore, that our senses, even when assisted by thermometers, can only judge of the state in which the element of fire is with relation to the bodies around us, without regard to the quantity contained in them. Thus, if heat flows from any part of our body into any substance actually in contact with it, the sensation of cold is excited, and we call that substance *cold*; but if it flows from any substance into our body, the sensation of heat is excited, and we call that substance *hot*, without regard to the absolute quantity contained in either case. See *HEAT*.

(3.) FROST, CAUSES OF THE UNCERTAIN DURATION OF. Of all known substances, the atmosphere either absorbs or throws out heat with the most remarkable facility: and in one or other of these states it always is with respect to the surface of the earth, and such bodies as are placed on or near it; for these, properly speaking, have no temperature of their own, but are entirely regulated by that of the atmosphere.—When the air has been for some time absorbing the heat from terrestrial bodies, a frost must be the undoubted consequence, for the same reason that water free-

gas in a vessel put into a freezing mixture ; and were this absorption to continue for a length of time, the whole earth would be converted into a frozen mass. There are, however, certain powers in nature, by which this effect is always prevented ; and the most violent frost we can imagine must always, as it were, defeat its own purposes, and end in a thaw. To understand this subject, we must observe, 1. In that state of the atmosphere which we denominate frost, there is a most intimate union between the air and the water it contains ; and therefore frosty weather, except in very high latitudes, is generally clear. 2. When such an union takes place, either in winter or summer, we observe the atmosphere also inclined to absorb heat, and consequently to grow frosty. Thus in clear settled weather, even in summer, though the day be excessively hot by the continued sunshine, yet the mornings and evenings are remarkably cold, and sometimes even disagreeably so. 3. The air being therefore always ready in the time of frost or in clear weather, to absorb heat from every substance which comes into contact with it, it follows that it must also absorb part of that which belongs to the vapours contained in it. 4. Though vapour is capable of becoming much colder than water without being frozen, yet by a continued absorption it must at last part with its latent heat, i. e. that which essentially constitutes it vapour ; and without which it is no longer vapour, but water or ice. No sooner, therefore, does the frost arrive at a certain pitch, than the vapours, everywhere dispersed through the air, give out their latent heat : the atmosphere then becomes clouded : the frost either goes off, or becomes milder by the great quantity of heat discharged into the air ; and the vapours descend in rain, hail, or snow, according to the particular disposition of the atmosphere at the time. 5. Even in the polar regions, where it may be thought that the frost must increase beyond measure, there are natural means for preventing its running to extremes. The principal cause here is, the mixture of a great quantity of vapours from the temperate regions of the globe with the air in those dreary climates. It is well known, that aqueous vapour always flies from a warm to a colder place. For this reason, the vapours raised by the sun in the more temperate regions of the earth, must continually fly northward and southward in great quantities. Thus they furnish materials for those immense quantities of snow and ice which are to be found in the neighbourhood of the poles, and which we cannot imagine the weak influence of the sun in these parts capable of raising. It is impossible that a quantity of vapour can be mixed with frosty air, without communicating a great deal of heat to it ; and thus there are often thaws of considerable duration even in those climates where, from the little influence of the sun, we should suppose the frost would be perpetual. 6. We may now account with some probability for the uncertain duration of frosts. In Britain they are seldom of a long continuance ; because the vapours raised from the sea with which our island is surrounded, perpetually mix with the air over it, and prevent a long duration of the frost. For the same reason, *frosts are never of such long duration in maritime*

places on the continent as in the inland. There is nothing, however, more uncertain than the motion of the vapours with which the atmosphere is constantly filled ; and therefore it is impossible to prognosticate the duration of a frost with any degree of certainty. In general, we may say, that if a quantity of vapour is accumulated in any place, no intense frost can subsist in that place for any length of time ; and by the same cause the vapours are driven from place to place, the frosts are driven from place to place throughout the whole world. See VAPOUR.

(4.) FROST, DEPTH OF. Frost, being derived from the atmosphere, naturally proceeds from the upper parts of bodies downwards, as to the earth : so, the longer a frost is continued, the thicker the ice becomes upon the ponds, and the deeper into the earth the frost is frozen. In about 16 or 17 days frost, it was found it had penetrated 14 inches into the ground. At Moscow, in a hard season, the frost penetrated 2 feet deep in the ground ; and Captain Ross found it penetrated 10 feet deep in Charlottenburg, and the water in the same island was frozen to a depth of 6 feet. Scheffer assures us, that in Sweden the frost pierces 2 cubits or 3 feet into the earth, and turns what moisture there is into a whitish substance, like ice ; and that the ice is sometimes three ells, or more. The author also mentions sudden cracks in the ice of lakes of Sweden, 9 or 10 feet deep, and leagues long ; the rupture being made with a noise not less loud than if many guns were fired together. By such means, however, the lakes are furnished with air ; so that they are never found dead.

(5.) FROST, EFFECTS OF. The effects of frost in different countries are mentioned in the article FREEZING, § 1, 2, 4, 6. In the northern parts of the world even solid bodies are rendered brittle by frost. Timber is often apparently rendered exceedingly difficult to saw. Chalk, and other less solid terrestrial bodies will be shattered by strong and durable Metals are contracted by frost : thus, an iron bar 12 feet long, upon being exposed to the frosty night, lost two lines of its length. On the contrary, frost swells or dilates water to the tenth of its bulk. Mr Boyle made several experiments with metalline vessels, exceeding strong ; which being filled with water, and stopped, and exposed to the cold, burst by the expansion of the frozen fluid within them, and were often destroyed by frost, as if burst by the most excessive heat ; and in very strong walnut trees, ashes, and even oaks, are split and cleft, so as to be seen through with a terrible noise, like the explosion of arms. (See § 7.) In cold countries, the frost proves fatal to mankind ; producing gangrene and even death itself. Those who die of frost, their hands and feet first seized, till they lose all feeling ; after which the rest of the body is so invaded, that they are taken with convulsions, which if indulged, they awake but die insensibly. But there is another way whereby it proves mortal, viz. by fre-

and viscera, which on dissection are be mortified and black.

OST, HOAR. See HOAR-FROST.

OST, HURTFUL EFFECTS OF, ON VEGE-

The great power of frost on vegetables is well known; but the differences between those of a severe winter, and those which come in the spring mornings, in their effects on plants and trees, were never perfectly explained, till Du Hamel and Buffon, in the Memoires of the Paris Academy. The frosts of severe winters are much more terrible than those of the spring, as they bring on a privation of all the juices of the tenderer parts of the vegetable. Winter frosts are not so frequent, such as opening perhaps but once in an age; but frosts of the spring are in reality greater to us than these, as they are every year.

In regard to trees, the great difference is that the frosts of severe winters affect even the trunks and large branches; those of the spring have only power to kill the buds. The winter frosts happening at a time when most of the trees in our woods and gardens have neither leaves, flowers, nor fruits on them, and have their buds so hard as to be insensible to slight injuries of weather, especially if the preceding summer has not been too wet; and, if there are no unlucky circumstances, most trees bear moderate winters very well, and hard frosts, which happen late in winter, do great injuries even to those trees which are not utterly destroyed. These are, 1. Long frosts blowing the direction of the fibres. 2. Frosts of dead wood inclosed round with wood in a living state. And, 3. That distemper which foresters call the *double blea*, which is a circle of blea, or soft white wood, which, when the tree is afterwards felled, is found covered with a layer of hard and solid wood. The opinions of authors about the exposition of trees to the winds, have been very different, and are all grounded on no rational foundation. Some are of opinion that the effects of frost are most sensibly felt on those trees which are exposed to the N. and others think the S. or the W. is most strongly affected by them. There is no doubt that the N. exposure is subject to the greatest injury.

It does not, however, follow from this, that the greatest injury must be always greatest on the trees exposed to the N. in frosts: on the contrary, there are abundant proofs, that it is on the S. side that trees are generally most injured by frost: and it is from repeated experiments, that there are many accidents, under which a more moderate frost may do more injury to vegetables, than the most severe one which happens to them under the most favourable circumstances. It is plain from the accounts of the injuries trees received by frosts in 1709 that the greatest of all were produced by repeated false thaws, succeeded by renewed frosts. But the frosts of the spring are abundantly more numerous examples of this; and some experiments made by the late M. Buffon, in his own woods, prove indubitably, that it is not the severest cold or most long frost that does the greatest injury to vegetables. This is an observation directly opposite to

the common opinion, yet it is not the less true, nor any way discordant to reason. We find by a number of experiments, that it is humidity that makes frost fatal to vegetables; and therefore every thing that can occasion humidity in them, exposes them to these injuries, and every thing that can prevent or take off an over proportion of humidity in them, every thing that can dry them though with ever so increased a cold, must prevent or preserve them from those injuries. Numerous experiments and observations tend to prove this. It is well known that vegetables always feel the frost very desperately in low places where there are fogs. The plants which stand by a river side are frequently found destroyed by the spring and autumnal frosts, while those of the same species, which stand in a drier place, suffer little or perhaps not at all by them; and the low and wet parts of forests are well known to produce worse wood than the high and drier. The coppice wood in wet and low parts of common woods, though it push out more vigorously at first than that of other places, yet never comes to so good a growth; for the frost of the spring killing these early top shoots, obliges the lower part of the trees to throw out lateral branches: and the same thing happens in a greater or lesser degree to the coppice wood that grows under cover of larger trees in great forests; for here the vapours, not being carried off either by the sun or wind, stagnate and freeze, and in the same manner destroy the young shoots, as the fogs of marshy places. It is a general observation also, that the frost is never hurtful to the late shoots of the vine, or to the flower-buds of trees, except when it follows heavy dews, or a long rainy season, and then it never fails to do great mischief, though it be ever so slight. The frost is always observed to be more mischievous in its consequences on newly cultivated ground than in other places; and this is because the vapours which continually arise from the earth, find an easier passage from those places than from others. Trees also which have been newly cut, suffer more than others by the spring frosts, which is owing to their shooting out more vigorously. Frosts also do more damage on light and sandy grounds, than on the tougher and firmer soils, supposing both equally dry; and this seems partly owing to their being more early in their productions, and partly to their lax texture suffering a greater quantity of vapours to transpire. It has also been frequently observed, that the side-shoots of trees are more subject to perish by the spring frosts than those from the top; and M. Buffon, who examined into this with great accuracy, always found the effects of the spring frosts much greater near the ground than elsewhere. The shoots within a foot of the ground are quickly perished by them; those which stood at two or three feet high, bore them much better; and those at four feet and upwards frequently remained wholly unhurt, while the lower ones were entirely destroyed. A series of observations have proved beyond all doubt, that it is not the hard frosts which so much hurt plants, as those frosts, though less severe, which happen when they are full of moisture; and this clearly explains the account of all the great damage done by the severe

frosts being on the south side of the trees which are affected by them, though that side has been plainly all the while less cold than the north. Great damage is also done to the western sides of trees and plantations, when after a rain with a west wind the wind turns about to the north at sunset, as is frequently the case in spring, or when an east wind blows upon a thick fog before sun-rising.

(8.) FROST, MELIORATION OF AROMATIC SPIRITS BY. Mr Baume observes, that aromatic spirituous waters have less scent when newly distilled, than after they have been kept about six months: and he found that the good effects of age was produced in a short time by means of cold; and that, by plunging quart bottles of the liquor into a mixture of pounded ice and sea salt, the spirit, after having suffered for 6 or 8 hours the cold hence resulting, proves as grateful as that which hath been kept many years. Simple waters also, after having been frozen, prove far more agreeable than they were before. Geoffroy takes notice of this melioration by frost; *Hist. Acad.* 1713.

(9.) FROST, MELIORATION OF LAND BY. See HUSBANDRY.

(10.) FROSTS, REMARKABLE. In the year 220, a frost in Britain lasted 5 months. In 250, The Thames was frozen 9 weeks. 291, Most rivers in Britain frozen 6 weeks. 359, Severe frost in Scotland for 14 weeks. 508, The rivers in Britain frozen for 2 months. 558, The Danube quite frozen over. 695, Thames frozen 6 weeks, and booths built on it. 759, Frost from Oct. 1 till Feb. 26, 760. 827, Frost in England for 9 weeks. 859, Carriages used on the Adriatic. 908, Most rivers in England frozen 2 months. 923, The Thames frozen 13 weeks. 987, Frost lasted 120 days: began Dec. 22. 998, Thames frozen 5 weeks. 1035, Severe frost on June 24: the corn and fruits destroyed. 1063, The Thames frozen 14 weeks. 1076, Frost in England from Nov. till April. 1114, Several wooden bridges carried away by ice. 1205, Frost from Jan. 15 till March 22. 1407, Frost that lasted 15 weeks. 1434, From Nov. 24 till Feb. 10. Thames frozen down to Gravesend. 1631, Frost for 13 weeks. In 1708—9, an extraordinary frost throughout most parts of Europe, though scarcely felt in Scotland, or Ireland. In 1715, Severe frost for many weeks. 1739, One for 2 weeks; began Dec. 24. 1742, Severe frost for many weeks. 1747, Severe frost in Russia. 1754, Severe one in England. 1760, The same in Germany. 1776, The same in England. 1788, The Thames frozen below bridge; and booths erected on it. 1795, The Zuyder Zee frozen over, and the rivers of Holland passed by the French.

* FROSTBITTEN. *adj.* [*frost* and *bitten*.] Nipped or withered by the frost.—The leaves are too much *frostbitten*. *Martiner*.

* FROSTED. *adj.* [from *frost*.] Laid on in inequalities, like those of the hoar frost upon plants.—

The rich brocaded silk unfold,

Where rising flow'rs grow stiff with *frosted* gold.

Gay.

FROSTENBY, a village near Scarborough.

* FROSTILY. *adv.* [from *frosty*.] 1. With

frost; with excessive cold. 2. With of affection.—

Courtling, I rather thou should'
Dispraise my work, than praise it;

* FROSTINESS. *n. s.* [from *frost* and *ness*.] A quality of being frosty or freezing cold.

* FROSTNAIL. *n. s.* [*frost* and *nail*.] A nail with a prominent head driven into shoes, that it may pierce the ice.—T'is strait only to take hold, for better as a horse that is shod with *frostnails*.

* FROSTWORK. *n. s.* [*frost* and *work*.] A substance in which the substance is laid on with like the dew congealed upon shrubs.—

By nature shap'd to various figure
The fruitful rain, and these the ha
The snowy fleece and curious *frost*
Produce the dew, and those the ge

* FROSTY. *adj.* [from *frost*.] 1. Having the power of congelation; excessive cold.

For all my blood in Rome's great
For all the *frosty* nights that I have
Be pitiful to my condemned sons. S
—The air, if very cold, irritateth the
maketh it burn more fiercely; as fire
in *frosty* weather. *Bacon*.—A gnat,
with cold and hunger, went out one
ing to a bee-hive. *L'Estrange*. 2. Cl
tion; without warmth of kindness or

What a *frosty*-spirited rogue is th

vice in a week go to bed without broth.

Tusser.

FROTH. *v. n.* [from the noun.] To foam;
out spume; to generate spume.—

rets within, *froths* treason at his mouth,
urns it through his teeth. *Dryd. Don. Seb.*
muddies the best wit, and only makes it
d *froth* high. *Greav.*

FROTHY. *adv.* [from *frothy*.] 1. With
th spume. 2. In an empty trifling man-

FROTHINESS, *n. f.* The state of being frothy;
want of solidity. *Asb.*

SPIT, or **CUCKOW-SPIT**, a name given
ite froth, or spume, very common in
d the first months of summer, on the
certain plants, particularly on those of
non white field lychnis, or catchfly,
lled by some *spatling poppy*. All writers
bles have taken notice of this froth,
w have understood the cause or origin of
ite. It is formed by a little leaping ani-
d by some the *flea grasshopper*, by ap-
anus close to the leaf, and discharging
a small drop of a white viscous fluid,
etaining some air in it, is soon elevated
in bubble: before this is well formed, it
such another drop; and so on, till it is
overwhelmed with a quantity of these
which form the white froth which we
lin this spume it is seen to acquire 4
on its back, wherein the wings are in-
sele bursting, from a reptile it becomes
animal: and thus, rendered perfect, it
cet its mate, and propagate its kind.
oblong, obtuse body; a large head with
; 4 external wings, of a dusky brown
arked with two white spots: the head
It is a species of **CICADA**.

FROTHY. *adj.* [from *frothy*.] 1. Full of
th, or spume.—The sap of trees is of
atures; some watery and clear, as vines,
ears; some thick, as apples; some gum-
mies; and some *frothy*, as elms. *Bacon*.
ld a *frothy* substance rise;
ious, or your bottle flies. *Swift*.
ot solid; wasting.—Their bodies are so
ard as you need not fear that bathing
ke them *frothy*. *Bacon's Natural Hist.*
mpy; trifling.—What's a voluptuous
nd the *frothy* vanity of discourse that
attends these pompous entertainments?
but a mortification to a man of sense
? *L'Estrange*.—Though the principles
were never so clear and evident, yet
be made ridiculous by vain and *frothy*
the gravest and wisest person in the

PART I.

world may be abused by being put in a fool's
coat. *Tillotson*.

FROUARD, a town of France, in the dep. of
Meurthe, on the Moselle, 5 m. NNW. of Nancy.

FROULAY-TESSÉ, a town of France, in the
dep. of Orne, 7 miles SE. of Domfront.

* **FROUNCE**. *n. f.* A word used by falconers
for a distemper, in which white spittle gathers a-
bout the hawk's bill. *Skinner*.

* *To FROUNCE*. *v. n.* [from the noun.] To
frizzle or curl the hair about the face. This word
was at first probably used in contempt.—

Some *frounce* their curled hair in courtly guise,
Some prank their ruffs, and others timely dight
Their gay attire. *Spenser's Fairy Queen*.

—Some warlike sign must be used; either a slovenly
buskin, or an overstaring *frounced* head. *Ascham*.—

Thus, night oft see me in thy pale career,
'Till civil suited morn appear;
Not trick'd and *frounc'd* as she was wont,
With the attick boy to hunt. *Milton*.

FROUQUÉ, an islet 1 mile W. of Jersey.

* **FROUZY**. *adj.* [A cant word.] 1. Fœtid;
musty.—

Petticoats in *frouzy* heaps. *Swift*.

2. Dim; cloudy.—

When first Diana leaves her bed,
Vapours and steams her looks disgrace;
A *frouzy* dirty-coloured red

Sits on her cloudy wrinkled face. *Swift*.

* **FRWARD**. *adj.* [*frameword*, Saxon.] Pee-
vish; ungovernable; angry; perverse; the con-
trary to *toward*.—The *froward* pain of mine own
heart made me delight to punish him, whom I
esteemed the chiefest let in the way. *Sidney*.—

She's not *froward*, but modest as the dove;

She is not hot, but temperate as the moon. *Shak.*
—Whole ways are crooked, and they *froward*,
in their paths. *Prov. ii. 15*.—Time moves a
round, that a *froward* retention of custom is as
turbulent a thing as innovation. *Bacon*.—'Tis
with *froward* men, and *froward* factions too, as
'tis with *froward* children; they'll be sooner qui-
eted by fear than by any gentle or civil. *L'Estrange*.
—Motions occasion sleep, as we find by the com-
mon use and experience of rocking *froward* chil-
dren in cradles. *Temple*.

* **FRWARDLY**. *adv.* [from *froward*.] Pee-
vishly; perversely.—I hid me and was wroth, and
he went *frowardly* in the way of his heart. *Isaiah*,
lvii. 17.

* **FRWARDNESS**. *n. f.* [from *froward*.]
Peevishness; perverseness.—How many *froward-
nesses* of ours does he smother? how many indi-
gnities does he pass by? how many affronts does
he put up with at our hands? *South*.—

We'll mutually forget

The warmth of youth, and *frowardness* of age.
Addison's Cato.

FROWDE, Philip, an English poet, the son
of a gentleman who had been post-master in the
reign of Queen Anne. He was sent to the uni-
versity of Oxford, where he contracted an inti-
macy with Mr Addison. He wrote several ele-
gant Latin poems, inserted in the *Musæ Anglica-
næ*; and 2 tragedies: *The Fall of Saguntum*, de-
dicated to Sir Robert Walpole; and *Philotas*,

R

addressed

addressed to the earl of Chesterfield. He died at London, in 1738, with a very amiable character.

* FLOWER. *n. s.* [I know not the etymology.] A cleaving tool.—

A *frower* of iron for cleaving of lath,
With roll for a sawpit, good husbandry hath.
Tusser.

* FROWN. *n. s.* [from the verb.] A wrinkled look; a look of displeasure.—Patiently endure that *frown* of fortune, and by some notable exploit win again her favour. *Knolles's Hist. of the Turks.*—

In his half-clos'd eyes
Stern vengeance yet and hostile terror stand;
His front yet threatens, and his *frowns* command.
Prior.

* To FROWN. *v. a.* [*frogner*, old French, to wrinkle, *Skinner.*] To express displeasure by contracting the face to wrinkles; to look stern.—

Say, that she *frowns*; I'll say she looks as clear
As morning roses newly wash'd with dew. *Shak.*

They chuse their magistrate;
And such a one as he, who puts his shall,
His popular shall, against a graver bench
Than ever *frown'd*. *Shak. Coriolanus.*

—How now, daughter, what makes that frontlet
on? You are too much of late i'th' frown.—

Thou wast a pretty fellow, when thou hadst no
need to care for her *frowning*. *Shak. King Lear.*
Heroes in animated marble *frown*. *Pope.*

The wood,
Whose shady horrors on a rising brow
Wav'd high, and *frown'd* upon the stream below.
Pope.

* FROWNINGLY. *adv.* [from *frown*.] Sternly; with a look of displeasure.—

What, look'd he *frowningly*?
A countenance more in sorrow than in anger.
Shakespeare's Hamlet.

* FROWY. *adj.* Musty; mossy. This word is now not used; but instead of it *frouzy*—

But if they with thy gores should yede,
They soon might be corrupted;
Or like not of the *frowy* fede,
Or with the weeds be glutted. *Spenser's Past.*

FROXFIELD, 2 villages: 1. in Hamph. N. of Peterfield: 2. in Wilts, 2 miles from Hungerford.

FROYEN, an island near the coast of Norway 35 m. in circuit. Lon. 9. 0. E. Lat. 63. 45. N.

FROYLE, a village in Hampshire.

* FROZEN. *part. pass.* of freeze. 1. Congealed with cold.—

What was the waste of war, what fierce alarms
Shook Asia's crown with European arms?

Ev'n such have heard, if any such there be,
Whose earth is bounded by the frozen sea. *Æn.*

Fierce Boreas, with his offspring, issues forth
To invade the frozen waggon of the North. *Ovid.*

A cheerful blaze arose, and by the fire
They warm'd their frozen feet, and dry'd their
wet attire. *Dryden's Flower and Leaf.*

2. Chill in affection.—Against whom was the fine
frozen knight, frozen in despair; but his armour
naturally representing ice, and all his furniture
lively answering thereto. *Sidney.*—

Be not ever frozen, coy;
One beam of love will soon destroy
And melt that ice to floods of joy. *Carew.*

3. Void of heat or appetite.—

Even here, where frozen chastity
Love finds an altar for forbidden fire
FROZES, a town of France, in the
of Vienne, 5 miles W. of Poitiers.

 3 miles W. of Mafu Point.

FRUIT. *n. f.* [*fructus*, Lat. *frwyth*, Welsh;
] 1. The product of a tree or plant in
 which seeds are contained.—

strawberry grows underneath the nettle,
 wholesome berries thrive and ripen best,
 sour'd by fruit of baser quality. *Shak.*
 part of a plant which is taken for food.—

By tasting of that fruit forbid,
 they sought knowledge, they did error
 find. *Davies.*

how the rising fruits the gardens crown,
 the sun, and make his light their own.

Blackmore.

tion.—The fruit of the spirit is in all
 and righteousness, and truth. *Ephes. v. 9.*
 spring of the womb; the young of any

if thou their reck'nings keep? the time
 compute,

their swol'n bellies shall enlarge the fruit.

Sandys.

5. Advantage gained by any enterprise or conduct.

—What is become of all the king of Sweden's
 victories? Where are the *fruits* of them at this
 day? Or of what benefit will they be to posterity?
Swift.—Another *fruit*, from considering things in
 themselves, will be, that each man will pursue his
 thoughts in that method which will be most agree-
 able to the nature of the thing, and to his appre-
 hension of what it suggests to him. *Locke.* 6. The
 effect or consequence of any action.—She blushed
 when she considered the effect of granting; she
 was pale when she remembered the *fruits* of de-
 denying. *Sidney*—They shall eat of the *fruit* of their
 own way. *Prov.*

(II.) FRUIT, in its general sense, includes what-
 ever the earth produces for the nourishment of a-
 nimals, expressed by the Latins under the name
 FRUGES.

(III.) FRUIT, in botany, (§ I. *def. 1.*) called by
 the Greeks *καρπός*, in the Linnæan system, is one
 of the parts of fructification, and is distinguished
 into three parts, viz. the pericarpium, seed, and
 receptacle, or *receptaculum seminum*. See BOTANY.

(IV.) FRUITS, COLOURS EXTRACTED FROM.
 See COLOUR-MAKING, *Index*.

(V.) FRUITS, in commerce, (§ I. *def. 2.*) are dis-
 tinguished into *recent* or *fresh*, and *dry*.

1. FRUITS, DRY, are those dried in the sun, or
 by the fire, with other ingredients sometimes ad-
 ded to them to make them keep; imported chief-
 ly from beyond sea, and sold by the grocers. Such
 are raisins, currants, figs, capers, olives, cloves,
 nutmegs, pepper, and other spices; which see in
 their order. Under the denomination of *dry fruits*
 are also frequently included apples, pears, al-
 monds, filberds, &c.

2. FRUITS, FRESH, OR RECENT, are those sold
 just as they are gathered from the tree, without
 any farther preparation; as are most of the pro-
 ductions of our gardens and orchards, sold by the
 fruiterers.

(VI.) FRUITS, MISCHIEFS ARISING FROM
 SWALLOWING THE STONES OF. The dangers
 arising from swallowing the stones of plums and
 other fruits are very great. The *Philos. Transf.*
 give an account of a woman who suffered violent
 pains in her bowels for 30 years, returning once
 in a month or less. At length, a strong purge be-
 ing given her, the occasion of all these complaints
 was driven down from the bowels to the anus;
 where it gave a sensation of distension and stop-
 page, producing a continual desire of going to
 stool, but without voiding any thing. By proper
 assistance, there was taken out with a forceps a
 ball of an oval figure, of about 10 drachms in
 weight, and measuring 5 inches in circumference.
 This had caused all the violent fits of pain which
 she had suffered for so many years; and, after
 voiding it, she became perfectly well. The ball
 extracted looked like a stone, and felt very hard,
 but swam in water. On cutting it through with
 a knife, there was found in the centre, a plum
 stone, round which several coats of this hard and
 tough matter had gathered. Another instance is
 given in the same papers of a man, who, dying of
 an incurable colic which had tormented him many
 years, and baffled the effects of medicines, was
 opened after death; and in his bowels was found

a ball similar to that above-mentioned; but somewhat larger, being 6 inches in circumference, and weighing an ounce and a half. In the centre of this, as of the other, there was found the stone of a common plum, and the coats were of the same nature with those of the former. These and similar instances mentioned in the same work, sufficiently show the folly of that common opinion that the stones of fruits are *wholesome*. Even cherry stones, swallowed in great quantities, have occasioned death.

* **FRUITAGE**. *n. s.* [*fruitage*, Fr.] Fruit collectively; various fruits.—

In heav'n the trees
Of life ambrosial *fruitage* bear, and vines
Yield nectar. *Milton's Par. Lost.*

Greedy they pluck'd
The *fruitage*, fair to fight, like that which grew
Near that bituminous lake where Sodom flam'd.
Milton.

—What is more ordinary with them than the taking in flowers and *fruitage* for the garnishing of their work? *More.*

* **FRUITBEARER**. *n. s.* [*fruit and bearer*.] That which produces fruit.—Trees, especially *fruitbearers*, are often infected with the measles, *Mort. H.*

* **FRUITBEARING**. *adj.* [*fruit and bear*.] Having the quality of producing fruit.—By this way graft trees of different kinds one on another, as *fruitbearing* trees on those that bear not. *Martin.*

* **FRUITERER**. *n. s.* [*fruitier*, Fr.] One who trades in fruit.—I did fight with one Sampson Stockfish, a *fruiterer*, behind Gray's inn. *Shak.*

Walnuts the *fruit'er's* hand in Autumn stain;
Blue plums and juicy pears augment his gain.
Gay.

(1.) * **FRUITERY**. *n. s.* [*fruiterie*, Fr.] 1. Fruit collectively taken.—

Oft, notwithstanding all thy care
To help thy plants, on the small *fruitery*
Exempt from ills, an oriental blast
Disastrous flies. *Philips.*

2. A fruit-loft; a repository for fruit.

(2.) A **FRUITERY**, (§ 1. *def* 2.) should be inaccessible to moisture; and should be as much as possible so, even to frost.

FRUIT-FLIES, a name given by gardeners and others to a sort of small black flies, found in vast numbers among fruit-trees, in the spring season, and supposed to do great injury to them. Mr Leeuwenhoek preserved some of these flies for his microscopical observations. He found that they did not live longer than a day or two, but that the females during this time laid a great number of longish eggs. The gardeners who suppose that these flies wound the leaves of the trees, are mistaken: it is true that they feed on their juices; but they have no instruments wherewith they can extract these for themselves: they feed on such as are naturally extravasated; and when there is not a sufficient quantity of these for their purpose, they haunt the places to which the pucerons resort, and feed on the juices which these little creatures extravasate, by means of the holes they bore in the leaves with their trunks.

* **FRUITFUL**. *adj.* [*fruit and full*.] 1. Fertile; abundantly productive; liberal of vegetable product.—If she continued child, he could do more

sustain his life, than the earth remain *fruitful* in the sun's continual absence. *Sidney.*—

The Earth,

Though in comparison of Heav'n, so
Nor glist'ring, may of solid good con-
More plenty, than the sun that barren
Whose virtue on itself works no effect
But in the *fruitful* earth.

2. Actually bearing fruit.—

Adonis' gardens,

That one day bloom'd, and *fruitful*
next.

3. Prolifick; childbearing; not barren.
Hear, Nature, hear; dear goddess,
ther!

Suspend thy purpose, if thou did'st in
To make this creature *fruitful*:

Into her womb convey sterility. *Shak.*
Male he created thee, but thy conf-
Female for race; then bless'd mankind.

Be *fruitful*, multiply, and fill the Earth
Subdue it, and throughout dominion have

—I have copied Nature, making the you-
rous and the damsels *fruitful*. *Gay.* 4. P
abounding in any thing.—

While you, my lord, the rural shade
And from Britannia's public posts reti-
Me into foreign realms my fate conve-
Thro' nations *fruitful* of immortal lay

* **FRUITFULLY**. *adv.* [from *fruitful*.]
such a manner as to be prolifick.—

How sacred seeds of sea, and air, a
And purer fire through universal night
And empty space did *fruitfully* unite.

2. Plenteously; abundantly.—You have
opportunities to cut him off: if your will
time and place will be *fruitfully* offered.

* **FRUITFULNESS**. *n. s.* [from *fruitful*.]
Fertility; fecundity: plentiful production
ther can we ascribe the same *fruitfulness*,
part of the earth, nor the same virtue to
thereon growing, that they had before
Raleigh's Hist. 2. The quality of being
or bearing many children.—

The goddess, present at the match
So bless'd the bed, such *fruitfulness* did
That ere ten moons had sharpen'd eit
To crown their bliss, a lovely boy was

Dryden.

3. Exuberant abundance.—The remedy
fulness is easy, but no labour will help
trary: I will like and praise some things in
writer, which yet, if he continues in,
but justly have him for. *Ben Jonson's Di-*

* **FRUITGROVES**. *n. s.* [*fruit and*
Shades, or close plantations of fruit trees

The faithful slave,

Whom to my nuptial train Icarus gave
To tend the *fruitgroves*. *Pope*

* **FRUITION**. *n. s.* [*fruor*, Lat.] En-
possession; pleasure given by possession.
Man doth not seem to rest satisfied with
fruition of that wherewith his life is pass-
with performance of such actions as adv-
most deservedly in estimation. *Hooker.*—

I'm driv'n, by breath of her reno-
Either to seek shipwreck, or to arrive
Where I may have *fruition* of her love.

riches and renown to men imparts,
 they wish; and yet their narrow hearts
 so great a fluency receive,
 in *fruition* to a stranger leave. *Sandys.*
 once, like beauty, without art or dress,
 and unadorn'd, could find success;
 in *fruition*, novelty destroy'd,
 must find new charms to be enjoy'd.

Granv.

on generally disables a man from pursuing
 in which the guilt of men consists: if
 ion be on his body, his appetites are
 , and capacity of *fruition* destroyed.

Termians.

FIVE. *adj.* [from the noun.] Enjoying;
 ; having the power of enjoyment. A
 legitimate.—To whet our longings for
 experimental knowledge, it is reserved
 the prerogatives of being in heaven, to
 happy we shall be, when there. *Boyle.*

ITLESS. *adj.* [from *fruit*.] 1. Barren of
 bearing fruit.—The Spaniards of Mexi-
 the first forty years, could not make our
 wheat bear seed; but it grew up as high
 es, and was *fruitless*. *Raleigh's History.*
 productive of no advantage; idle; un-

let me not, quoth he, return again
 to the world, whose joys so *fruitless* are;
 let me here for ay in peace remain,
 rightway on that last long voyage fare.

Spenser's Fairy Queen.

ent! we might have spar'd our coming
 ther;

to me, tho' fruit be here t'excels. *Milt.*
 ber is for entirely waving all searches in-
 ity, in relation to this controversy, as
 her needles or *fruitless*. *Waterland.* 3.
 o off-spring.—

on my head they plac'd a *fruitless* crown,
 at a barren sceptre in my gripe;

of mine succeeding. *Shakesp. Macbeth.*

ITLESSLY. *adv.* [from *fruitless*.] Vain-
 unprofitably.—After this fruit curiosity
 enquireth, and confidence blindly deter-

Brown's Vulgar Errors.—

ing they talk'd, and *fruitlessly* divin'd
 friend the priestess by those words de-
 n'd. *Dryden.*

IT-TIME. *n. f.* [from *fruit* and *time*.] The
 the time for gathering fruit.

UIT-TREE. *n. f.* [from *fruit* and *tree*.] A
 at kind whose principal value arises from
 produced by it.—

, by yonder blessed moon I vow,
 ips with silver all these *fruit-tree* tops.

Shakespeare.

possessed houses full of all goods, wells
 vineyards and oliveyards, and *fruit-trees*
 ince. *Neb. ix. 25.*—

with a border of rich *fruit-trees* crown'd,
 loaded branches hide the lofty mound.

Waller.

UIT-TREES, GENERAL OBSERVATIONS
 he cutting or pruning them when young,
 in bearing, though it contributes to the
 and flavour of the fruit, as well as to the

beauty of the tree. 2. Kernel fruit-trees come
 later to bear than stone fruit-trees: the time re-
 quired by the first, before they come to any fit
 age for bearing, being on an average 5 years; but
 when they do begin, they bear in greater plenty
 than stone fruit. 3. Stone fruit, figs, and grapes,
 commonly bear considerably in 3 or 4 years, and
 bear full crops the 5th and 6th years; and hold it
 for many years, if well ordered. 4. Fruit-trees
 in the same neighbourhood will ripen a fortnight
 sooner in some grounds than in others of a diffe-
 rent temperature. 5. In the same country, hot
 or cold summers set considerably forwards, or put
 backwards, the same fruit. 6. The fruit on wall
 trees generally ripen before those on standards,
 and those on standards before those on dwarfs.
 9. The fruit of all wall trees planted in the S. and
 E. quarters, commonly ripen about the same time,
 only those in the S. rather earlier than those in the
 E.; those in the W. are later by 8 or 10 days;
 and those in the N. by 15 or 20.

PRESERVING, &c. OF. See **GRAFTING, ORCH-**
ARD. PLANTING, TREE, &c.

(IV.) **FRUIT-TREES, Mr FORSYTH'S MANAGE-**
MENT OF. The following particulars relating to
 Mr William Forsyth of Kensington's management
 of fruit trees, communicated to the E. of Buchan
 by Dr James Anderson of Mounzie, Nov. 19, 1797,
 have been very obligingly transmitted to us by his
 Lordship.—“This subject falls to be considered
 under two points of view: I. That of recovering
 decayed trees, and eradicating the diseases to which
 fruit-trees are subjected: II. Pruning, so as to in-
 sure a constant succession of fruit-bearing buds.
 On each of these heads I shall offer such observa-
 tions as I have been able to pick up.”

I. **FRUIT-TREES, Mr FORSYTH'S METHOD OF**
CURING, WHEN DECAYED, OR INJURED.—“I. The
 recovering of decayed trees, is an operation pure-
 ly chirurgical, for it is in all respects analogous to
 what takes place in animal bodies, with this sin-
 gular difference in respect to vegetables, that life
 can be seemingly renovated, and the vigour of
 youth restored, after the vital powers are nearly
 annihilated, in consequence of the gradual decays,
 which were the natural effects of extreme senility.
 I mentioned to your lordship, if you recollect, at
 Dryburgh Abbey, a cherry tree which will afford
 a full illustration of what I here say. This cherry
 tree had been brought from abroad by an English
 admiral, with 3 more of the same sort, about the
 beginning of this century, and had been planted
 at Kensington, in the king's garden. The other 3
 were sent to different places. These 3 trees have
 been totally dead for many years, and that at Ken-
 sington was so much decayed, that it had not been
 known to carry any fruit within the memory of
 man, and it was so far reduced about 4 years ago,
 that it made no shoots at all, though it still conti-
 nued to send forth a few leaves. The king chanced
 to take notice of this decayed stump, and observed
 to Forsyth, that he supposed this tree was past his
 power to recover. Forsyth thought so himself,
 but merely to try what could be done, he exami-
 ned the tree with great care. He found that it
 was entirely dead in every part, unless upon one
 side,

side, where a strip of bark, not much above one inch in breadth, was still alive, and on cutting off the top of the tree, within about one foot of the root, he found the wood was totally dead, unless a small slip immediately under the living bark, a section of which you may conceive, from the annexed sketch; (see *Plate CLVIII, fig. 4.*) the whole part at A being all that was alive. His method is to pare off all the dead bark, near the place where it is alive, and to proceed onward till he comes to the *quick*. He cuts into the edges of this all round, till he feels he is every where at the *quick*; then scooping away the dead wood, leaving only a little at the back of the *quick* wood for the present to protect it, as in the section, represented on *Plate CLVIII, fig. 5.* He then covers the fresh cut edges of the bark, and the sound part of the wood that is left, with his composition. (See § 3.) The consequence of these operations are, that from the top of the bark, and the sound part of the wood, shoots of considerable vigour sprung out, which vigour was augmented by rubbing off all the buds that appeared, except 2 or 3. The edges of the bark all round begin to swell in the spring and to roll round, in the manner represented in *fig. 6.* Next year more of the dead wood next the edges is cut away, cutting into the *quick* at those places, and cutting off the inner edge of the new roll of bark next to the wood, and then covering the wound with the salve. Next year the roll at each side increases, as represented, *fig. 7.* And so on from year to year, till the decayed wood being scooped out to give room, till in a few years it assumes the form of *fig. 8.* And by continuing the same process the open is entirely closed, and the whole stem left as sound wood as any tree whatsoever. While this process is going on in the body of the tree, the branches advance with increasing vigour, and cover the top of the wound, while new roots spring out in the same manner from below; so that the tree becomes renewed in all its parts, and is for every purpose as vigorous as a young tree, and for the yielding of fruit much more beneficial, as he finds in general that an old decaying tree (not so far gone however as that just described, but past bearing good fruit) will produce commonly as much fruit in the 3d year after being cut over, as could be obtained from a young planted tree of the same kind in the 30th year from the time of planting. The cherry tree above described is now in full bearing, and produced last season some thousands of cherries of the finest sort. —Diseases affecting fruit trees are eradicated on the very same principle explained above. Cherries, plums, apricots, peaches, and other stone fruits, if they receive ever so slight a bruise upon the bark, become immediately covered with gum; and wherever that gum appears, it acts as a canker which kills the bark and the wood under it; and this spreads wider and wider, till in a short time the whole is destroyed. In order to guard against this, he watches his trees with care, and wherever he perceives the appearance of gum, at whatever season of the year it be, he takes his knife, cuts off the gum, and all the infected bark and wood under it, till he be at the *quick* every where, and immediately covers it with his salve. It heals over immediately, and in a very short time it is per-

fectly sound and beautiful. But when a tree, that has been long mis-managed, has its bark gangrened in many places in that case he scrapes off the whole bark entirely, leaving the inner bark it is sound, but in all the places where it is decayed, the whole of that decayed part and wood, is scooped entirely out, leaving nothing but the *quick*; and when this is thus gone over, it is entirely covered with the salve in every part. After this the wounded places soon skin over, and in two, the salve being gradually thrown off, the whole becomes covered with a new bark, and shining like the most healthy tree. This operation is peculiarly useful for old apple trees, whose bark has become covered with canker, and is besides rigid and unhealthy. It is to be headed down, if old and broken, and this process ought never to be omitted.

2. FRUIT-TREES. Mr FORSYTH'S PRUNING. II. "With regard to pruning trees, if standards, Mr Forsyth never shoots. He encourages a good number to push out round the stem, and leaves them at that state. In his garden, where cattle are kept, he heads them down very low, and keeps them rather as bushes than trees; seldom allowing them to grow so high as to be beyond his reach in gathering the fruit. And as he always shoots young, he can easily bend them in any way. From the tendency that young trees have to shoot out from old wood, which produce fruit, he seldom fails to have a crop year after it has been headed down. He shows me one pear tree, that had been headed down the 1st year, he gathered 2,500 pears the 3d year after it was cut; there were 3 young trees just beside it, about the same age, in high health and vigour, from which he did not gather more than 600. The difference between the fertility of these young trees and the real young ones is indeed astonishing. On this account he buys old trees and shoots them, in preference to young ones, and supplies those persons with young trees who wish to change for the old ones, which they would otherwise throw out of their gardens. As trees thus trained are in general very full of fruit, he takes care to cut out some of the strongest when they get too large, and lets the others spring up in their place, thus keeping them constantly in the wild state of a kind of bush rather than trees, which to my taste is the appearance of art about them, but generally irregular, is very beautiful, the fruit being intermixed with the branches every where. I scarcely add, that, wherever amputation is made, the wounds are immediately covered with salve. In stone fruit particularly, this must not be omitted or even delayed. In regard to this mode of pruning differs in some respects according to the diversity of the kind of fruit to be managed; for he finds, that to obtain a crop over the whole tree, a difference of treatment is required on every individual kind of fruit, as nectarine, peach, &c. but into the

I consider as of very great importance, I pretend to enter, because I do not know myself. All I can do is to develope what I take to be the general basis of his practice. He shortens a shoot during summer, unless the upright stem, which he sometimes cuts twice or even thrice in a season, if it grows to make it push out shoots for filling up part of the tree, which would be in some cases left bare without this precaution. All the shoots he lays in at full length, till September, when he shortens every shoot he means to take advantage of within about 6 inches of the stem from the top of the springs. In this state he leaves it till the next spring when he goes over the whole as convenient; and at that time he cuts it off close to the stem, so as to leave only one or at most two at the root of it, close at the stem of the tree. From these eyes, thus left, there generally push out only a couple of leaves next spring, which the year thereafter become fruitful and that with great certainty. After this the wood has ripened its fruit, he shortens that in winter, leaving only one eye or two at the top. These eyes also push out only leaves the next spring, which the year thereafter become fruitful; and so on he keeps the whole tree continually covered with fruit buds of this season, preparatory buds which are to come in their next season. Under this management there is no sign of woody branches sticking out from the tree, as of old; but an apple or pear tree is as close dressed as a peach. In shortening shoots of apples and pears in September, he takes no precautions; but for cherries and other fruits, he never omits to touch the tip of the shoot where cut over, with a brush dipped in lime, made of a due thickness for that purpose, and every wound at the last pruning is covered in the same manner, for kernel fruit as well as stone fruit. Mr Forsyth is in general very desirous of keeping all the wood on his trees young; and when the branches begin to get old, he cuts them off where a favourable shoot pushes forth, and reserves it perhaps for two seasons without touching it; and then cuts out the old branch, and lays this one in its stead. You will observe, that he never shortens any of the shoots along the wall for the purpose of bearing fruit, so that they have fewer branches, and are more ramifications of any sort, than is usual in the case; and these branches, when thus left to live, throw out more fruit buds and fewer leaves than they otherwise would have done. He also, that as Kensington gardens are richly manured, though the soil be not naturally favourable, tends greatly to the production of fruit. Mr Forsyth considers it as the inevitable ruin of a garden to be poor; nor does he imagine it possible to give it too much manure, if the production of fruit be the object aimed at. These, I think, are the principal hints that I have been able to pick up from Mr Forsyth, in going several times through the garden with him. He is, you will perceive, very communicative; but it takes some time for a person, who is not acquainted with the subject, to acquire consistent and correct notions of it."

3. FRUIT-TREES, Mr FORSYTH'S RECIPE FOR CURING THE DISEASES OF. Mr Forsyth received a reward from his majesty for publishing the following composition for curing diseases and injuries in all kinds of fruit and forest trees; with his method of preparing the trees, and laying on the composition. "Take one bushel of fresh cow dung, half a bushel of lime rubbish of old buildings, (that from the ceilings of rooms is preferable,) half a bushel of wood ashes, and a 16th part of a bushel of pit or river sand; the 3 last articles are to be sifted fine before they are mixed; then work them well together with a spade, and afterwards with a wooden beater, until the stuff is very smooth like fine plaster used for the ceilings of rooms. The composition being thus made, care must be taken to prepare the tree properly for its application, by cutting away all the dead, decayed, and injured part, till you come to the fresh, sound wood, leaving the surface of the wood very smooth, and rounding off the edges of the bark with a sharp knife, or other instrument, perfectly smooth, which must be particularly attended to: then lay on the plaster about one 8th of an inch thick, all over the part where the wood or bark has been so cut away, finishing off the edges as thin as possible; then take a quantity of dry powder of wood ashes, mixed with a 6th part of the same quantity of the ashes of burnt bones; put it into a tin box with holes in the top, and shake the powder on the surface of the plaster, till the whole is covered over with it; letting it remain for half an hour to absorb the moisture. Then apply more powder, rubbing it on gently with the hand, and repeating the application of the powder, until the whole plaster becomes a dry smooth surface. All trees cut down near the ground should have the surface made quite smooth, rounding it off in a small degree, and the dry powder directed to be used afterwards should have an equal quantity of powder of alabaster or stucco, commonly called *Paris plaster stone*, mixed with it, in order the better to resist the dripping of the trees and heavy rains. If any of the composition be left for a future occasion, it should be kept in a tub or other vessel, and urine, or *slate* of any kind, poured on it, so as to cover the surface, otherwise the atmosphere will greatly hurt the efficacy of the application. Where lime rubbish of old buildings cannot be easily got, take pounded chalk, or common lime *after having been slacked a month or so*. As the growth of the tree will gradually affect the plaster, by raising up its edges next the bark, care should be taken, where that happens, to rub it over with the finger when occasion may require, (which is best done when moistened by rain,) that the plaster may be kept whole to prevent the air and wet from penetrating into the wound."

(V.) FRUIT-TREES, Mr F. D. S. BUCKNALL'S COMPOSITION FOR CURING THE CANKER OF. "Take one 4th oz. of the corrosive sublimate, reduced to a fine powder by beating it with a wooden pestle or hammer, and then put it into a 3 quart earthen pipkin, with about a glass-full of gly, or other spirits, stirred well together, and the sublimate thus dissolved: the pipkin to be then filled with vegetable or common water, and the mixture stirred, till the mixture is blended together as

completely as possible. This quantity will be sufficient for 200 fruit trees."

(1.) * **FRUMENTACEOUS**. *adj.* [from *frumentum*, Lat.] Made of grain. *Diſt.*

(2.) **FRUMENTACEOUS** is applied by botanists to all such plants as have a conformity with wheat, in their fruits, leaves, ears, or the like.

FRUMENTARI, a kind of soldiers or archers under the western empire. The first mention we find made of these officers is in the reign of the emperor Adrian, who made use of them to inform himself of whatever passed. They did not make any particular corps distinct from the rest of the forces, but there was a certain number of them in each legion. It is supposed, that they were at first a number of young persons, disposed by Augustus throughout the provinces, particularly on all the grand roads, to acquaint the emperor, with all expedition, of every thing that happened. Afterwards they were incorporated into the troops themselves, where they still retained their ancient name. As their principal office was the giving intelligence, they were often joined with the *CURIOSES*, with whom they agreed in this part of their office. Their name is derived from their being also a sort of purveyors to the armies, cities, &c. collecting the *corn* from the several provinces.

FRUMENTATION, in Roman antiquity, a largess of corn bestowed on the people. This practice of giving corn to the people was very ancient among the Romans, and frequently used to sooth their turbulent humour. At first the number of those to whom this largess was given was indeterminate, till Augustus fixed it at 200,000.

FRUMENTIUS, *ST*, the first who preached the gospel in Ethiopia, except the eunuch who was converted by St Philip. (Acts, viii. 27.) Frumentius was ordained bishop of Ethiopia, by St Athanasius, A. D. 331. See **ETHIOPIA**, § 15.

* **FRUMENTY**. *n. s.* [from *frumentum*, corn, Lat.] Food made of wheat boiled in milk.

* **To FRUMP**. *v. a.* To mock; to browbeat. *Skinner. Ainsw.*

(1.) * **FRUSH**. *n. s.* [from the verb.] A sort of tender horn that grows in the middle of the sole, and at some distance from the toe: it divides into two branches, running towards the heel, in the form of a fork. *Farrier's Diſt.*

(2.) **FRUSH**. See **FARRIERY**, Part V, Sect. IX.

* **To FRUSH**. *v. a.* [from *froisser*, French.] To break, bruise, or crush. *Hanmer.*—

I like thy armour well;

I'll *frush* it, and unlock the rivets all,

But I'll be master of it. *Shakesp. Troil. & Cress.*

FRUSTRANEA POLYGAMIA. See **BOTANY**, § 194.

* **FRUSTRANEOUS**. *adj.* [from *frustra*, Latin.] Vain; useless; unprofitable; without advantage.—Their attempts being so *frustraneous*, and the demonstrations to the contrary so perspicuous, it is a marvel that any man should be zealously affected in a cause that has neither truth nor any honest usefulness in it. *More.*—He timely withdraws his *frustraneous* baffled kindnesses, and sees the folly of endeavouring to stroke a tyger into a lamb, or to court an Ethiopian out of his colour. *South.*

* **FRUSTRATE**. *participial adj.* [from the

verb.]

1. Vain; ineffectual; useless able.—

He is drown'd

Whom thus we stray to find, and the
Our *frustrate* search on land. *S.*

—The ruler of the province of Jude order of Julian buſied in the re-edifying temple, flaming balls of fire iſſuing near dation, and oft consuming the workmen enterprize *frustrate*. *Raleigh's Hiſt.*—

All at once employ their thronging
But out of order thrown, in air they
And multitude makes *frustrate* the d

Dry.

2. Null; void.—Few things are so restrained one end or purpose, that, the same being they should forthwith utterly become *Hooker.*

* **To FRUSTRATE**. *v. a.* [from *frustror*, Lat. Fr.] 1. To defeat; to disappoint; to It is an axiom of nature, that natural not utterly be *frustrate*. *Hooker.*—

I survive,

To mock the expectations of the world
To *frustrate* prophecies, and to raze
Rotten opinion. *Shakeſp.*

Stern look'd the fiend, as *frustrate*
Not half ſuffic'd, and greedy yet to l

Not more almighty to resist our might
Than wise to *frustrate* all our plots and

2. To make null; to nullify.—The actment, which gave all his lands to the church cut off and *frustrate* all such conveyances

Now thou haſt aveng'd

Supplanted Adam; and by vanquishing
Temptation, haſt regain'd loſt paradice
And *frustrated* the conquest fraudulent

—The peculiar strength of the motive self perhaps contribute to *frustrate* the cause it, rendering it liable to be suspected whom it is addressed. *Atterbury.*

* **FRUSTRATION**. *n. s.* [from *frustror*, from *frustrate*.] Disappointment; it states notoriously irreligious, a secret and able power countermands their deepest splits their counsels, and smites their policies with *frustration*. with a curse. *South.*

* **FRUSTRATIVE**. *adj.* [from *frustror*, from *frustrate*.] Disappointing. *Ainsw.*

* **FRUSTRATORY**. *adj.* [from *frustror*, from *frustrate*.] That which makes any procedure void which vacates any former process.—But strains this to a *frustratory* appeal. *Ainsw.*

(1.) * **FRUSTUM**. *n. s.* [Latin.] A part cut off from a regular figure. A term of science

(II.) **FRUSTUM**, in mathematics, a part of a solid body separated from the rest. *Th.*

1. **The FRUSTUM OF A CONE** is the part that remains when the top is cut off by a plane parallel to the base; and is otherwise called *truncated cone*.

2. **The FRUSTUM OF A GLOBE**, or of any part thereof cut off by a plane, the contents of which may be found by multiplying the sum of the squares of the radii of the base and top, and the square of the height, by three times the square of the semidiameter of the base, and dividing the product by eight.

sum by the height, and this product multiplied by 6 gives the solidity of the frustum. **FRUSTUM OF A PYRAMID** is what remains when the top is cut off by a plane parallel

FRAX, a SHRUB. Shrubs, according to Linnaeus, make a branch of the 7th family in the kingdom; and are distinguished from trees in that they come up without buds. But this distinction is not universal, though it be general with regard to those of Europe. Nature made no absolute distinction between trees and shrubs. *Frutex*, in its general acceptation, is a plant whose trunk is perennial, gemmiferous, dividing and subdividing into a number of branches. In short, it is the epitome of a tree, exemplified in the rose-bush.

FRIGEN, a town and ci-devant bailiwick of the Helvetic republic, in the late canton of Fribourg, S. of Spietz, and 30 SE. of Fribourg.

FRUOR, a name of Venus, [from *fruo*, to enjoy,] a name of Venus.

FRYSK, n. f. [from *free*, foam, Danish. *Skin*.] The swarm of little fishes just produced from the spawn.—

—Come to us, but as love draws;
—Shows us, and never chaws;
—As by chain'd shot, whole ranks do
—Die;
—A tyrant pike, and we the fry. *Donne*.
—With the sounds and seas, each creek
—A bay,

—A innumerable swarm and shoals
—That with their fins and shining scales
—Under the green wave in sculls, that oft
—Come and go mid sea. *Milton's Par. Lost*.

—The elder had the hap to draw up a very little
—Among the fry. *L'Estrange*.—

—Behind some promontory lie
—The leviathans, t' attend their prey;
—There are no chace, but swallow in the fry,
—Who'er their gaping jaws mistake the way.

—*Dryden*.
—A swarm of animals; or young people in
—A fry.—Out of the fry of those rakehell horse-
—Flinging up in knavery and villany, are their
—Usually supplied and maintained. *Spenser*.—

—A fry before the fry of children young,
—When sports and childish mirth did play,
—The maidens sounding timbrels sung.

—*Fairy Queen*.

—I see no constellations there,
—Nor goat, nor bull, nor bear;
—Nor that monstrous fry
—That rock the sky. *Oldham*.

—A fry must be held at a distance, and
—Under the discipline of contempt. *Collier*.

FRY, n. f. A kind of sieve.—He dresseth
—The malt, by running it through a fan
—*Butcher's Highway*.

FRY, n. f. [from the verb.] A dish of
—Fry.

FRY, v. a. [from *frigo*, Lat. *frigo*, Welsh;
—To dress food by roasting it in a
—Fire.

—*Past I.*

(2.) * **To Fry, v. n.** 1. To be roasted in a pan
—on the fire. 2. To suffer the action of fire.—

—So when with crackling flames a cauldron
—*fries,*

The bubbling waters from the bottom rise;
—Above the brims they force their fiery way,
—Black vapours climb aloft, and cloud the day.

—*Dryden's Æn.*

3. To melt with heat.—

—Spices and gums about them melting fry,
—And, phoenix like, in that rich nest they die.

—*Waller*.

4. To be agitated like liquor in the pan on the fire.
—Oil of sweet almonds, newly drawn with sugar,
—and a little spice, spread upon bread toasted, is
—an excellent nourisher; but then, to keep the oil
—from frying in the stomach, drink mild beer after
—it. *Bacon's Nat. Hist.*—

—Where no ford he finds, no water fries,
—Nor billows with unequal murmurs roar,
—But smoothly slide along, and swell the shore,
—That course he steer'd. *Dryden's Æn.*

FRYBERG, a town of Bohemia, in the circle
—of Prachatz, 9 miles W. of Rosenberg.

* **FRYINGPAN, n. f.** [from *fry* and *pan*.] The ves-
—sel in which meat is roasted on the fire.—If I pass
—by the sea, I may chance to fall from the frying-
—pan into the fire. *Hoguel's Voc. For.*—We under-
—stand by our of the fryingpan into the fire, that
—things go from bad to worse. *L'Estrange*—A free-
—man of London has the privilege of disturbing a
—whole street with the twanking of a brass kettle,
—or a fryingpan. *Spectator*.

FRY'S BAY, a bay on the SW. coast of Antigua.

(1.) **FRYTH, John,** a martyr to the Protestant
—religion, under Henry VIII. He was the son of
—an innkeeper at Seven-oaks in Kent; and educa-
—ted in the king's College, Cambridge, where he
—took the degree of B. A. Thence he removed to
—Oxford, and was made a junior canon of Wolfey's
—college. He there became acquainted with Wil-
—liam Tyndale, a zealous Lutheran, who converted
—him to Lutheranism. Avowing his opinions pub-
—licly, he was apprehended, examined, and con-
—fined to his college. At length having obtained
—his liberty, in 1528, he went over to Germany,
—where he continued about two years, and then
—returned to England. At last he was taken up at
—Reading as a vagrant, and set in the stocks, where
—he remained till he was nearly expiring for want
—of sustenance. He was at length relieved by the
—humanity of Leonard Cox, a schoolmaster, who
—procured his enlargement, and supplied his wants.
—He then set out for London, where he began to
—make proselytes, but was apprehended by order
—of Sir Thomas More, and sent prisoner to the
—Tower. Refusing to recant, he was burnt in
—Smithfield, on the 4th July 1533. He left several
—works, which were printed in folio, in 1573.

(2.) **FRYTH, a village in Middlesex,** between
—Barnet and Mill hill.

FUAGE, n. f. in old English writers, a tax of
—12d. for every fire, levied in the time of Edw. III.

* **FUB, n. f.** A plump chubby boy. *Shakspeare*.

* **To FUB, v. a.** To put off; to delay by false
—pretences; to cheat. It is generally written *fo*.
—See *FOS*.—A hundred mark is a long loan for a

poor lone woman to bear? and I have born, and born, and born, and have been *subb'd* off and *subb'd* off from this day to that day, that it is a shame to be thought on. *Shakesp. Henry IV.*

* FUCATED. *adj.* [*fucatus*, Latin.] 1. Painted; disguised with paint. 2. Disguised by false show.

FUCECCHIO, a town of Italy, in Tuscany, 18 miles SSW. of Pistoia.

FUCHSWINKE, a town of Silesia, in Neisse.

(1.) FUCINUS, in ancient mythology, the god of the lake is named. His temple stood on its banks.

(2.) FUCINUS LACUS, in ancient geography, a lake of Italy in the country of the Marsh, now called CELANO, from a cognominal citadel, in the S. of Abruzzo Ultra. According to the testimony of ancient authors, it was subject to extraordinary risings and decreasings. The actual circumference is 47 miles: the breadth in the widest part is 10, in the narrowest 4; its depth 12 feet upon an average. But all these have varied prodigiously. Two miles up the plain, behind Avezzano, the fragments of boats, shells, and other marks of its ancient extent, have been casually discovered: and, on the other hand, there are people who remember when it did not flow nearer than within two miles of Avezzano. An immense tract of excellent land is lost at every increase of its level. All round this noble piece of water rises a circle of grand mountains, some of them the highest in Italy, except the Alps, and many of them covered with snow. At the foot of them are numerous villages with rich and well cultivated farms. The environs of the lake, Mr Swinburn describes as all well inclosed, and the sides of the hills as covered with fine woods; its waters abound with fish of various kinds, and thither repair at stated seasons innumerable flights of wild fowls. As the swelling of the lake was attended with incredible damage, the Mariti had often petitioned the senate to drain it; Julius Cæsar would have attempted it, had he lived longer. His successors were averse to the project, until Claudius, who delighted in expensive difficult enterprises, undertook it. During the space of 11 years he employed 50,000 men in digging a passage through the mountain; and when every thing was ready for letting off the water, exhibited a superb naval spectacle on the lake. A great number of condemned criminals were obliged to act the parts of Rhodians and Sicilians in separate fleets; to engage in earnest, and to destroy one another, for the entertainment of the court and the multitude of spectators that covered the hills. A line of well armed vessels and rafts loaded with soldiers surrounded the scene of action, to prevent any of the wretches from escaping; but it was with great difficulty and many threats that they could be brought to obey. When this savage diversion was ended, the operations for opening the outlet commenced, and the emperor was very near being swept away and drowned, by the sudden rushing of the water. However, either through the ignorance or negligence of the engineers, the work did not answer as was expected, and Claudius did not live long enough to have the fault amended. Nero abandoned the scheme through envy. Adrian is said to have let off the

waters of the Fucinus; but none now except thro' hidden channels formed by nature are probably subject to be obstructed, occasion a superabundance of water until some unknown cause remove the obstruction and again give free passage. Sir William ton, who visited the Fucinus in 1785, is the most beautiful lake he ever saw would be complete if the neighbouring rivers were better wooded. It furnishes abundance of fish, though not of the best quality. A few large trouts, with many tenches and dace. In the shallow water on the side of the lake, he saw thousands of water frogs feeding and preying upon a little kind of snail or thornbacks, but much better armed than their defensive weapons seemed to avail little against such ravenous foes. Claudius let he describes as still entire, though filled with earth and rubbish in many parts. He filled it with torches as far as he could. It was a covered canal, three miles long, and part through hard rock; and other parts supported by mason work, with wells to give light. He is said to have let off the waters of the lake. Our author is of opinion, that, if the canal were cleared and repaired, it would still answer its purpose, and thereby restore a great deal of land fit for cultivation.

(1.) * FUCUS. *n. s.* [Latin.] Paint for women. Not now in use —

Women chat

Of *fucus* this, and *fucus* that. B. — Those who paint for debauchery show the *fucus* pulled off, and the coarseness undiscovered. *Collier.*

(II.) FUCUS, in antiquity, a name given to certain dyes and paints; particularly to a plant used to dye woollens and linens of a blue. The dye, says Theophrastus, was useful, but not lasting; for it soon began to fade and in time went wholly off. The women used something called *fucus*, to stain the red; and many have supposed, from the word expressing both, that the same was used on both occasions. But this inquiry, proves not to be the case. The word called every thing *φαειν* that would stain the flesh. But this peculiar substance, the women to paint their cheeks, was distinguished from the others by the name of *κρίν* the more correct writers, from *κρίνον*, a lily, was indeed a root brought from Syria into Italy. The Latins, in imitation of the Greek called this root *radicula*; and Pliny erroneously founds the plant with the *radix liliaria*, the lily roots. The name *fucus* was in the such an universal name for paint, that the Greeks and Romans had a *fucus metallicus*, which was used for painting the neck and arms, after which they used the *purpura*, or of the *rizion* to give the colour to the face. In after-times they also used a *fucus* or the purpose, prepared of the *Crocus*, orange silver chalk, and some of the rich purple were in use at that time: and that seems to have been very little different from our rouge-pour used on like occasions.

Fucus, in botany, a genus of the morder of alga, belonging to the cryptogamous plants. All the species afford a pure alkaline salt. The most remarkable is the following.

Fucus CILIATUS, the ciliated or ligulated fucus, is found on the shores of Iona and other parts; it is not common. The colour is red, the substance membranous and pellucid, without veins; the ordinary height of the whole is about 4 or 5 inches. It is variable in its appearance according to the different stages of its growth. It is eaten by the Scots and Irish people, with dill. See No 5.

Fucus ESCULENTUS, the eatable fucus, or kelp, commonly called tangle in Scotland, is a native of the British shores. It is about 4 feet long, and 7 or 8 inches thick; sometimes found 3 yards or more in length and a foot in width. Small specimens are about 1 foot long, and two inches broad. The substance is thin, membranaceous, and pellucid, green or olive. The root consists of cartilaginous fibres. The stalk is about 1 foot long and half an inch wide, nearly square, situated in the middle between the root and the leaf, with 10 or 12 pairs of thick, jointed, oval obtuse, foliaceous ligaments, about 2 inches long, and crowded together. The leaf is of an oval lanceolate, or long elliptic shape and undivided, waved on the edges, and is ribbed in the middle from bottom to top, a rib running through its whole length, lying out on both sides of the leaf. It is eaten by the N. both by men and cattle. Its proper season is Sept. when it is in perfection. The root part is rejected, and the stalk only is used. It is recommended in the disorder called dyspepsia to strengthen the stomach, and restore the

Fucus FILUM, the thread fucus, or sea-maid, is found on the sea rocks, waving under the long strings, on many parts of the coast. The substance is opaque and cartilaginous, but eaten. The colour, when recent, is a dull olive; when dry, fuscous, or nearly black; and exposed for some time on the shores to wind and air, it becomes yellow, straw colour, &c. It consists only of a simple, naked, cylindrical stalk, 3 or 4 yards long, or less, from the size of a large adder's tail to that of a thick whip cord; smallest at the summit; smooth on the outside, full of mucous matter; often twisted, and always intercepted by transverse diaphragms, visible when the stalk is held between the eye and the light. The divisions have not yet been discovered; but the transverse septa in its structure, it is reasonable to suppose this plant to belong rather to the class of conserva than that of fucus. The stalk is eaten when half dry, and twisted, and is considered a degree of strength and health, that it is said, the Highlanders use them for the same intentions as Indian grass.

Fucus GIGANTEUS, the gigantic fucus, is found in the Straits of Le Maire; and grows on the ground, which in those countries is distant from sand or ouze by the enormous

length of the sea weeds that grow upon it. The stalks are 4 feet long, and some of the stalks, though not thicker than a man's thumb, are 12 in. Sir Joseph Banks and Dr Sanderford found some of them which were 84 feet long, and as they made a very acute angle with the bottom, they were thought to be at least one half longer.

Fucus PALMARIS, the palmated or forest fucus, commonly called *dill* or *dillie*, grows plentifully on our sea coasts, and is used. Its substance is membranaceous, thin, and pellucid; the colour red, sometimes green with a little mixture of red; its length generally about 5 or 6 inches, but varies from 3 to 12. It is fan shaped, or gradually ciliated from the base upwards. Its divisions are extremely various. The inhabitants both of Scotland and England take pleasure in eating this plant; and women of weak habits often recover an appetite by eating it raw. The inhabitants of the Archipelago also are fond of it, as we learn from Storer. They sometimes eat it raw, but esteem it most when added to ragouts, omelets, &c. to which it gives a red colour; and, dissolving, renders them thick and gelatinous. In the Isle of Skye, it is sometimes used in fevers to promote a sweat, being boiled in water with butter. In this manner it also frequently purges. The dried leaves infused in water, exhale the scent of violets.

Fucus PINNATIFIDUS, the jagged fucus, or pepper dillie, is frequent on sea rocks which are covered by the tides, both on the E. and W. coasts. It is of a yellow olive-colour, often tinged with red. The substance is cartilaginous, but tender and transparent; the height about 2 or 3 inches. This species has a hot taste in the mouth, and is therefore called *pepper dillie*, in this country. It is often eaten as a salad, like the preceding.

Fucus PLICATUS, the matted or Indian grass fucus grows on the sea shores in many places of Scotland and England. It is generally about 3 or 4, sometimes 6 inches long. Its colour, after being exposed to the sun and air, is yellowish, or ashy; its substance pellucid, tough, and horny, so as to bear a strong resemblance to what the anglers call *Indian grass*, that is, the tendrils issuing from the ovary of the daisy.

Fucus PECTINATUS, the peckin' fucus, is frequent on the sea rocks, and in basins of water left by the retreats of the tides. Its natural colour is a most beautiful bright red or purple, but is often variegated with white or yellow. Its substance is cartilaginous, but extremely thin, delicate and transparent; its height commonly about 3 or 4 inches. The stalk is compressed, about half a line in diameter, erect, but waved in its growth, and divided almost from the base into many wide expanded branches. These primary branches are very long, alternate, exactly like the stalk, and subdivided into alternate secondary branches, which are again frequently compounded in the same manner, and these divisions decorated with subulated teeth, growing in alternate rows, curiously pectinated or toothed on the upper side like a comb, the smallest of these teeth scarcely visible to the naked eye. The modifications are minute spherical capsules, or smooth dark-red globules, scattered without order on the sides of the branches;

ches; generally sessile, but some few of them supported on short peduncles. This species, on account of its elegant colours and fine divisions, is the species most admired by those who are fond of pictures and mimic landscapes, composed of marine vegetables.

9. *FUCUS PROLIFER*, the proliferous fucus, is found on the shores of the western coast, adhering to shells and stones. The colour is red; the substance membranaceous, but tough, and somewhat cartilaginous, without rib or nerve, though thicker in the middle, than at the edges. Its whole length is about 4 or 5 inches, the breadth of each leaf about a quarter of an inch. The growth of this fucus, when examined with attention, appears to be extremely singular and wonderful. It takes its origin either from a simple, entire, narrow, elliptic leaf, about an inch and a half long; or from a dilated forked one, of the same length. Near the extremity of the elliptic leaf, or the points of the forked one (but out of the surface, and not the edge), arises one or more elliptic forked leaves, which produce other similar ones, in the same manner, near the summits; and so on continually one or more leaves from the ends of each other, in a proliferous and dichotomous order, to the top of the plant; which in the manner of its growth much resembles the cactus opuntia, or flat-leaved Indian fig. Sometimes 2 or 3 leaves, or more, grow out of the middle of the disc of another leaf; but this is not the common order of their growth. The fructifications are red, spherical, rough warts, less than the smallest pin's head, scattered without order on the surface of the leaves. These warts, when highly magnified, appear to be the curled rudiments of young leaves; which in due time either drop off and form new plants, or continue on and germinate upon the parent. The plant is very much infested with the *flustra pilosa*, the *mandrepore verucaria*, and other corallines, which make it appear as if covered with white scabs.

10. *FUCUS SACCHARINUS*, the sweet fucus or sea belt, is very common on the sea coast. Its substance is cartilaginous and leathern; and the leaf is quite ribless. By these characters it is distinguished from the *FUCULENTUS*, (See N^o 2.) to which it is nearly allied. It consists only of one simple, linear, elliptic leaf, of a tawny green colour, about 5 feet long, and 3 inches wide in its full-grown state; but varies to exceedingly as to be found from a foot to 4 yards in length. The ordinary length of the stalk is two inches, but it varies even to a foot. The root is composed of branched fibres, which adhere to the stones like claws. This plant is often infested with the *fertularia ciliata*. The inhabitants of Iceland make a kind of pottage of it; boiling it in milk, and eating it with a spoon. They also soak it in fresh water, dry it in the sun, and then lay it up in wooden vessels, where it is soon covered with a white efflorescence of sea salt, which has a sweet taste like sugar. This they eat with butter; but if taken in too great a quantity, the salt is apt to irritate the bowels and bring on a purging. Their cattle feed and get fat upon this plant, both in its recent and dry state; but their flesh acquires a

bad flavour. It is sometimes eaten by the people on the coast of England, boiled as a pot-herb.

11. *FUCUS SERRATUS*, the serrated fucus, sea wrack, is frequent at all seasons upon the rocks at low water mark, but produces its fruit in July and August. It consists of a flat, radiate and dichotomous leaf, about two feet long; branches half an inch wide, serrated on the edges with dents of unequal size, and at unequal distances, having a flat stalk or rib divided like the branches, and running in the middle of it through all its ramifications. A small species of coralline, called by Linnæus, *Sertularia pumila*, frequently grows along the leaf. This species affords a much smaller quantity of alkaline salt than most others, the ashes yielding only 3 of fixed salt. The Dutch cover their crabs and lobsters with this fucus to keep them alive and moist; and prefer it to any other, as being destitute of those mucous vesicles with which some of the rest abound, which would sooner ferment and become putrid.

12. *FUCUS VESICULOSUS*, the bladder fucus, common sea wrack, or sea ware, grows in great abundance on the sea rocks about low water mark, producing its fructifications in July and August. It has the same habit, colour, and substance as the foregoing, (N^o 11); but the edges of the leaves have no serratures, being quite entire; in the middle or surface are immersed hollow, spherical, or oval air-bladders, hairy within, growing generally in pairs, but often single in the angles of the branches, which are probably destined to buoy up the plant in the water; and on the extreme segments of the leaves, appear tumid vesicles about $\frac{1}{4}$ of an inch long, sometimes oval and in pairs, sometimes single and bifid, with a clear viscid mucus interspersed with downy hairs.—This species is an excellent manure for land; for which purpose it is often applied in the maritime parts of Scotland and other countries. In the islands of Jura and Skye it serves as a winter food for cattle, which regularly come down to the shores at the recess of the tides to seek it. And sometimes even the stags, after a storm, descend from the mountains to the sea-shores to feed upon it. Linnæus informs us, that the inhabitants of Gotland boil it in water and mixing a little coarse meal or flour, feed the hogs with it; for which reason they call the plant *svintang*. And in Seana, he says, the poor people cover their cottages with it, and sometimes use it for fuel. In Jura, and some other of the Hebrides, the inhabitants dry their cheeses without salt, by covering them with the ashes of this plant; which abounds with such a quantity of salts, that from 5 oz. of the ashes, may be procured $2\frac{1}{2}$ of fixed alkaline salts. But the most beneficial use, to which the fucus vesiculosus is applied, is in making pot-ash, or KELP, a ware much practised in our Western Isles. There is a great difference in the goodness and price of this commodity, and much care and skill required in properly making it. That is esteemed the best which is hardest, finest grained, and free from sand or earth. The price of kelp in Jura is 10s. per ton, and about 40 or 50 tons are exported annually from that island. So great a value is set upon this plant by the inhabitants, that the

its of rocks and huge stones into the case the growth of it. Its medical virtues much celebrated by Dr Ruffel, in *his opinion concerning the use of Sea water in of the Glands*. He found the saponaceous, or mucus, in the vesicles of this plant, an excellent resolvent, extremely serviceable in all scorbutic and scrofulous swellings. He recommends the patient to pour with these vesicles bruised in his ear the mucus has thoroughly penetrated the earwards to wash with sea water. Or, 1 lb. of the tumid vesicles, in July, are full of mucus, and infuse them in sea-water, in a glass vessel, for 15 days, the liquor will have acquired nearly the consistence of honey. Then strain it off through a cloth, and rub this liquor 3 or 4 times a day on hard scrofulous swellings, washing afterwards with sea water, and nothing so efficacious to disperse them. Even the breasts, in women, have been cured by this treatment. By calcining in the open air, he made a very black powder, which he called *vegetable etheops*; a powder used as a resolvent and disobstruction, recommended also as an excellent demulcent to correct the scorbutic laxity of the gums, and the foulness of the teeth.

FUDDLE, *v. a.* [Of unknown etymology.] To make drunk.—

The table floating round,
The men faithless to the *fuddled* feet.

Thomson.

FUDDLE, *v. n.* To drink to excess.—
Whoring and *fuddling* on still. *L'Ecl.*
a small mountainous island of Scotland N. of BARRAY.

FUGO, or **FOGO**, one of the Cape de Verde Islands, in the Atlantic, so named from its being called also St PHILIP, from its having been discovered on St Philip's day. It is 15 miles long and is much higher than any of the islands at sea, to be one single mountain, the sides there are deep valleys. There is a fire at the top which burns continually, and is seen a great way off at sea. It vomits out of fire and smoke, and throws out of its top rocks to a vast height. Sometimes melted lava run down the sides. The first who inhabited it, brought negroes, and a stock of cows, horses, and their descendants are not now distinguishable from the negroes, the chief inhabitants are blacks, and of the Romish religion. *W. Lat.* 15. 10. N.

FOGO, or **TERRA DEL FUEGO**, a large island situated from the S. extremity of America, in the straits of Magellan. (See COOK, N° 1.) It consists of a chain of stupendous mountains, some of which are volcanoes, covered with eternal snow; notwithstanding which the natives go naked, and paint their bodies, and are naturally fair. Those on the S. side are barbarous and treacherous, but those on the N. perfectly simple and harmless. Dr Solander, and others, landed in 1768, which, though the summer

time of the island, was so cold, that two of their company perished by sleeping one night on it. The coast abounds with harbours. *Lon.* from 51. 20. to 58. W. *Lat.* from 52½. to 55. 35. S.

* **FUEILLEMORTE**, *n. f.* [French.] Corruptly pronounced and written *philomote*.—*Fueillemorte* colour signifies the colour of withered leaves in Autumn.

* **FUEL**, *n. f.* [from *feu*, fire, French.] The matter or aliment of fire.—This shall be with burning and *fuel* of fire. *Is.* ix. 5.—

This spark will prove a raging fire,
If wind and *fuel* be brought to feed it with.

Shakspeare. Henry VI.

Mov'd by my charms, with them your love
may cease;

And as the *fuel* sinks, the flame decrease. *Prior*

* **TO FUEL**, *v. a.* [from the noun.] 1. To feed fire with combustible matter.—

And yet she cannot waste by this,
Nor long endure this torturing wrong;

For more corruption needful is,

To *fuel* such a fever long

Donne.

Never, alas! the dreadful name

That *fuels* the infernal flame.

Corley.

The *fuel*'d chimney blazes wide.

Thomson's Aut.

2. To store with firing.—Some are plainly economical, as that the tent be well watered, and well *fuelled*. *Watts's Arith.*

FUELOE, one of the FARO islands.

FUEN, a river of China, which runs into the Hoang, in the province of Chanfi.

FUENCALIANTE, a town of Spain in Old Castile, near the Xalon, 9 miles N. of Sigüenza.

FUENHO, a river of China in Chanfi.

FUENHUA, a city of China, in the province of PEICHILI, celebrated for its extent and the number of its inhabitants, as well as for the beauty of its streets and triumphal arches. It is situated near the great wall, amidst mountains; and has under its jurisdiction 2 cities of the 2d, and 8 of the 3d class, and a great number of fortresses, which bar the entrance of China against the Tartars.

FUENSALIDA, a town of Spain, in New Castile, 18 miles NNW. of Toledo.

FUEN-TCHEOU, or **FUEN-TCHEOU-FOU**, a city of China, of the 1st rank, in the prov. of Chanfi, on the Fuen, famous for its hot baths and springs. It is 280 miles SW. of Pekin. *Lon.* 129. 6. E. of Ferro. *Lat.* 37. 20. N.

(1.) **FUENTE**, a town of Spain in the prov. of Asturia, 20 miles SW. of Santillane.

(2.) **FUENTE DE LA PIEDRA**, a village of Spain, in Granada, 6 miles from Antequiera, famous for its medicinal spring.

(3.) **FUENTE DEL SAHUCO**, or **SAHURRO**, a town of Spain, in Leon, 6 miles from Salamanca.

(4.) **FUENTE DUEGNA**, a town of New Castile, on the Tagus, 24 miles SE. of Madrid.

(5.) **FUENTE EL OLMO**, a town of Spain, in Old Castile, between Segovia and Aranda.

(6.) **FUENTE GINALDO**, a town of Spain, in Estremadura, 16 miles NW. of Coria. It was plundered by the Portuguese, in 1734.

(7.) **FUENTE OVEJUNA**, a town of Spain, in Cordova, 32 miles NW. of Cordova.

FUEN-

FUENTELESO, a town of Spain, in Old Castile, 32 miles N. of Avila.

(1, 2.) **FUENTES**, two towns of Spain; 1. in Arragon, on the Ebro, 20 miles SSE. of Saragossa: 2. in Leon, 13 miles NW. of Palencia.

(3.) **FUENTES DE ONORO**, a town of Spain, in Leon, 13 miles W. of Ciudad Rodrigo.

FUERSBRUNN, a town of Germany, in Austria, 2 miles NE. of Haderstorf.

FUERTEVENTURA, or **FORTAVENTURA**, one of the Canary islands, consisting of two peninsulas, joined by an isthmus 12 miles broad. It is 50 miles long according to Mr Cruttwell, but 65 according to Dr Brookes, and from 8 to 24 broad. The soil is fertile, producing wheat, barley, mastic, orchel, dates, olives, and various other fruits; particularly a species of fig tree, that yields a medicinal pulp as white as milk. It abounds in cattle and goats: 50,000 kids being bred annually. Lon. 14. 32 W. Lat. 28. 4. N.

FUERTY, a town of Ireland, in Roscommon.

FUSSEN, or **FUSSEN**, a town of Suabia, in the bishopric of Augsburg, on the Lech. In 1745, peace was settled here between Austria and Bavaria. It is 47 miles E. of Augsburg, and 65 E. of Constance.

FUFETIUS. See **METIUS SUFFETIUS**.

* **FUGACIOUS**. *adj.* [*fugax, fugacis*, Latin.] Volatile.

* **FUGACIOUSNESS**. *n. f.* [*fugax*, Latin.] Volatility; the quality of flying away.

* **FUGACITY**. *n. f.* [*fugax*, Latin.] 1. Volatility; quality of flying away.—Spirits and salts, which, by their *fugacity*, colour, smell, taste, and divers experiments that I purposely made to examine them, were like the salt and spirit of urine and foot. *Boyle*. 2. Uncertainty; instability.

FUGALIA, in Roman antiquity, a feast supposed by some to be the same with the **REGIVRUM**, held on the 24th of February, in memory of the expulsion of the kings, and the abolition of monarchy. Others think, that the *fugalia* was the same with *poplifugia*, or the feast of **FUGIA**, the goddess of joy, occasioned by the rout of an enemy; which was the reason the people abandoned themselves to riot and debauchery.

FUGAS, a river of Africa, which runs into the Indian ocean, near Juba, on the coast of Zanguebar.

FUGGER, Huldric, a liberal encourager of learning, born at Augsburg, in 1526, and descended of an illustrious family, though originally sprung from a weaver. He was chamberlain to Pope Paul III. but afterwards turned Protestant. He spent large sums in purchasing ancient MSS. and getting them printed by the celebrated Henry Stephens. His relations therefore raised an action against him, and got him declared incapable of managing his own affairs. "Thus (says Dr Watkins) what we should call wisdom was decreed by a German court a proof of idiotism." He died at Heidelberg, in 1584, and left his extensive library to the elector Palatine, with a fund to support six poor scholars.

* **FUGH**. *interj.* [perhaps from *feh*.] An expression of abhorrence. Commonly *feh*.—A very filthy fellow: how odiously he smells of his coun-

try garlick! *fugh*, how he stinks of Sp *Don Seb*.

(1.) * **FUGITIVE**. *adj.* [*fugitif*, *Fr* *tivus*, Latin.] 1. Not tenable; not to be detained.—Our idea of infinity is a *fugitive* idea, still in a boundless progress, can stop no where. *Locke*.—

Happiness, object of that waking
Which we call life, mistaking: *fugu*
Of my pursuing verse, ideal shade,

Notional good, by fancy only made
2. Unsteady; unstable; not durable.

apt to fly away.—The more tender a
parts, the leaves, of many of the most
getables, fall off for want of the support
neath: those only which are more tena-
king a shift to subsist without such rec-
ward's Nat. Hist. 4. Flying; running
ger.—

Whilst yet with Parthian blood t
warm,

The *fugitive* Parthians follow.

The Trojan chief

Thrice *fugitive* about Troy wall.

5. Flying from duty; falling off.—Can
daughter enjoy herself, while her pa-
tears? *Clarissa*. 6. Wandering; run-
gabond.—The most malicious surmise
tenanced by a libellous pamphlet of
physician. *Wotton*.

(2.) * **FUGITIVE**. *n. f.* [from the *ad*]
One who runs from his station or duty:
ried men are best friends, best master
vants, but not always best subjects;
light to run away, and almost all *fug*-
that condition. *Bacon*.—

Back to thy punishment

False *fugitive*! and to thy speed ad-
Just with a whip of scorpions I pur-
Thy ling'ring. *Milton*

We understand by some *fugitives*
commanded

The generals to return with victory.
A shameful death, *Dent*

7. One who takes shelter under arms
from punishment.—Too many, being
inheritance, are fled beyond the seas,
live under princes which are her majes-
ty's enemies; and convert and are
with other traitors and *fugitives* the
Spanker on Ireland.—Your royal high-
great and too just, either to want or to
homage of rebellious *fugitives*. *Dryden*
hard to be caught or detained.—

What mule but his can Nature's

Or catch that airy *fugitive*, call'd w

(3.) **FUGITIVE PIECES**, in literature
poems, or other short compositions,
newspapers, magazines, or the like per-
lections; or printed on loose sheets or
so called, because easily lost and soon

* **FUGITIVENESS**. *n. f.* [from *fi*]
Volatility; fugacity.—That divers salt
upon the analysis of many concretes, is
lative, is plain from the *fugitiveness* of
barthorn attending in distillation. *B*
stability; uncertainty.

FUGUE. *n. f.* [French; from *fuga*, Lat.]
, some point consisting of 4, 5, 6, or
number of notes begun by some one
, and then seconded by a 3d, 4th, 5th,
part, if the composition consists of so
beating the same, or such like notes, to
veral parts follow, or come in one after
the same manner, the leading parts still
re those that follow. *Harris*.—The re-
figures have an agreement with the figures
k of repetition and traduction. *Bacon*.
—The skilful organist plies his grave and
icant in lofty *fugues*. *Milt. on Educ.*—

His volant touch
through all proportions, low and high,
did purlu'd transverse the resonant *fugue*.
Milton.

has a race of heroes fill'd the stage,
not by note, and through the gamut rage;
and airs express their martial fire,

in trills, and in a *fugue* expire. *Addis.*
TORE is a piece of music sometimes long-
 sometimes shorter, in which, agreeable to
 harmony and modulation, the composer
 affects : or, in other words, what expresses
 great thought or sentiment of the piece.

it to pass successively and alternately part to another. These are the principles of the fugue; of which some are peculiar; and others common to it with what we call *imitation*. 1. The subject proceeds from the tonic to the dominant, or from the tonic to the tonic, in rising or descending. The fugue finds its response in the part immediately following that which commenced. 2. The response ought to resume the subject in the 2d, 3d, 4th or 5th above or below the key, rise it as exactly as the laws of harmony require; proceeding from the dominant to the tonic, or from the tonic to the dominant, as the subject is introduced from the tonic to the dominant, and moving in a contrary direction when the subject is introduced from the dominant to the tonic. One part may likewise repeat the same subject in the octave or unison ascending; but in that case, it is a repetition rather than a real response. 3. As the octave is divided into two unequal parts, of which the first has 4 gradations descending from the tonic to the dominant, and the other only three in the ascent from the dominant to the tonic, it renders it necessary to have some real change in the expression of the subject, to make some alterations in the response, so as not quit the cords that are essential to the subject. It is a different case when the command is to alter the modulation; for there the effects of the response itself, when taken in a new key, produces the alteration proper for the new key. 4. The fugue should be planned in such a manner, that the response may commence at the close of the best air, so that both the subject and the other may be in part heard at the same time; that, by this anticipation, the subject may seem to be connected with itself, and that the composer may discover it. It is this which is called a *double fugue*. It is absolute necessity, instead of imposing upon the hearers, the change of key, to transpose from one key to another,

without any other restraint than an accompaniment afterwards formed at pleasure. This deserves at best no better name than what the French call *imitation*. See IMITATION. Besides these rules, which are fundamental, there are others, which, though prescribed by taste alone, are not less essential. Fugues, in general, render music more noisy than agreeable; for this reason they are most agreeable in the chorus. As their chief merit consists in fixing the ear on the principal air or subject, which, for this reason, is made to pass incessantly from part to part, and from mode to mode, the composer ought to exert his care in preserving that air always distinct; or to prevent it from being absorbed in, or confounded with, the other parts. To produce this effect, there are two different ways; one in the movement, which must be incessantly contrasted with itself; so that, if the procedure of the fugue be accelerated, the other parts should be more grave and with protracted notes; or, on the contrary, if the motion of the fugue be slow and solemn, the accompaniments must have more and quicker business. The other method is to extend the harmony, by removing the parts at a greater distance from each other; but the others, too nearly approximated to that which contains the subject, should be confounded with it, and prevent it from being distinguished with sufficient clearness; so that what would be an imperfection any where else, becomes here a beauty. The unity of melody should be preserved: this is the great and general rule, which must frequently be practised by different means. The chords must be chosen, and the intervals, so that one particular sound may produce the chief effect; this can only result from the unity of the melody. It will sometimes be necessary to employ voices and instruments of different kinds, that the parts which ought to prevail may be easily distinguished; this is then done, to the necessity of preserving the unity of the melody. Another object of attention, not less necessary, is the different connections of modulation, which are introduced by the procedure and progress of the fugue, to make all these modulations to correspond at the same time with the parts, to connect the whole in its progress by an exact conformity of motion; lest, if one part be in one mode, and another in another, the general harmony should be in some degree, and for that reason should no longer be able to produce simple effects upon the ear, and the pleasure is thereby diminished; which is another reason for preserving the unity of melody. In a word, in every fugue the connection of modulations and modulations is what a composer has most to care in, and the greatest care is to be taken by him, and a great deal of manner is required, and a great deal of study, one may say, to keep the ear from being tired with the repetition of an exercise, and to make it a delightful task. There are several other kinds of fugues; such as the

(b) Process, Product:

[illegible]

from the tonic to the dominant, or from the dominant to the tonic, the counter fugue ought to be heard in descending from the dominant to the tonic, or from the tonic to the dominant, and *vice versa*. Its other rules are exactly like those of the common fugue.

(5.) FUGUE, PERPETUAL. See CANON, § VIII.

FUHME, a river of Saxony, which runs into the Mulda, 2 miles S. of Ragune.

FUHSANAH, a town of Tunis, 110 miles W. of Tunis.

FUHSE, a river of Saxony, which runs into the Allier, near Zell.

FUICHT, or WALDFUCHT, a town of Germany, in Westphalia, 3 miles E. of Susteren.

FUIDENTALL, a town of Silesia, taken by Frederick the Great, in 1741 and 1744.

FUILLEC, a town of France, in the dept. of the Lower Seine, 9 miles W. of Gournay.

FULA. See FOULA and THULE.

FULBECK, a small town in Lincolnshire.

FULBROOK, the name of 4 English villages: 1. in Bucks, SE. of Claydon: 2. in Lincolnshire, near Normanton: 3. in Oxford, N. of Burford: 4. near Warwick, *on the Avon*.

* FULCIMENT. *n. s.* [*fulcimen, fulcimentum*, Lat.] That on which a body rests, which acts or is acted upon at each end, as a balance or a lever. —The power that equiponderates with any weight must have the same proportion unto it, as there is betwixt their several distances from the center or *fulciment*. *Wilkins*.

(1.) FULCRUM, in mechanics, the prop or support by which a lever is sustained.

(2.) FULCRUM, in botany. See BOTANY, *Index*.

(1.) FULDA, or FULDE, an episcopal principality of Germany, in the circle of the Upper Rhine, bounded on the N. by Hesse cassel, E. by Henneberg, S. by Wurzburg, and W. by Isenburg and Hesse. It is 40 miles long, and from 7 to 25 broad; and is full of woods, mountains, medicinal springs, and rich arable lands. It was only erected into a bishopric, in 1752, by Boniface XIV.

(2.) FULDA, a river in the above bishopric, (N^o 1.) which passes by the town, (N^o 3.) and joining the Werra at Minden, they form the WESER.

(3.) FULDA, or } the capital of the above prin-

(3.) FULDE, } cipality, N^o 1. It has a celebrated abbey, erected by Benedictine Monks, in 744. The abbot is primate of the imperial abbeys, and chancellor to the emperor. It is seated on the river, (N^o 2.) 5 miles S. of Cassel, 58 N. of Frankfurt, and 63 ENE. of Mentz. Lon. 9. 53. E. Lat. 50. 22. N.

* To FULFIL. *v. a.* [*full and fill*.] 1. To fill till there is no room for more. This sense is now not used.—

Six gates i' th' city, with massy staples,

And correspondent *fulfilling* bolts,

Sparre up the sons of Troy.

Shakespeare.

2. To answer any prophecy or promise by performance.—They knew him not, nor yet the voice of the prophets which are read every Sabbath day, they have *fulfilled* them in condemning him. *John* xiii. 27.—

The fury bath'd them in each others blood;

Then, having fix'd the fight, exulting
And bears *fulfill'd* her promise to th

genus of birds of the order of grallæ.
convex: the upper mandible fornicated
power at the edge; the lower mandible
behind the tip. The forehead is bald;
et have 4 toes, subpinnated. See *Plate*
ig. 10, 11. There are 25 species; 18 of
ong to the gallinule division, distinguish-
ing the toes furnished with broad scal-
mbranes; and 7 comprehend the coots
e the toes divided to their origin. The
are among the most remarkable:—

CA ATERRIMA, the GREATER COOT, is
size than the common coot, (Nº 2.)
image is blacker. This species is found
ire and Scotland; but is more plentiful
inent, being found in Russia and the
ria very common; also at Selegue and
ouring parts, where they call it *judelle*.
much esteemed.

ICA ATRA, the COMMON COOT, has a
lead, a black body and lobated toes;
ut 15 inches long. They frequent lakes

. **PART. L**

and still rivers; making their nests among the
rushes, with grass, reeds, &c. floating on the wa-
ter, so as to rise and fall with it. They lay 5 or
6 large eggs, of a dirty whitish hue, sprinkled o-
ver with minute deep rust-coloured spots; and it
is said, that they will lay 14 or more. The young
when just hatched are very deformed, and the head
mixed with a red coarse down. In winter they
often repair to the sea, and the channel near South-
ampton is sometimes observed almost covered with
them. They are often brought to that market,
where they are exposed to sale without their fea-
thers and scalded like pigs. This species is not nu-
merous, for vast numbers fall a prey while young to
the buzzards, which frequent the marshes. Their
food is small fish and water insects; but they some-
times eat the roots of the bulrush, and with it
feed their young; they are said likewise to eat
grain. This species is supposed to extend through-
out the old continent, and perhaps the new also.
It inhabits Greenland, Sweden, Norway, Russia,
Siberia, Persia, China, and many of the interme-
diate parts. It is also met with in Jamaica, Ca-
rolina, and other parts of N. America. The In-
dians about Niagara dress the skins, and use them
for pouches. They are called in Carolina, *Aylerers*.

3. **FULICA CHLOROPUS**, the COMMON GALLI-
NULE, is in length about 14 inches, and has a
bald forehead and broad flat toes. It gets its food
on grassy banks, and borders near fresh waters,
and in the very waters if they be weedy. It builds
upon low trees and shrubs by the water side;
breeding twice or thrice in a summer; and, when
the young are grown up, drives them away to
shift for themselves. The hen lays 7 eggs of a
dirty white, thinly spotted with rust colour. The
gallinule strikes with its bill, and in spring has a
shrill call. In flying, it hangs down its legs; and
in running, it often flirts up its tail, and shows
the white feathers. The bottoms of its toes are
so very flat and broad (to enable it to swim),
that it seems to be the species which connects the
cloven-footed aquatics with the fin-toed. It is
pretty common on the continent, and inhabits
America, from New York to Carolina; as well
as Jamaica and other islands in the W. Indies. It
feeds on plants and small fish, and the flesh is pret-
ty good.

4. **FULICA PORPHYRIO**, the PURPLE GALLI-
NULE, is about the size of a fowl, or 17 inches in
length. The bill is an inch and a half long, and
of a deep red colour. The forehead is bare and
red; the head and hind part of the neck are glos-
sy violet; the legs are very stout, and of the co-
lour of the bill. This species is more or less com-
mon in all the warmer parts of the globe. On
the coasts of Barbary they abound, as well as in
some of the islands of the Mediterranean. In Si-
cily they are bred in plenty, and kept for their
beauty. They are often met with in the S. of
Russia and W. of Siberia, among reedy places;
and near the Caspian sea; but in the cultivated
rice grounds of Ghilar in Persia, they are in great
plenty and high plumage. The female makes the
nest among the reeds in the middle of March;
lays 3 or 4 eggs, and sits from 3 to 4 weeks. That
they are common in China, the Chinese paper

T

Daug.

adings testify. They are also met with in the East Indies, the island of Java, Madagascar, &c. Our late navigators saw them at Tongataboo in vast numbers, as well as in the island of Tanna and other parts. They are also common in S. America. They are very docile, easily tamed, and feed with the poultry; scratching the ground with their feet, like our cocks and hens. They feed on fruits, roots and grain, but eat fish with avidity, dipping them in the water before swallowing. They often stand on one leg, and lift the food to their mouths with the other. A pair of them, kept in an aviary in France, made a nest of small sticks mixed with a quantity of straw, and laid 6 white eggs, perfectly round; but the hen was careless of them, and they produced nothing. The flesh is said to be exquisite.

* **FULIGINOUS.** *adj.* [*fuliginosus* *se*, Fr. *fuliginosus*, Lat.] Sooty; imoky.—Burrage hath an excellent spirit to repress the *fuliginous* vapours of dusky melancholy, and so cure madness. *Bacon*.—Whereas history should be the torch of truth, he makes her in divers places a *fuliginous* link of lies. *Howel*.

FULIGNO. See **FOLIGNI**.

FULIGO, in natural history, a species of pumice stone. See **PUMEX**.

(1.) * **FULIMART.** *n. s.* [This word, of which *Skinner* observes, that he found it only in this passage, seems to mean the same with *float*.] A kind of stinking ferret.—The fichtat, the *fulimart*, and the ferret, live upon the face, and within the bowels, of the earth. *Walton's Angler*.

(2.) **FULIMART**, in zoology. See **MUSTELA**.

FULK, William, D. D. an eminent English divine, born at London, in the 16th century. He was patronised by the E. of Leicester, who, in 1571, presented him to the livings of Warley and Diddington. He attended Leicester, when he went ambassador to France; and on his return was made master of Pembroke hall, and Margaret professor of divinity in Cambridge. His works are very numerous, and chiefly against the Papists; the most noted is his *Comment on the Rhenish New Testament*. He died in 1589.

(1.) * **FULL.** *adj.* [*fulle*, Sax. *vol*, Dut.] 1. Replete; without vacuity; having no space void.—Better is an handful with quietness, than both the hands *full* with travel and vexation of spirit. *Ecc.* iv. 6.—Valley *full* of chariots. *Isaiah*.—The trees of the Lord are *full* of sap. *Psalms*.—

Where all must *full* or not coherent be. *Pope*.

2. Abounding in any quality good or bad.—

With pretence from Strephon her to guard,
He met her full, but *full* of warefulness. *Sidney*.

You should tread a course

Pretty and *full* of view. *Shak. Cymbeline*.

—Followers, who make themselves as trumpets of the commendation of those they follow, are *full* of inconvenience; they taint business through want of secrecy, and export honour from a man, and make him a return in envy. *Bacon*.—

That must be our cure,

To be no more; sad cure; for who would lose,
Though *full* of pain, this intellectual being,
Those thoughts that wander through eternity?

Milton.

Gay religion's *full* of pomp and gold. *Milton*.

In that sweet season, as in bed I lay,
I turn'd my weary side, but still in vain
Tho' *full* of youthful health and void

—He is *full* of wants which he cannot surmount, compassed about with infirmities which he cannot remove. *Tillotson*.—

From yon bright heaven our author
his fire,

And paints the passions that your eyes
Full of that flame, his tender scenes he
And frames his goddesses by your matchless

3. Stored with any thing; well supplied thing.—

Full of days was he;

Two ages past, he liv'd the third to see
4. Plump; saginated; fat.—A gentleman's body having broken his shin by a fall, it was inflamed. *Wiseman's Surg.* 5. Saturated.—I am *full* of the burnt offerings of ram. *i. 11*.—The alteration of scenes feeds an eye, before it be *full* of the same object. 6. Crowded with regard to the imagination.—Every one is *full* of the miracle. cold baths on decayed and weak constitutions. *Lorkc.* 7. That which fills or makes full great in effect.—Water digesteth a *full* nectar than any liquor. *Arbutnot*. 8. Complete as that nothing further is desired or wanted.

That day had seen the *full* accomplishment
Of all his travels. *Daniel's C*

What remains, ye gods,

But up and enter now into *full* bliss?

—Being tried at that time only with a promise, he gave *full* credit to that promise, and the evidence of his fidelity as fast as occasions offered. *Hammond*.—The resurrection from the dead hath given the world *full* of another life. *Tillotson*. 9. Complete abatement; at utmost degree.—At the two *full* years Pharaoh dreamed. *Gen.* hard riding plunge the horses into water, them to drink as they please; but gallop speed, to warm the water in their bellies. 10. Containing the whole matter; expressed.—Where my expressions are not so *full* as your language or my art were desired, where mine are *fuller* than his, they are impressions which the often reading of leave upon my thoughts. *Denham*.—Sho go about with never so set study, to deliver a natural form of the year before the year that which is at present established, he can only do it in so few words, so fit and proper and express. *Woodward*. 11. Strong; not attenuated.—I did never know so great an issue from so empty a heart; but the effort makes the greatest sound. *Shakespeare*.—Entered under the floor of a chamber, making in the same more *full* and resounding. *Nat. Hist.*—

Dryden taught to join

The varying verse, the *full* resounding

12. Mature; perfect.—In the sultanry malukes, slaves reigned over families, and much like were the case, if you sur

re the custom were that after *full* age
ould expulse their fathers out of their
Bacon.—

appears imperfect, and but given
mpose to resign them in *full* time
better covenant.

Milton.

These thoughts
nsel must mature.

Milton.

ed to the moon.] Complete in its orb.
s the *full* moon, as he was coming home
ng, he felt his legs falter. *Wiseman's*
Not continuous, or a full stop.—There-
ded, making a *full* point of a hearty
r. 15. Spread to view in all dimensions.
ut the end of the third century, I do
ber to have seen the head of a Roman
awn with a *full* face: they always ap-
file. *Addison on Medals.*

ULL. *adv.* 1. Without abatement or
1.—

He *full*

lent all his Father manifest

d.
ity of place they are *full* as scrupulous;
y of their criticks limit to that very spot
, where the play is supposed to begin.
Dram. Poesy.—

dest blush she wears, not form'd by art;
m deceit his face, and *full* as free his
rt.

Dryden.

A judicious writer is sometimes mista-
ll his care; but the hasty critick, who
a view, is *full* as liable to be deceived.
ng.—

Since you may
Ey courage, if I should not lay,
m I proffer shall be *full* as good.

Dryd. *Virg.*

e whole effect.—'Tis the pencil, thrown
, upon the horse's mouth, to express the
ch the painter, with all his skill, could
n without it. *Dryd. Dufr.*—

harmony, from heavenly harmony,
verfal frame began:

harmony to harmony,
all the compass of the notes it ran,
ason closing *full* in man.

Dryd.

the centre of the sacred wood,
arise of the Stygian flood.

Addison on Italy.

nineteen sailors did the ship convey;
of nineteen dolphins round her play.

Addis. Ovid.

at her *full*, but full of warefulness. *Sid.*
e then confronts the bull,
his ample forehead aiming *full*,
dly stroke descending pierc'd the skull.

Dryden.

gth resolv'd, he throws with all his force
e temples of the warrior horse. *Æn.*
ed before adverbs and adjectives, to in-
ngthen their signification.—

ie why on your shield, so goodly scor'd,
the picture of that lady's head?

y is the semblant, tho' the substance
L

Spens.

I was set at work

Among my maids; *full* little, God knows,
looking

Either for such men or such business. *Shakesp.*
—*Full* well ye reject the commandment. *Mar. vii. 9.*

Adam was all in tears, and to his guide

Lamenting turn'd *full* sad. *Milt. Par. Lost.*

—You *full* little think that you must be the be-
ginner of the discourse yourself. *More's Div. Dial.*

—*Full* little thought of him the gentle knight.
Dryden.—

Full well the god his sister's envy knew,

And what her aims and what her arts pursue.

Dryden.

—There is a porquiste *full* as honest, by which
you have the best part of a bottle of wine for
yourself. *Swift.*

(3.) * FULL. *n. f.* [from the adjective.] 1.

Complete measure; freedom from deficiency.—

When we return,

We'll see those things affected to the *full*.

Shakesp. Henry VI.

—He liked the pomp and absolute authority of a
general well, and preserved the dignity of it to
the *full*. *Clarendon.*—The picture of Ptolemy
Philopater is given by authors to the *full*. *Dryd.*—

Sicilian tortures, and the brazen bull,

Are emblema, rather than exprels the *full*

Of what he feels.

Dryden's Pers.

If where the rules not far enough extend,

Some lucky licence answer to the *full*

Th' intent propos'd, that licence is a rule.

Pope.

2. The highest state or degree.—

The swan's down feather,

That stands upon the swell at *full* of tide,

Neither way inclines. *Shakesp. Ant. & Cleop.*

3. The whole; the total.—

The king hath won, and hath set out

A speedy pow'r to encounter you, my lord:

This is the news at *full*.

Shakesp. Hen. IV.

But what at *full* I know, thou knowest no part;

I knowing all my peril, thou no art. *Shakesp.*

4. The state of being satiated.—When I had fed

them to the *full*. *Jer. v. 7.* 5. [Applied to the
moon.] The time in which the moon makes a
perfect orb.—Brains in rabbits, woodcocks, and
calves, are fullest in the *full* of the moon. *Bacon's*

Nat. Hist.

(4.) * FULL is much used in composition to
intimate any thing arrived at its highest state, or
utmost degree.

* To FULL. *v. a.* [*fullo*, Latin.] To cleanse
cloth from its oil or grease.

* FULLAGE. *n. f.* [from *full*.] The money
paid for fulling or cleansing cloth.

FULLAN, an inland country of Africa, W. of
Cashna. The dress of the natives resembles our
highland tartan plaids.

* FULL-BLOWN. *adj.* [*full* and *blown*.] 1.
Spread to the utmost extent, as a perfect blossom.

My glories are past danger; they're *full blown*:

Things, that are blasted, are but in the bud.

Denham's Sophy.

My *full-blown* youth already fades apace;

Of our short being 'tis the shortest space.

Dryden's Juvenal.

2. Stretched by the wind to the utmost extent.—

He who with bold Cratinus is inspir'd,
With zeal and equal indignation fir'd;
Who at enormous villany turns pale,
And steers against it with a *full-blown* sail. *Dryd.*

* **FULL-BOTTOMED.** *adj.* [*full* and *bottom.*] Having a large bottom.—I was obliged to sit at home in my morning gown, having pawned a new suit of cloaths and a *full-bottomed* wig for a sum of money. *Guardian.*

FULL-BROOK, a river of Cheshire, which runs into the Wheelock at Maulbon.

* **FULL-EARED.** *adj.* [*full* and *ear.*] Having the heads full of grain.—

As flames roll'd by the winds conspiring force,
O'er *full-ear'd* corn, or torrents raging course.

Denham.

(1.) **FULLER**, Nicholas, prebendary of Salisbury, a learned English critic; who published in 1617 *Miscellanea Theologica* in 4 books, and afterwards two more of *Miscellanea Sacra*. He died in 1623; and there are some MSS. of his remaining in the Bodleian library, that show his great skill in Hebrew and philology.

(2.) **FULLER**, Thomas, D. D. a learned English historian and divine, born at Alwinkle, Northamptonshire, in 1608. He studied at Cambridge, and was chosen minister of St Bennet's there. In his 23d year, his merit procured him a fellowship in Sidney college, and a prebend in Salisbury cathedral. He was afterwards appointed rector of Broad Windsor, and lecturer of the Savoy in London: but upon the pressing of the covenant, he retired to Oxford; and soon after accompanied Hopton as his chaplain in the army, which he attended in their marches. Upon the restoration, he recovered his prebend, was appointed chaplain extraordinary to Charles II, and created D. D. His memory was so amazingly tenacious, that he could repeat a sermon, *verbatim*, if once he heard it. He once undertook, in passing to and from Temple-bar to the Poultry, to tell at his return every sign as it stood in order, on both sides of the way, repeating them either backwards or forwards; and this task he actually performed. He wrote, 1. A History of the Holy War. 2. The Church History of Britain, in folio. 3. Andronicus, or the Unfortunate Politician, in 8vo. 4. A Pisgah sight of Palestine. 5. A History of English Worthies; and other works. He died in August 1661. He was fond of punning; but once attempting to play off a joke upon a gentleman named *Sparrowhawk*, he met with a retort in his own file. "What is the difference, said the Dr, (who was very corpulent) between an *owl* and a *sparrowhawk*?" "It is, replied the other, *fuller* in the head, *fuller* in the body, and *fuller* all over."

(3.) * **FULLER.** *n. f.* [*fullo*, Latin.] One whose trade is to cleanse cloth.—

The clothiers have put off

The spinsters, carders, *fullers*, weavers. *Shak.*
—His raiment became shining, exceeding white as snow; so as no *fuller* on earth can whiten them. *Mark*, ix. 3.

(4.) **FULLER.** See **FULLING**.

FULLERBY, a village in Lincolnshire, NE. of Horncastle.

(1.) * **FULLER'S EARTH.** *n. f.* *Fuller's earth* is

a marl of a close texture, extremely soft and glutinous to the touch: when dry it is of a greenish brown colour, in all degrees, from very pale almost black, and generally has a greenish cast. The finest *fuller's earth* is dug in our own country. See *Hill's Materia Medica*.—The *fuller's earth* of our land very much exceeds any yet discovered abroad in goodness; which is one great reason why English surpass all other nations in the woollen manufacture. *Woodward on Fossils.*

(2.) **FULLER'S EARTH**, in natural history, a species of clay, of a greyish ash-coloured in all degrees, from very pale to almost black, and it has generally something of a greenish tinge. See **CLAY**, § I, 4. It is very hard and firm, of a compact texture, of a rough and somewhat uneven surface, that adheres slightly to the tongue, but is very soft to the touch, not staining the hands, and breaking easily between the fingers. It has a great hardness between the teeth, and melts in the mouth. Thrown into water, it makes a great ebullition or hissing; but swells gradually, and falls into a fine soft powder. It makes a green tinge with aquafortis. The greatest quantity, and the finest earth of this kind in the world is dug in the pits at Wavedon, near Woburn Bedfordshire. The strata in these pits lie from the surface to the depth of six feet, and are several layers of sand, all reddish, but lighter coloured than others. Under these is a thin stratum of a sand-stone, which they dig through, and then they find the *fuller's earth*. The upper stratum of this is about a foot thick, the workmen call it *cledge*, and throw it away as useless; being commonly fouled with the matter which covered it, and which it sinuates in a good way into it. After this they come to the fine *fuller's earth*, which lies 8 feet deep. This matter of this is divided into several layers, being commonly about a foot and a half thick, and one horizontal fissure and another. Of these several layers, the upper half, where the earth breaks itself, is tinged red; which seems to be owing to the running of the water upon it, and among the sands above; some of which are probably of a ferruginous nature, or have ferruginous matter among them. This reddish *fuller's earth* the workmen call *crop*; and between the *crop* and this there is a thin stratum of matter, less than an inch, which in taste, colour, and appearance, resembles the terra Japonica of the shops. The lower half of the strata of *fuller's earth* they call *waile earth*. This is untinged, and has the red colour of the other, and seems the proper for tilling. Under the *fuller's earth* is a stratum of white and coarse stone about 2 feet thick. They seldom dig through this, if they do, they find more strata of sand. This *fuller's earth* is of great use in scouring cloths, stuffs, and imbibing all the grease and oil used in preparing, dressing, &c. of the wool; for which reason it is made a contraband commodity, and is not exported under the penalty of 1s. for every weight. See **FULLING**.

(1.) * **FULLER'S THISTLE, or WEEB.** [*Lipfacus*.] A plant.

(2.) **FULLER'S THISTLE, or TEAZLE.** in some parts called **FULLER'S WEEB**, or **WEEB**. See **DIP**.

ERTON POINT, a cape on the W. coast of N. Lon. 61. 35. W. Lat. 17. 13. N.

FULLERY, *n. f.* [from *fuller*.] The place or trade of a fuller is exercised.

FULLERY. See **FULLING**.

FULL-EYED, *adj.* [*full* and *eye*.] Having large eyes.

FULL-FED, *adj.* [*full* and *fed*.] Sated; fat; —

is a partridge, plump, *full-fed* and fair, m'd this image of well-bodied air. *Pope*.

FULLING, *n. f.* the art or act of cleansing, and pressing cloths, stuffs, and stockings,

making them stronger, closer, and firmer: called **FULLING**.

Pliny (*lib. vii. cap. 56.*) assures us that *Nicias*, the son of *Hermus*, was the inventor of the art of fulling: and it appears

from a description, quoted by *Sir G. Wheeler*, in his travels through Greece, that this *Nicias* was

born in Greece in the time of the Romans. The art of fulling of cloths and other stuffs is performed

at a fulling-mill, thence called a **FULLING-MILL**, or *fulling mill*. These mills, excepting

what relates to the mill-stones and hopper, are the same with corn mills: and there are

others which serve indifferently for either use: the one for grinding corn, and the other for fulling

by the motion of a large wheel. Whence, in some places, the fullers are called *mill-grinders*

and *mill-millers*. The principal parts of the fulling-mill are, the wheel, with its trundle; which gives

motion to the tree or spindle, whose teeth connect it to the pestles or stampers, which are

raised and made to fall alternately, according to the teeth catch on or quit a kind of latch

in the middle of each pestle. The pestles and stampers are of wood; each trough having at least

three or four pestles, at the discretion of the fuller, according to the force of the stream of

water. In these troughs are laid the cloths, stuffs, &c. to be full'd: then, letting the cur-

rent fall on the wheel, the pestles are successively let fall thereon, and by their weight and

stamp and press the stuffs very strongly, thus become thickened and condensed. In

the course of the operation, they sometimes make use of fuller's earth, and sometimes

of soap. To prepare the stuffs to receive the impressions of the pestle, they are usually laid

first in fuller's earth and water; and, secondly, in soap dissolved in hot water. Soap alone

does not serve very well; but this is expensive: tho' fuller's earth, in the way of our dressing, is scarce

valuable thereto; but then it must be well cleared from stones and grittinesses, which are apt to

enter into the stuff. As to urine, it is certainly

judicial, and ought to be entirely discarded; much on account of its ill smell, as of its

stink and saltiness, which qualities are apt to render the stuffs dry and harsh.

FULLING OF CLOTHS AND WOOLLEN STUFFS WITH SOAP. The best method of fulling

is delivered by *M. Colinet*, in an *memoir* on that subject, supported by extracts, made by order of the *marquis de Lou-*

vois superintendant of the arts and manufactures of France. 1. The substance of it is as

follows:—A coloured cloth, of about 45 ells, is to be laid in the usual manner, in the trough of a fulling mill; without first soaking it in water, as is commonly practised in many places. To full this trough of cloth, 15 lb. of soap are required; one half of which is to be melted in two peals of river or spring water, made as hot as the hand can bear it. This solution is to be poured by little and little upon the cloth in proportion as it is laid in the trough: and thus it is to be full'd for at least two hours: after which it is to be taken out and stretched. This done, the cloth is immediately returned into the same trough, without any new soap, and there full'd two hours more. Then taking it out, they wring it well, to express all the grease and filth. After the second fulling, the remainder of the soap is dissolved as in the former, and cast 4 different times on the cloth; remembering to take out the cloth every two hours, to stretch it, and undo the palls and wrinkles it has acquired in the trough. When they perceive it sufficiently full'd, and brought to the quality and thickness required, they scour it for good in hot water, keeping it in the trough till it be quite clean. As to white cloths, as these full more easily and in less time than coloured ones, a third part of the soap may be spared.

(3.) **FULLING OF STOCKINGS, CAPS, &c.** should be performed somewhat differently; viz. either with the feet or the hands; or a kind of rack or wooden machine, either armed with teeth of the same matter, or else horses or bullock's teeth. The ingredients made use of herein are, urine, green soap, white soap, and fuller's earth. But the urine is also reckoned prejudicial here. Woven stockings, &c. should be full'd with soap alone: for those that are knit, earth may be used with the soap. Indeed it is common to full these kinds of works with the mill, after the usual manner of cloth, &c. But that is too coarse and violent a method, and apt to damage the work, unless it be very strong.

(1.) * **FULLINGMILL**, *n. f.* [*full* and *mill*.] A mill where the water raises hammers which beat the cloth till it be cleansed.—By large hammers, like those used for paper and *fullingmills*, they beat their bar p. *Apertures*.

(2.) **FULLINGMILL**. See **FULLING**, § 1.

FULLINGTON, a village in Hampshire, near Bullington.

* **FULL-LADEN**, *adj.* [*full* and *laden*.] Laden 'till there can be no more added.—It were unfit that so excellent a reward as the Gospel promises should stoop down, like fruit upon a *full-laden* bough, to be plucked by every idle and wanton hand. *Tillotson*.

FULLIO, Peter, an heretical bishop of Antioch, in the 5th century, who embraced the Eutychian heresy, to which he added a singular notion of his own, that all the persons in the Trinity suffered on the cross; whence his followers were stiled **THEOPASCHATITES**. He usurped the see of Antioch from *Martyrius* in 471, for which he was afterwards deposed, but the emperor *Zeno* restored him. He died in 486.

* **FULL-SPREAD**, *adj.* [*full* and *spread*.] Spread to the utmost extent.—

How easy 'tis, when destiny proves kind,
With

With full-spread sails to run before the wind;
But those that 'gainst stiff gales lavecreeing go,
Must be at once relolv'd and skilful too. *Dryd.*

* FULL SUMMED. *adj.* [*full* and *summed*.] Complete in all its parts.—The cedar stretched forth his branches, and the king of birds nested within his leaves, thick feathered, and with full-summed wings fattening his talons East and West; but now the eagle is become half naked. *Howell's Forest*.

FULL-SUTTON, a town W. of Wilton, Yorks.

* FULLY. *adv.* [from *full*.] 1. Without vacuity. 2. Completely; without lack; without more to be desired.—There are many graces for which we may not cease hourly to sue, graces which are in bestowing always, but never come to be fully had in this present life; and therefore, when all things here have an end, endless thanks must have their beginning, in a state which bringeth the full and final satisfaction of all such perpetual desires. *Hooker*.—He fully possessed the entire revelation he had received from God, and had thoroughly digested it. *Locke*.—
The goddess cry'd
It is enough, I'm fully satiate'd. *Add. Ovid.*

(1.) FULMAR, in ornithology, a species of PROCELLARIA.

(2.) FULMAR, in zoology. See MUSTELA.

* FULMINANT. *adj.* [*fulminant*, Fr. *fulminans*, Latin.] Thundering; making a noise like thunder.

(1.) * To FULMINATE. *v. a.* To throw out as an object of terror.—As excommunication is not greatly regarded here in England, as now fulminated; so this constitution is out of use among us in a great measure. *Ayliffe's Parergon*.

(2.) * To FULMINATE. *v. n.* [*fulmino*, Latin, *fulminer*, Fr.] 1. To thunder.—

I cannot fulminate nor tonitruate words,
To puzzle intellects; my ninth lap affords
No Lycophronian bulks. *Tho. Randolph.*

2. To make a loud noise or crack.—Whilst it was in fusion we cast into it a live coal, which presently kindled it, and made it boil and flash for a pretty while; after which we cast in another glowing coal, which made it fulminate atress. *Boyle*.—In damps one is called the suffocating, and the other the fulminating damp. *Woodward's Natural Hist.*

3. To issue ecclesiastical censures.

(1.) FULMINATING, *part. adj.* thundering, or making a noise resembling thunder.

(2.) FULMINATING GOLD, } See CHEMIS-

(3.) FULMINATING SILVER, } TRY, Index.

(1.) * FULMINATION. *n. f.* [*fulminatio*, Lat. *fulmination*, French, from *fulminate*.] 1. The act of thundering. 2. Denunciations of censure.—The fulminations from the Vatican were turned into ridicule. *Ayliffe's Parergon*.

(2.) FULMINATION, in chemistry. See CHEMISTRY, Index; DETONATION, and NITRE.

(3.) FULMINATION, in the Romish canon law, a sentence of a bishop, official, or other ecclesiastical, appointed by the pope, by which it is decreed that some bull sent from the pope shall be executed.

* FULMINATORY. *adj.* [*fulmineus*, Latin; from *fulminate*.] Thundering; striking horror.

FULNEK, a town of Moravia, in the circle of Prerau, 30 miles NW. of Freyburg.

* FULNESS. *n. f.* [from *full*.] 1. of being filled so as to have no part. Your heave-offering shall be reckoned of the wine press. *Numb. xviii. 27.*—I roar and the fulness thereof. *Deut.*—To sea I wished nothing more than safety, freedom. *King Charles.* 2. The state of being in any quality good or bad. 3. Com such as leaves nothing to be desired—joyments are so complete, I turn wisher tulations, and congratulating their full with their continuance. *South.* 4. Cos from the coalition of many parts.—Th forwards to London, receiving the ac and applauses of the people as he we indeed were true and unfeigned, as migl pear in the very demonstration and ful cry. *Bacon's Henry VII.* 5. Completeness from deficiency.—In thy presence of joy. *Psalms*—

He is the half part of a blessed mar
Left to be finished by such as she;
And she a fair divided excellence,
Whose fulness of perfection lies in his
6. Repletion; satiety—I need not instil habitual intemperance of rich tables, accidents and effects of fulness, pride wantonness and softness. *Taylor.* 7. Plent To laple in fulness

Is sorer than to lie for need; and fall
Is worse in kings than beggars. *St*
8. Struggling perturbation; swelling in
—A principal fruit of friendship is the charge of the fulness of the heart, which of all kinds do cause and induce. *Bacon*
9. Largeness; extent—There wanted of a plot, and variety of characters to it it ought; and perhaps something might added to the beauty of the style. *Dr.*
Force of sound, such as fills the ear;
This sort of pastoral derives almost its wh from a natural ease of thought and sm verse; whereas that of most other kind in the strength and fulness of both. *Pope*

* FULSOME. *adj.* [from *fulle*, Sax 1. Nauseous; offensive.—

He that brings fulsome objects to m
With nauseous images my fancy fills,
And all goes down like oxymel of squi
How half the youth of Europe are
How fulsome must it be to stay behind
And die of rank diseases here at home
2. Rank; gross: to the smell.—White of a dainty smell, if the plant puts fo flowers only, and those not thin or dry commonly of rank and fulsome smell. 1 Lussful.—

He stuck them up before the fulsom

4. Tending to obscenity.—A certain which is ascribed to the emperor, is mc than any passage I have met with in *Dryden*.

* FULSOMELY. *adv.* [from *fulsom* ously; rankly; obscenely.

* FULSOMENESS. *n. f.* [from *fu* Nauseousness. 1. Rank smell. 3. —No decency is considered, no fulsomen

recom is wanting, as far as dulness can
Dryden.

FUMADO. *n. f.* [*fumus*, Latin.] A smoked
h that serve for the hotter countries, they
rst to fume, by hanging them upon long
e by one, drying them with the smoke
nd continual fire, from which they pur-
e name of *fumadoes*. *Carew.*

FUMAGE. *n. f.* [from *fumus*, Latin.]
oney. *Diß.*

FUMARIA, FUMITORY, a genus of the pen-
der, belonging to the diadelphia class of
id in the natural method ranking under
rder, *Corydalis*. The calyx is diphyllous ;
a ringent ; and there are two membran-
ments, each of which has three antheræ.
many different species, all low, shrubby,
s and evergreen plants, growing from 2
7 feet high, adorned with small simple
nd papilionaceous flowers of different

The most remarkable is the
FUMARIA OFFICINALIS, or common fumitory.
naturally in shady cultivated grounds,
luces spikes of purplish flowers in May
. It is very juicy, of a bitter taste, with-
remarkable smell. Its medical effects are,
hen the tone of the bowels, gently loosen
, and promote the natural secretions. It
recommended in melancholic, scorbutic,
neous disorders, for opening obstructions
iscera, attenuating, and promoting the
m of viscid juices. Hoffman had a great
f it as a purifier of the blood ; and assures
in this intention scarce any plant exceeds
s and sheep eat it ; goats are not fond of
s and swine refuse it.

FUMATORY. *n. f.* [*fumaria*, Lat. *fume-*
| An herb.—

Her fallow leas
amel, hemlock, and rank *fumatory*,
oot upon. *Shakespeare's Henry V.*
LY, a town of France, in the dep. of
1. Its chief trade is in slates.

TO FUMBLE. *v. a.* To manage auk-

many farewells as be stars in heav'n,
listinct breath and consign'd kisses to them,
bles up all in one loose adieu. *Shak.*

His greasy bald pate choir
fumbling o'er the beads, in such an agony
told 'em false for fear. *Dryd. Sp. Fryar.*

TO FUMBLE. *v. n.* [*fommelen*, Dutch.]
tempt any thing awkwardly or ungainly.
mechanick theists will have their atoms
e to have *fumbled* in these their motions,
ve produced any inept system. *Cudworth.*
uzzle ; to strain in perplexity.—Am not
I to help you out ? You would have been
half an hour for this excuse. *Dryden's*
Fryar.

3. To play childishly.—I saw him
ith the sheets, and play with flowers, and
on his finger's end. *Shak. Henry V.*

FUMBLER. *n. f.* [from *fumble*.] One who
wardly.

FUMBLINGLY. *adv.* [from *fumble*.] In an
manner.

FUMÉE. *n. f.* [*fumée*, French ; *fumus*, Latin.]
e.—

Thus fighting fires a while themselves con-
sume ;

But streight, like Turks, forc'd on to win or die,
They first lay tender bridges of their *fume*,
And o'er the breach in unctuous vapours fly.

Dryden.

2. Vapour ; any volatile parts flying away.—

Love is a smoke rais'd with the *fume* of sighs ;
Being purg'd, a fire sparkling in lovers eyes. *Sb.*
—It were good to try the taking of *fumes* by pipes,
as they do in tobacco, of other things, to dry and
comfort. *Bacon.*—In Winter, when the heat with-
out is less, breath becomes so far condensed as to
be visible, flowing out of the mouth in form of a
fume, or crasser vapour ; and may, by proper
vessels, set in a strong freezing mixture, be collec-
ted in a considerable quantity. *Woodw. Nat. Hist.*

3. Exhalation from the stomach.—The *fumes* of
drink discompose and stupify the brains of a man
overcharged with it. *South.*—

Plunged in sloth we lie, and snore supine,
As fill'd with *fumes* of undigested wine. *Perf.*
Pow'r, like new wine, does your weak brain
surprize,

And its mad *fumes* in your discourses rise ;
But time these yielding vapours will remove :
Mean while I'll taste the sober joys of love.

Dryden's Aurengzebe.

4. Rage ; heat of mind ; passion.—The *fumes* of
his passion do really intoxicate and confound his
judging and discerning faculty. *South.* 5. Any
thing unsubstantial.—

When Duncan is asleep, his two chamberlains
Will I with wine and wassail so convince,
That memory, the warder of the brain,
Shall be a *fume*. *Shakespeare's Macbeth.*

6. Idle conceit ; vain imagination.—Plato's great
year would have some effect, not in renewing the
state of like individuals ; for that is the *fume* of
those, that conceive the celestial bodies have more
accurate influence upon these things below, than
they have, but in gross. *Bacon.*—To lay aside all
that may seem to have a show of *fumes* and fancies,
and to speak solids, a war with Spain is a mighty
work. *Bacon.*

(1.) **TO FUME.** *v. a.* 1. To smoke ; to dry in
the smoke.—Those that serve for hot countries
they used at first to *fume*, by hanging them upon
long sticks one by one, and drying them with the
smoke of a soft fire. 2. To perfume with odours
in the fire.—

She *fum'd* the temples with an od'rous flame,
And oft before the sacred altars came,

To pray for him who was an empty name. *Dryd.*

—The *fuming* of the holes with brimstone, garlick,
or other unfavory things, will drive moles out of
the ground. *Mortim.* 3. To disperse in vapours.
—The heat will *fume* away most of the scent. *Mort.*

(2.) * **TO FUME.** *v. n.* [*fumer*, French ; *fumo*,
Latin] 1. To smoke.—

Their prayers pass'd
Dimensionless through heav'nly doors ; then clad
With incense, where the golden altar *fum'd*
By their great intercessor ; came in sight
Before the Father's throne. *Milton's Par. Lost.*
From thence the *fuming* trail began to spread,
And lambent glories danc'd about her head.

Dryden's Æn.
e.

Strait hover round the fair her airy band ;
Some, as she sipp'd, the *fuming* liquor fann'd.

Pope.

2. To vapour ; to yield exhalations, as by heat.
Tie up the libertine in a field of feasts,
Keep his brain *fuming*. *Shak. Ant. and Cleop.*
Silenus lay,
Whose constant cups lay *fuming* to his brain,
And always boil in each extended vein. *Rosc.*

3. To pass away in vapours.—

We have

No anger in our eyes, no storm, no lightning ;
Our hate is spent and *fum'd* away in vapour,
Before our hands be at work. *B. Jonson's Cat.*
—Their parts are kept from *fuming* away by their
fixity, and also by the vast weight and density of
the atmospheres incumbent upon them. *Cheyne's*
Phil. Princ.—

The first fresh dawn then wak'd the gladden'd
race

Of uncorrupted man, nor blush'd to see
The sluggard sleep beneath its sacred beam ;
For their light slumbers gentle *fum'd* away.
Thomson's Spring.

4. To be in a rage ; to be hot with anger.—

When he knew his rival free'd and gone,
He swells with wrath ; he makes outrageous
moan :
He frets, he *fumes*, he stares, he stamps the
ground,
The hollow tow'r with clamours rings around.
Dryden.

FUMEL, a town of France, in the dep. of Lot
and Garonne, 9 miles N. of Tournon.

* FUMET. *n. f.* The dung of the deer.

* FUMETTE. *n. f.* [French.] A word intro-
duced by cooks, and the pupils of cooks, for the
stink of meat.—

A haunch of ven'son made her sweat,
Unless it had the right *fumette*. *Swift.*

* FUMID. *adj.* [*fumidus*, Latin.] Smoky ;
vaporous.—A crafts and *fumid* exhalation is caused
from the combat of the sulphur and iron with the
acid and nitrous spirits of *aquafortis*. *Brown's*
Vulg. Err.

* FUMIDITY. *n. f.* [from *fumid*.] Smokiness ;
tendency to smoke.

* To FUMIGATE. *v. n.* [from *fumus*, Latin ;
fumiger, Fr.] 1. To smoke ; to perfume by smoke
or vapour.—

Wouldst thou preserve thy fami'h'd family,
With fragrant thyme the city *fumigate*,
And break the waxen walls to save the state.
Dryden's Virgil.

2. To mediate or heal by vapours.

* (1.) FUMIGATION. *n. f.* [*fumigatio*, Latin ;
fumigation, French ; from *fumigatus*.] 1. Scents
raised by fire. — *Fumigations*, often repeated, are
very beneficial. *Arbuthnot.*—

My *fumigation* is to Venus, just
The fumes of roses, and red cedar's dust :
And, last, to make my *fumigation* good,
'Tis mixt with sparrows brains and pigeons
blood. *Dryden.*

2. The application of medicines to the body in
fumes.

* (2.) FUMIGATION, in chemistry, a kind of cal-
cination, when metals or other hard bodies are

corroded or softened by receiving ce
for that purpose.

(3.) FUMIGATION, in medicine.
The fumes produced by burning certain
much benefit or prejudice may be pr

FUNCTION. n. f. [*functio*, Lat.] 1. Discharge or performance.—There is hardly a greater difference between two things than there is between representing commoner in the *function* of each calling, and the same person in common life. 2. Employment; office.—The minister is now bound to any one tribe: now none is bound from that *function* of any degree, state, or office. *Whitgift*.—You have paid the heavens their *function*, and the prisoner the very debt of his *function*. *Shak*.—Nor was it any policy, or object of partiality of affection either to the men or the *function*, which fixed me. *King Charles*.—The *function* of the goddess gives a complexion of light and beauty to the ode which Horace addressed to her. *Addison on Italy*.—Let not ignominies discourage us from asserting the majesty and pre-eminence of our holy *function*. *Atterbury*. 3. Single act of any kind. Without difference those *functions* cannot, but they must, be executed. *Hooker*.—They have offered up prayers against fire, tempests, and misery for the dead, in which *functions* they adorned garments. *Stillington*. 4. Trade; office.—Follow your *function*; go, and but old bits. *Shak*. 5. Office of any particular part of the body.—The bodies of men and animals, are excellently well fitted for life and labour; and the several parts of them well adapted to their particular *functions*. *Bentley*. 6. Faculty: either animal or intellectual.—He is in his eyes, distraction in his aspect, broken voice, and his whole *functions* suiting forms to his conceit. *Shak. Hamlet*.

Nature seems
her *functions* weary of herself:
The race of glory run, and race of shame;
I shall shortly be with them that rest. *Milt*.
Whatever warms the heart, or fills the head,
The mind opens, and its *functions* spread,
The nation plies her dang'rous art,
And pours it all upon the peccant part. *Pope*.
In every human constitution is morbid,
Their diseases consistent with the common
of life. *Arbutnot*.

FUNCTION, in the animal œconomy, (§ 1, &c.) by physicians divided into vital, animal, and natural.

FUNCTIONS, ANIMAL, include the senses, judgment, and voluntary motions; without all of which an animal may live but not comfortably. The animal functions perform the motion of the body by the action of the

X. PART I.

muscles; and this action consists chiefly in the shortening the fleshy fibres, which is called *contraction*, the principal agents of which are the arteries and nerves distributed in the fleshy fibres. All parts of the body have their own functions, or actions, peculiar to themselves. Life consists in the exercise of these functions, and health in the free and ready exercise of them.

2. **FUNCTIONS, NATURAL**, are such as it cannot subsist any considerable time without; as the digestion of the aliment, and its conversion into blood.

3. **FUNCTIONS, VITAL**, are those necessary to life, and without which the individual cannot subsist; as the motion of the heart, lungs, &c.

(1) * **FUND. n. f.** [*fund*, Fr. *funda*, a bag, Lat.] 1. Stock; capital; that by which any expence is supported.—He touches the passions more delicately than Ovid, and performs all this out of his own *fund*, without diving into the arts and sciences for a supply. *Dryden*.—

Part must be left, a *fund* when foes invade,
And part employ'd to roll the wat'ry tide. *Dryden*.
—In preaching, no men succeed better than those who trust entirely to the stock or *fund* of their own reason, advanced indeed, but not overlaid by commerce with books. *Swift*. 2. Stock or bank of money.—As my estate has been hitherto either lost upon seas, or fluctuating in *funds*, it is now fixed in substantial acres. *Addison*.

(2.) **FUND, SINKING**, that part of the national revenue, which is set aside for the payment of the NATIONAL DEBT.

(3.) **The FUNDS**, those large sums which have been lent to government, and constitute the national debt; and for which the lenders, or their assignees, receive interest from revenues allotted for that purpose. The term stock is used in the same sense, and is also applied to the sums which form the capital of the bank of England, the East India and South Sea companies; the proprietors of which are entitled to a share of the profits of the respective companies. The practice of funding was introduced by the Venetians and Genoese in the 16th century, and has been adopted since by most of the nations in Europe. Princes had often borrowed money, in former times, to supply their exigencies, and sometimes mortgaged their territories in security: but these loans were generally extorted, and their payment was always precarious; for it depended on the good faith and success of the borrower, and never became a regular burden on posterity. The origin of funds is derived from the peculiar manners and circumstances of modern Europe. Since the invention of gunpowder, and the progress of commerce, the military occupation has become a distinct employment in the hands of mercenaries; the apparatus of war is attended with more expence; and the decision of national quarrels has often been determined by command of money rather than by national bravery. Ambitious princes have therefore borrowed money, to carry on their projects with more vigour. Weaker states have been compelled, in self-defence, to apply to the same resource; the wealth introduced by commerce has afforded the means; the regularity of administration, established in consequence of the progress of civiliza-

tion, has increased the confidence of individuals in the public security; the complicated system of modern policy has extended the scenes of war, and prolonged their duration; and the colonies established by the mercantile nations have rendered them vulnerable in more points, and increased the expence of defending them. When a greater sum has been required for the annual expence, than could easily be supplied by annual taxes, the government have proposed terms, to their own subjects, or foreigners, for obtaining an advance of money, by mortgaging the revenue of future years for their indemnification. This mortgage may either be for a limited period, or perpetual. If the sum allotted annually for the benefit of those who advance the money, be considerably greater than the interests of the sums advanced, they may agree to accept of such allowance, for a limited time, as a full equivalent. Thus, they may either agree for the casual produce of the revenue assigned; or a fixed annuity for a greater or less number of years; or a life annuity to themselves or nominees; or an annuity for two or more lives; or an annuity, with the benefit of survivorship, called a *jointure*, in which scheme, the whole sum to which the original annuitants were intitled continues to be distributed among the survivors. The establishment of the funds was introduced in Britain at the Revolution; and has since been gradually enlarged, and carried to an amazing extent. The various methods above-mentioned have been used in their turns, but perpetual annuities have been granted for the greatest part: and, even when the money was originally advanced on other conditions, the lenders have been sometimes induced, by subsequent offers, to accept of perpetual annuities, instead of the former terms. The debt, for which perpetual annuities are granted, is called the *redeemable debt*, and the other is called the *irredeemable debt*. Although the debts thus contracted by government are seldom paid for a long term of years; yet any creditor of the public may obtain money for what is due him when he pleases, by transferring his property in the funds to another; and regular methods are appointed for transacting these transfers in an easy manner. By these means, the stocks become a kind of circulating capital: they have the same effect, in some respects, as the circulating money in the nation. When a stockholder transfers his share, he may sometimes be able to obtain a greater price than the original value, and at other times be obliged to accept of a less one. The value of the funds depends on the proportion between the interest they bear, and the benefit which may be obtained by applying the money to other purposes. It is influenced by the plenty or scarcity of money, and by the greatness or smallness of the public debt; and it is impaired by any event which threatens the safety, or weakens the credit, of the government. The business of STOCK JOBBING is founded on the variation of the prices of stock. Persons possessed of real property may buy or sell stock, according to their notion that the value is likely to rise or fall, in expectation of making profit by the difference of price. And a practice has taken place among persons who often possess no property in the funds, to contract for the sale of

stock against a future day, at a price on. For instance: A agrees to sell bank stock, to be transferred, in 20 days. A has, in fact, no such stock; but, if bank stock, on the day appointed for should be only 118 per cent, A may much as will enable him to fulfil his contract for 120 per cent, and thus he gains 20 per cent. on the contrary, if the price of bank stock, on the day appointed, be 120 per cent, he will lose 20 per cent. The business is settled without any actual purchase or sale of stock, by A paying to B, or receiving from B, the difference between the current price of stock, on the day appointed, and the price by which A contracted to sell. This practice, which is really nothing more than a bet concerning the price of stock, is carried on to a great extent in the Exchange-alley, where many kinds of business are transacted, the buyer is called the *bull*, and the seller a *bear*. As neither party is compelled by law to implement these bargains, the sense of honour, and the disgrace attending a breach of the principles by which the business is conducted, are the only motives. When a person declines to pay his loan, he is called a *lame duck*, and dare never afterwards appear in the Alley. This opprobrious appellation, however, is not bestowed on those who are unable, owing to want of ability, providing the same surrender of their property voluntarily as the law would have exacted if the debt was entitled to its sanction. The interest on the stock is paid half-yearly; and the lender has the benefit of the interest due on his loan, from the last term to the time when the next term falls due. Therefore the prices of the stocks rise or fall, *ceteris paribus*, from term to term, according to the term when the interest is paid. In comparing the prices of the different stocks, it is necessary to convert them to the term when the last interest was paid, and allowance being made for this, the prices of all the government stocks, which bear interest at the same rate, must be the same, as they all depend on the same principle. When a loan is proposed, such terms are offered to the lenders, as may render the loan beneficial: and this is now regulated by the prices of the old stocks. If the stocks bear interest at 4 per cent, sell at par, or above par, the government may expect to borrow at that rate; but, if these stocks are under par, the government must either grant a higher interest, or some other advantage to the lenders, to compensate for the difference. For this purpose, besides the perpetual annuity, another annuity has sometimes been granted for life, or for a certain number of years. Lotteries have frequently been used to facilitate the loan, by entitling the lender to a certain number of tickets, for which a small price is charged than the exact value of the prizes, though their market price is sometimes 20 or 30 per cent higher. Sometimes an abatement of a certain proportion of the capital has been granted, and a lender entitled to hold 1000 l. in reality he advanced no more perhaps. It belongs to the Chancellor of the Exchequer to propose the terms of the loan in parliament, and he generally makes a previous agree-

althy merchant, who are willing to ad-
 ce money on the terms proposed. The
 ers to the loan deposite a certain part of
 subscribed; and are bound to pay the rest
 ments, or stated proportions, on appoint-
 , under pain of forfeiting what they have
 d. For this they are entitled, perhaps, not
 hold their share in the capital, but to an
 for 10 years, and to the right of receiving
 a number of lottery tickets on advantage.
 na. They may sell their capital to one
 their annuity to a second, and their right
 ckets to a third. The value of all these in-
 ogether is called *annuity*; and, in order to
 ready subscription, it ought to amount
 or upwards, on 100l. of capital. This
 is called the *bonus* to the subscribers.
 ital advanced to the public, in the form
 scorable stocks, and bearing interest from
 propriated for that purpose, is called the
lot. Besides, there is generally a con-
 sum due by government, which is not dif-
 in that manner, and therefore is distin-
 by the appellation of the *unfunded debt*.
 y arise from any sort of national expence,
 ch no provision has been made, or for
 e provision has proved insufficient. The
 nches are, 1. EXCHEQUER BILLS. These
 d from the exchequer, generally by ap-
 nt of parliament, and sometimes without
 ointment, when exigencies require. They
 rest from the time when issued, and are
 by the bank of England, which promotes
 mation. See EXCHEQUER, § 4. 2. NAVY
 The sums annually granted for the navy
 ays fallen short of what that service re-
 To supply that deficiency, the admiralty
 is in payment of victuals, stores, and the
 ch bear interest six months after the time
 The debt of the navy thus contracted is
 d, from time to time, by parliament. In
 war, the public expences, since the revo-
 ave always been much greater than the
 venue; and large sums have consequent-
 borrowed. In time of peace, the revenue
 the expence, and part of the public debts
 uently been paid off. But, though there
 u more years of peace than of war since
 s were established, the debts contracted
 ach war have much exceeded the pay-
 ing the subsequent peace. This will
 the following abstract of the progress of
 nal debt.

peace of Ryswick, 1697	L. 21,515,472
the beginning of war, 1701	16,394,701
debted during peace, 1697 to	5,121,071
the peace of Utrecht 1714,	
ing value of annuities af-	
ds subscribed to South Sea	
	55,282,978
ed during war 1701 to 1714	38,888,277
beginning of war 1740, in-	
g L. 1,000,000 charged on	
	47,954,623
ed during peace 1714 to	7,328,355

Debt at the peace of Aix-la-Chapelle,
 1748

Contracted during war 1740 to 1748	L. 99,193,313
Debt at beginning of war 1756	31,238,690
Paid off during peace 1748 to 1756	73,289,673
Debt funded at the peace 1763, in-	5,903,649

cluding L. 9,839,597 then owing,
 which was funded in the subse-
 quent years 133,957,270

Besides this, about L. 6,000,000 of
 of debt was paid off, without ever
 being funded.

Funded debt, 1775 125,000,000

Paid off during peace 1763 to 1775,
 besides the above unfunded debt 8,959,270

Funded debt at the peace 1783 211,363,254

The unfortunate and destructive war, now carry-
 ing on against the French Republic, has added
 most enormously to the public debt. Some even
 suppose it has increased it by a sum of above two
 hundred millions.

(1.) * FUNDAMENT. *n. f.* [*fundamentum*,
 Latin.] The back part of the body.

(2.) FUNDAMENT, in anatomy, the lowest part
 of the intestinum rectum, called by anatomists the
 ANUS. See ANATOMY, *Index*.

(1.) * FUNDAMENTAL. *adj.* [*fundamentalis*,
 Lat. from *fundament*.] Serving for the foundation;
 that upon which the rest is built; essential; im-
 portant; not merely accidental.—Until this can
 be agreed upon, one main and *fundamental* cause
 of the most grievous war is not like to be taken
 from the earth. *Raleigh's Essays*.—

You that will be less fearful than discreet,
 That love the *fundamental* part of state,
 More than you doubt the charge of't. *Sh. Cor*
 —Others, when they were brought to allow the
 throne vacant, thought the succession should go
 to the next heir, according to the *fundamental*
 laws of the kingdom, as if the last king were ac-
 tually dead. *Swift*.—Gain some general and *fun-*
damental truths, both in philosophy, in religion,
 and in human life. *Watts*.—

Such we find they are, as can controul
 The servile actions of our wav'ring soul,
 Can fright, can alter, or can chain the will;
 Their ills all built on life, that *fundamental* ill.

Prior.

Yet some there were among the sounder few,
 Of those who less presum'd, and better knew,
 Who durst assert the juster ancient cause,
 And here restor'd wit's *fundamental* laws. *Pope*,

(2.) * FUNDAMENTAL. *n. f.* Leading proposi-
 tion; important and essential part which is the
 groundwork of the rest.—We propose the ques-
 tion, whether those who hold the *fundamentals* of
 faith may deny Christ, and be damnable in respect
 of superstructures and consequences that arise from
 them. *South*.—It is a very just reproach, that there
 should be so much violence and hatred in re-
 ligious matters, among men who agree in all *fun-*
damentals, and only differ in some ceremonics, or
 mere speculative points. *Swift*.

(3.) FUNDAMENTAL BASS, in music, that which
 serves for a foundation to the harmony. This
 part is according to Rousseau, and all authors
 who have proceeded upon M. Rameau's experi-

ment, in its primary idea, that bass which is formed by the fundamental notes of every perfect chord that constitutes the harmony of the piece; so that under each chord it causes to be heard, or understood, the fundamental sound of that particular chord; that is, the sound from whence it is derived by the rules of harmony. From whence we may see, that the fundamental bass can have no other contexture than that of a regular and fundamental succession, without which the procedure of the upper parts would be illegitimate. To understand this well, it is necessary to be known, that, according to the system of Rameau, which Rousseau has followed in his dictionary, every chord, though composed of several sounds, can only have one which is its fundamental, viz. that which produces this chord, and which is its bass according to the direct and natural order. (See § 4, 5.) Now, the bass which prevails under all the other parts, does not always express the fundamental sounds of the chords: for amongst all the sounds which form a chord, the composer is at liberty to transfer to the bass that which he thinks preferable; regard being had to the procedure of that bass, to the beauty of the melody, and above all to the expression, as afterwards explained. In this case the real fundamental sound, instead of retaining its natural station, which is in the bass, will either be transferred to some of the other parts, or perhaps even entirely suppressed, and such a chord is called an *inverted* chord. In reality, says Rameau, a chord inverted does not differ from the chord in its direct and natural order from which it was produced: but as these sounds form different combinations, these combinations have long been taken for fundamental chords; different names have been given them, which may be seen at the word ACCORD, in *Rousseau's Dictionary*. These names, by the persons who bestowed them, were thought to create and sanctify their distinctions; as if a difference in names could really produce a difference in the species. M. Rameau in his *Treatise of Harmony* has shown, and M. d'Alembert in his *Elements of Music* has still more clearly evinced, that many of these pretendedly different chords were no more than inversions of one single chord. Thus the chord of the 6th is no more than the perfect chord of the 3d transferred to the bass; by adding a 5th, we shall have the chord of the 6th and 4th. Here there are three combinations of a chord, which only consists of 3 sounds; those which contain 4 sounds are susceptible of 4 combinations, since each of these sounds may be transferred to the bass. But in adding beneath this another bass, which, under all the combinations of one and the same chord, always presents the fundamental sound; it is evident, that consonant chords are reduced to the number 3, and the number of dissonant chords to 4. Add to this all the chords by supposition, which may likewise be reduced to the same fundamentals, and you will find harmony brought to a degree of simplicity, in which no person could ever hope to see it, whilst its rules remained in that state of confusion where M. Rameau found them. It is certainly, as that author observes, an astonishing occurrence, that the practice of this art could be carried so

far as it really was, without knowing the reason; and that all the rules were so exact without having discovered the principles they depended. After having shewn the fundamental bass beneath the chords, now treat of its procedure, and of the way in which it connects these chords among. Upon this point the precepts of the 1st are reduced to the six following rules. 1. The fundamental bass ought never to sound notes, than those of the series or tone in which the composer finds himself, or at least those series or tone to which he chooses to maintain. This of all the rules for the fundamental bass is the first and most indispensable. 2d, its procedure ought to be so imbricated to the laws of modulation, as never to suffer the idea of a former mode to be lost, or of a subsequent one can be legitimately introduced: that is to say, that the fundamental bass never to be devious, or suffer us to be ignorant of the mode at a loss in what mode we are. 3d, it is subjected to the connection and the preparation of dissonances: a connection which, as we shall afterwards see, is not but a method of producing this connection which of consequence is only necessary. 4. By the 4th it is necessary to prepare every dissonance, to pursue that career of resolution of the dissonance indispen- scribes. See RESOLUTION. 5. By the 5th it is nothing else but a consequence of the fundamental bass ought only to move by consonant intervals; except alone in the case of a broken cadence, or after a chord of diminished, where it rises diatonically. 6. The motion of the fundamental bass is illegitimate. By the 6th, in short, the fundamental bass ought not to be syncopated; but to distinguish the bars and the times which they mark by changes of chords properly marked. 7. In such a manner, for instance, dissonances which ought to be prepared, their preparation in the imperfect time, so that all the repeses may happen in the same time. This sixth rule admits of an infinite number of exceptions; but the composer must ever to be attentive to it, if he would succeed in which the movements are proper and in which the bars may end gracefully. 8. Whenever these rules are observed, the harmony is regular and without fault: this, however, does not hinder the music from being detestable. POSITION, § 7. An illustration of the 5th rule may be useful. Whatever turn may be given to the fundamental bass, if it is properly formed, these alternatives must always be found in perfect chords moving by consonant intervals without which their efforts would have no effect; or, dissonant chords in operation: in every other case, the dissonance neither be properly placed nor properly prepared. Hence it follows, that the fundamental bass must not move regularly but in one of these three ways. 1st, To rise or descend by a 3d or a 4th. 2d, By a 4th or a 5th. 3dly, To rise diatonically by means of the dissonance which forms it.

by a licence upon a perfect chord. With to a diatonic descent, it is a motion absolutely prohibited to the fundamental bass; or, at least, severely tolerated in cases where two perfect are in succession, divided by a close expression understood. This rule has no other exception, it is from not discerning the foundation in transitions, that M. Rameau has caused fundamental bass to descend diatonically upwards of the 7th; an operation which is impossible in legitimate harmony. See **CADENCE**, § III, and **DISCORD**, § 2. The fundamental bass, which they add for no other reason, serve as a proof of the harmony, must be heeded in execution, and often in practice it have a very bad effect; for it is, as M. Rameau properly observes, intended for the eye, and not for the ear. It would at once produce a monotony extremely nauseous by its returns of the same chord, which they avoid and vary more agreeably, by combining it in different manners upon the continued bass, and reckoning upon the different inversions of the chord, which furnish a thousand means of new beauties to the music and new energy of expression. See **CHORD**, § II; and **INVERSION**.

But it may be objected, If the fundamental bass is not useful in composing good music, if it even be retrenched in practice, what good can it then, can it serve? We answer, that, in its place, it serves for a rule to scholars, upon which they may learn to form a regular harmony, and to give to all the parts such a diatonic movement; procedure as is prescribed them in the fundamental bass. 2dly, It proves whether harmony already formed be just and regular; harmony which cannot be subjected to the fundamental bass, must according to all be bad. 3dly, It serves for the investigation of continued bass under a given air; though, in it, he who cannot directly form a continued bass will scarcely be able to form a fundamental which is better; and much less still will he be able to transform that fundamental bass into a new continued bass. These which follow, however, the principal rules which M. Rameau prescribes for finding the fundamental bass under an air. 1. To ascertain with precision the point at which the composer begins, and those points at which he passes. There are also rules respecting the modes; but so long, so vague, and incomplete, that with respect to this, the ear is formed long before the rules are acquired; he dances who should try to use them without improvement, but the habit of proceeding always note by note, without even knowing what he is. 2. To try in succession, under each of the principal chords of the mode, beginning those which are most analogous, and passing to the most remote, when the composer feels it under a necessity of doing so. 3. To consider whether the chord chosen can suit the upper part in what precedes and in what follows, by a natural succession: and when this is impossible, to return the way he came. 4. Not to change the note of the fundamental bass till having exhausted all the notes which are allowed in succession in the upper part, and which can

enter into its chord; or till some syncopated note in the air may be susceptible of two or a greater number of notes in the bass, to prepare the dissonance which may be afterwards resolved according to rule. 5. To study the intertexture of the phrases; the possible succession of cadences, whether full or avoided; and above all, the pauses which for ordinary return at the end of every 4, or of every 2 bars, so that they may always fall upon perfect and regular cadences. 6. To observe all the rules formerly given for the composition of the fundamental bass.—These are the principal observations to be made for finding one under any given air; for there are sometimes several different ones which may be investigated. But, whatever may be said to the contrary, if the air has accent and character, there is only one just fundamental bass which can be adapted to it. After having given a summary explication of the manner in which a fundamental bass should be composed, it should remain to suggest the means of transforming it into a continued bass; and this would be easy, if it were only necessary to regard the diatonic procedure and the agreeable air of this bass. But let us not imagine that the bass, which is the guide and support of the harmony, the soul, and as it were the interpreter of the air, should be limited to rules so simple: there are others which depend upon principles more certain and radical; fruitful, but latent principles, which have been felt by every artist of genius, without having been detected by any one. Rousseau hopes, that, in his letter upon French music, he has insinuated this principle. For those who understand him, he imagines he has said enough concerning it, and can never say enough of it for those who do not. See *Rousseau's Miscellaneous*, Vol. II. p. 1. He does not here mention the ingenious system by M. Serre of Geneva, nor his double fundamental bass; because the principles, which, with a sagacity meritorious of praise, he had half detected, have afterwards been unfolded by M. Tartini, in a work of which Rousseau has given an account in his article **SYSTEM**.

(4.) A **FUNDAMENTAL CHORD**, is that whose bass is fundamental, and in which the sounds are ranged in the same order as when they are generated, according to the experiment so often repeated by M. d'Alembert, in his Preliminary Discourse and Element of Music. See **MUSIC**. But as this order removes the parts to an extreme distance one from the other, they must be approximated by combinations or inversions; but if the bass remains the same, the chord does not for this reason cease to bear the name of *fundamental*. Such an example is this chord, *ut mi sol*, included in the interval of a fifth: whereas, in the order of its generation, *ut sol mi*, it includes a tenth, and even a seventeenth; since the fundamental *ut* is not the fifth of *sol*, but the octave of that fifth.

(5.) A **FUNDAMENTAL SOUND** is that which forms the lowest note of the **CHORD**, and from whence are deduced the harmonical relations of the rest; or, which serves for a key to the tone. See **TONIC**.

* **FUNDAMENTALLY**. *adv.* [from *fundamental*.] Essentially; originally.—As virtue is seated *fundamentally* in the intellect, so perspective is in

in the fancy; so that virtue is the force of reason, in the conduct of our actions and passions to a good end. *Grew*.—Religion is not only useful to civil society, but *fundamentally* necessary to its very birth and constitution. *Bentley*.—The unlimited power placed *fundamentally* in the body of a people, the legislators endeavour to deposit in such hands as would preserve the people. *Swift*.

FUNDAON, a town of Portugal, in the prov. of Beira; 22 miles W. of Alfayates.

FUNDI, in ancient geography, a town of Latium, on the Via Appia, near Cajeta; enjoying all the privileges of Roman citizens, except the right of suffrage and of magistracy; now called FONDI.

FUNDO, a town of European Turkey, in Moldavia, 44 miles WNW. of Birlat.

FUNDY, a bay of N. America, between New England and Nova Scotia, remarkable for its tides, which rise to the height of 50 or 60 feet, and flow so rapidly as to overtake animals which feed upon the shore. It has a good fishery.

FUNEN, FIONIA, or FYEN, a considerable island of Denmark, in the Baltic sea, separated from Jutland by a strait called the *Lesser Belt*, and from the island of Zealand by the *Great Belt*. It is 340 miles in circuit; is fertile in wheat and barley, and abounds in grain cattle, horses, game, and fish. Odensee is the capital. Lon. from 9. 40. to 10. 50. E. Lat. 55. 7. to 55. 42. N.

(1.) * FUNERAL. *adj.* Used at the ceremony of interring the dead.—

Our instruments to melancholy bells,
Our wedding cheer to a sad funeral feast. *Shak.*
Let such honours
And funeral rites, as to his birth and virtues
Are due, be first perform'd. *Denham's Sophy.*
Thy hand o'er towns the fun'ral torch displays,
And forms a thousand ills ten thousand ways.

Dryden.

(2.) * FUNERAL. *n. s.* [*funus*, Latin; *funerailles*, French.] 1. The solemnization of a burial; the payment of the last honours to the dead; obsequies—

Here, under leave of Brutus, and the rest,
Come I to speak in Cæsar's funeral. *Shak.*
All things that we ordained festival,
Turn from their office to black funeral. *Shak.*
—He that had cast out many unburied, had none to mourn for him, nor any solemn funerals, nor sepulchre with his fathers. 2 *Mac.* v. 10.—

No widow at his funeral shall weep. *Sandys.*
2. The pomp or procession with which the dead are carried.—

The long funerals blacken all the way. *Pope.*
—You are sometimes desirous to see a funeral pass by in the street. *Swift.* 3. Burial; interment.—

May he find his funeral
I' th' sands, when he before his day shall fall.

Denham.

(3.) FUNERAL GAMES, a part of the ceremony of the ancient funerals. It was customary for persons of quality, among the ancient Greeks and Romans, to institute games, with all sorts of exercises, to render the death of their friends more remarkable. This practice was general, and is often mentioned by ancient writers. Patroclus's

funeral games take up the greatest part of Homer's *Iliads*; and Agamemnon's games, introduced by the same poet, telling the Greeks, that he had been a spectator at a number of such solemnities. The celebrated games among the Greeks mostly consisted of races; the prizes were of different sort according to the quality and magnificence of the person that celebrated them. The games to victors on such occasions were usual, which was thought to have some relation to the dead. Those games, the Romans, consisted chiefly of processions, sometimes of mortal combats of gladiators, and sometimes of the funeral pile. They, as well as the Greeks, had also a custom, though very ancient, of sacrificing the throats of a number of captives to the pile, as victims to appease the manes of the deceased. Cæsar relates, that the Gauls used this custom. The funeral games were also instituted by the emperor Claudius.

(4.) FUNERAL ORATION, a discourse delivered in praise of a person deceased, at the time of his funeral. This custom is very ancient, and the annexed account of the Egyptian interment, (See § 6.) may be perceived to be the subject of them, which were afterwards adopted by the Romans, who adopted this custom. I omit remarking, that those funeral orations were attended not only with orations in praise of the deceased, but with prayers for him, and for one who personated the deceased. An example of one of these is preserved by Porphyry (says he) they (the Egyptians) embalmed the deceased nobles, they privately take out the heart, and lay them up in an ark or chest: among other things which they do for the deceased, lifting up the ark or chest, they invoke him; one of the Libyans, having a prayer for the deceased, which he has translated out of the Egyptian language is as follows:—O lord, the sun, and the gods who give life to man, receive me, and admit me into the society of the immortal ones; as I lived in this world, I religiously worshipped the gods whom my parents showed me, and I always honoured those who begat me, nor have I killed any man, nor have I defiled myself with what has been committed to my trust, nor have I done any thing which is inexpiable whilst I was alive, if I have sinned either by eating or drinking any thing which was not lawful, nor through myself have I sinned, but through others, showing the ark and chest which I have made, and the trails were. And having thus spoke, they throw the ark and chest into the river, but the rest of the balms as pure." The Grecians received this custom of superstition and idolatrous worship from the Egyptians, by Cecrops, Cadmus, Demochares, and Erechtheus, coming into Greece; and other customs transplanted from Egypt to Greece, and solemnities used at the burial of the dead, these, an encomium on the deceased added a part. From the Egyptians and especially the latter, the Romans received many of their laws and customs, as well as

polytheism and idolatrous worship. It is now, that the custom of making funeral orations in praise of the dead obtained among the Romans, and the manner in which their funeral services performed will be found described in § 9. The corpse being brought into their great oratory, the *Rostra*, the next of the kin *laudabat deum pro reſtris*, i. e. made a funeral oration, commendation principally of the party deceased, but touching the worthy acts also of those decessors whose images were there present. Tacitus says, that: "In all the funerals of especially in the public or indistinctive, the custom was first brought with a vast train of followers to the Forum; here one of the nearest relatives ascended the rostra, and obliged the audience with an oration in praise of the deceased. If not of the kindred undertook the office, it was performed by some of the most eminent persons for learning and eloquence, as Appianus of the funeral of Sylla. And Pliny the younger reckons it as the last addition to the honour of a very great man, that he had the honour of being praised at his funeral by the most eloquent man, then consul; which is agreeable to Livy's account of this matter, *Nam et sanctum*. For the funeral orations (says he) were very often on some public office, and by order of senate are many times given in charge to magistrates to be performed by themselves in public. The invention of this custom is generally ascribed to Valerius Poplicola, soon after the fall of the regal family. Plutarch tells us, honouring his colleague's obsequies with a funeral oration, it so pleased the Romans, that it became customary for the best men to celebrate the funerals of great persons with speeches in their commendations." Thus Julius Cæsar, according to Plutarch, made an oration in the rostra, in praise of his wife Cornelia, and his aunt Julia, when wherein he showed, that his aunt's descent, from his mother's side, was from kings, and by her was from the gods. Plutarch says, that "he was of the law of the Romans, which orderable praises to be given to women as well as men after death." Though by what he says of their place, it seems that the old Roman law was that funeral orations should be made only by elder women; and therefore he says, that this was the first that made one upon his own wife, it not being then usual to take notice of men or women in that way: but by that action he obtained much favour from the populace, who all ranks looked upon him, and loved him as a mild and good man. The reason why such a custom was made in favour of the women, Livy tells us, was this, That when there was such a want of money in the public treasury, that the king was forced upon to give the Gauls to break up the siege of the city and capitol could not be raised, the women collected among themselves and made a fund, who hereupon had not only thanks given but this additional honour, that after death, they should be solemnly praised as well as the men, which looks as if, before this time, only men had those funeral orations made for them.

FUNERAL RITES, ceremonies accompany-

ing the burial of any person. See **BURIAL**, § 2. The Latin word, *funus*, is derived from the Greek, *φύσις*, death. These rites differed among the ancients according to the different genius and religion of each country. See § 6—14.

(6.) **FUNERAL RITES, AMONG THE ANCIENT EGYPTIANS.** The first people who seem to have paid any particular respect to their dead, were the Egyptians, the posterity of Ham; as they were the first cultivators of idolatrous worship and superstition after the flood, they were also the first who asserted the immortality of the soul, in its migration into all kinds of animals in earth, air, and sea, and its return to the human body; which they supposed to be within the term of 3000 years. Hence proceeded their very great care in embalming their dead bodies, (see **CATACOMBS**, § 2; and **EMBALMING**), and their being at such vast expence in building proper repositories for them; for they were more solicitous about their graves than their houses. This gave birth to those wonders of the world, the pyramids, which were built for the burial of their kings, with such vast charges, and almost incredible magnificence. See **PYRAMID**. Whenever a person died among the Egyptians, his parents and friends put on mournful habits, and abstained from all banquets and entertainments. This mourning lasted from 40 to 70 days, during which time they embalmed the body. See **EMBALMING**. The embalmed body was restored to the friends, who placed it in a kind of open chest, which was preserved either in their houses, or in the sepulchres of their ancestors. But before the dead were deposited in the tomb, they underwent a solemn judgment, which extended even to their kings. Of this remarkable custom we have a particular account in the 1st book of Diodorus Siculus. "Those, who prepare to bury a relation, give notice of the day intended for the ceremony to the judges, and to all the friends of the deceased; informing them, that the body will pass over the lake of that district to which the dead belonged: when, on the judges assembling, to the number of more than 40, and ranging themselves in a semicircle on the farther side of the lake, the vessel is set afloat, which those who superintend the funeral have prepared for this purpose. This vessel is managed by a pilot, called in the Egyptian language **CHARON**; and hence they say, that Orpheus, travelling in old times into Egypt, and seeing this ceremony, formed his fable of the infernal regions, partly from what he saw, and partly from invention. The vessel being launched on the lake, before the coffin which contains the body is put on board, the law permits all, who are so inclined, to produce an accusation against it. If any one steps forth, and proves that the deceased has led an evil life, the judges pronounce sentence, and the body is precluded from burial; but if the accuser is convicted of injustice in his charge, he falls himself under a considerable penalty. When no accuser appears, or when the accuser is proved to be an unfair one, the relations, who are assembled, change their expressions of sorrow into encomiums on the dead; yet do not, like the Greeks, speak in honour of his family, because

because they consider all Egyptians as equally well born; but they set forth the education and manners of his youth, his piety and justice in maturer life, his moderation, and every virtue by which he was distinguished; and they supplicate the infernal deities to receive him as an associate among the blest. The multitude join their acclamations of applause in this celebration of the dead, whom they consider as going to pass an eternity among the just below." Such is the description which Diodorus gives of this funeral judicature, to which even the kings of Egypt were subject. The same author asserts, that many sovereigns had been thus judicially deprived of the honours of burial by the indignation of their people: and that the terrors of such a fate had the most salutary influence on the virtue of their kings.

(7.) FUNERAL RITES, AMONG THE ANCIENT GREEKS. It was usual sometimes before the interment, to put a piece of money into the mouth of the deceased, which was thought to be Charon's fare for wafting the departed soul over the infernal river. This ceremony was not used in those countries which were supposed to be situated in the neighbourhood of the infernal regions, and to lead thither by a ready and direct road. The corpse was likewise furnished with a cake, composed of flour, honey, &c. which was designed to appease the fury of Cerberus, the door-keeper of hell, and to procure the ghost a safe and quiet entrance. During the time the corpse continued in the house, there stood before the door a vessel of water: the design of which was, that those concerned about the body might purify themselves by washing; it being the opinion of the Greeks, as well as of the Jews, that pollution was contracted by touching a dead body. The ceremonies by which they expressed their sorrow for the death of their friends were various; but it seems to have been a constant rule to recede as much as possible in habit and behaviour from their ordinary customs. For this reason they abstained from banquets and entertainments; they divested themselves of all ornaments; they tore, cut off, or shaved their hair, which they cast into the funeral pile, to be consumed with the body of their deceased friend. Sometimes they throw themselves on the ground, and relied in the dust, or covered their head with ashes; they beat their breasts, and even tore their flesh with their nails, upon the loss of a person they much lamented. When persons of rank, such as public magistrates or great generals, died, the whole city put on a face of mourning; all public meetings were intermitted; the schools, baths, shops, temples, and all places of concourse, were shut up. After interment followed the *epulæ* or feasts, at which the company used to appear crowned; when they spoke in praise of the dead, so far as they could go with truth, it being esteemed a notorious wickedness to lie upon such an occasion. And not only at those feasts, but even before the company departed from the sepulchre, they were sometimes entertained with a panegyric upon the dead person. The Grecian soldiers, who died in war, had not only their tombs adorned with inscriptions, showing their names, parentage, and

exploits, but were also honoured with in their praise. The custom among them in the interment of their soldiers was namely, "They used to place the bodies of the dead in tents 3 days before the funeral, that persons might have opportunity to finish their relations, and pay their last respects. Upon the 4th day a coffin of cypress was made from every tribe, to convey the bodies of the dead to their own relations; after which went a cortege in memory of those whose bodies could not be found. All these, accompanied with the chief body of the people, were carried to the burying place, called *Ceramicus*, and there interred. One oration was spoken in commemoration of them all, and their monuments adorned with pillars, inscriptions, and all other ornaments about the tombs of the most honourable persons. The oration was pronounced by the chief of those deceased persons, who behaved most valiantly. Thus, after the famous battle of Marathon, the fathers of Callimachus and Pindarus were appointed to make the funeral oration. And upon the return of the fleet from the Sicilian expedition, which the solemnity was first held, the funeral oration was constantly repeated every year, when the Athenians were returning or laying the dead in the ground. It has been the most ancient practice among the Greeks; though burning came afterwards generally used among them. It was usual to throw into the funeral pile those garments which the deceased usually wore. The pile was kindled by one of the deceased's nearest relations, who made prayers and vows to the gods, that the body might quickly be consumed to ashes; and during the time of burning, the dead person's friends poured libations of wine, and called out the name of the deceased. See BURNING, § 5.

(8.) FUNERAL RITES, AMONG THE ANCIENT JEWS, were solemn and magnificent. When a person was dead, his relations and friends gathered about his body, and dressed it in their clothes; which custom is but followed by the modern Jews, who only cut off a lock of their garment, in token of affliction. When they were to bend the dead person's thumb into the palm, and fasten it in that posture with a cord, to signify the name of God, they thought the devil dared not to approach it. When they carried the body to the burying place, they made a speech to the following terms: "Blessed be God who formed thee, fed thee, maintained thee, and taken away thy life. O dead! be thou remembered, and shall one day restore you. Then they spoke the elegiac, or funeral oration of the deceased; after which they said, 'The soul of the deceased is called the *righteousness of judgment*; and the face of the deceased towards his friends is called out, "Go in peace."

(9.) FUNERAL RITES, AMONG THE ANCIENT ROMANS, were very numerous. The body was kept 7 days; and every day was sprinkled with hot water, and sometimes with incense. The deceased were only in a slumber, and thus waked; and every now and then their friends meeting, made a horrible noise about, with the same view; which

ned CONCLAMATIO. The last conclamation on the 7th day; when, if no signs of life shew'd, the defunct was dressed and embalmed by POLLINCTORES; placed in a bed near the door, with his face and heels towards the street; outside of the gate, if the deceased were of high station, was garnished with cypress boughs. At the close of these 7 days, an altar was raised at the head-side, called ACERRA; on which his family every day offered incense; and the libations provided things for the funeral. On the 7th day a crier was sent about the city, to invite the people to the solemnization of the funeral in these words: *Exequias L. Tit. L. filii, quibus est commotum, jam tempus est. Ollus* (i. e. ille) *ex adibus*. The people being assembled, and the conclamation ended, the bed was covered with a purple cloth: a trumpet-bearer marched forth, followed by women called *præfixæ*, singing longes in praise of the deceased: lastly, the bed followed, borne by the next relations; and if the person were of high rank and office, the waxen images of all his ancestors were carried before him on poles. The bier was followed by his children, kindred, and friends, *rati*, i. e. in mourning: from which act of mourning the funeral rites were called *præfixæ*. The body thus brought to the rostra, the orator made an oration in his praise and that of his ancestors. This done, the body was carried to the funeral pile, and there burnt: the first cutting off a finger, to be buried as a second solemnity. The body consumed, the friends were gathered; and the priest sprinkling the body thrice with clean water, the eldest son crying aloud, *ilicet*, dismissed the company, who took their leave of the deceased in these words, *Vale, vale, vale: nos te ordine quo permiserit sequemur*.—The ashes, inclosed in a leaden box, were laid in the sepulchre or tomb.

FUNERAL RITES AMONG THE CHINESE. See CHINESE, § 36, and CHINESE, § 12.

FUNERAL RITES AMONG THE NORTH AMERICAN INDIANS. See AMERICANS, § 9.

FUNERAL RITES AMONG THE PRIMITIVE CHRISTIANS. The ancient Christians testified their abhorrence of the Pagan custom of burning the dead, and always deposited the body in the ground: and it was usual to give the honour of embalming upon the male sex, if not upon others. They prepared the body for burial, by washing it with water, and dressing it in a funeral attire. The carrying of the body was performed by near relations, or persons of such dignity as the circumstances of the deceased required. Singing of psalms was a ceremony used in all funeral processions by the ancient Christians.

FUNERAL RITES IN THE CHURCH OF ROME.

When a Roman catholic is dead, they lay out the body, and put a crucifix in its hand. Next stands a vessel full of holy water, and the priest, that they who come in may sprinkle themselves and the deceased. In the meanwhile the priest stands by the corpse, and prays for the deceased till it is laid in the earth. In the funeral procession, the exorcist walks first, carrying a vessel of holy water; next the crossbearer; after which the friends of the deceased, and

towards the rest of the clergy, and last of all the officiating priest. They all sing the *miserere*, and some other psalms; and at the end of each psalm a *requiem*. We learn from Alet's ritual, that the faces of deceased laymen must be turned towards the altar, when they are placed in the church; and those of the clergy towards the people. The corpse is placed in the church surrounded with lighted tapers; after the office for the dead, mass is said; then the officiating priest sprinkles the corpse thrice with holy water, and as often throws incense on it. The body being laid in the grave, the friends and relations of the deceased sprinkle the grave with holy water.

(14.) The FUNERAL RITES OF THE GREEK CHURCH are much the same with those of the Latin. See § 13. It needs only to be added, that, after the funeral service, they kiss the crucifix, and salute the mouth and forehead of the deceased: after which each of the company eats a bit of bread and drinks a glass of wine in the church, wishing the soul a good repose, and the afflicted family all consolation.

(15.) FUNERAL SERMONS. The custom of the pagan Romans, in pronouncing funeral orations in praise of their deceased heroes, (§ 4,) appears to have been very early adopted by the Christians. Some of their funeral sermons or orations are still extant, as that of Eusebius on Constantine; those of Nazianzen on Basil and Cæsar; and of Ambrose on Valentinian, Theodosius, and others. Gregory, the brother of Basil, made a funeral oration, for Melitius bishop of Antioch: in which orations, they not only praised the dead, but addressed themselves to them, which seems to have introduced the custom of praying to departed saints. Now these orations were usually made before the bodies of the deceased were committed to the ground; which custom has been more or less continued ever since, to this day. Though this practice is now considerably improved, and cleared of many things which would smell too rank of paganism, and is even thrown into a method which, perhaps, may be of some service to Christianity; yet, notwithstanding this new dress, its original may very easily be discerned. The method in which the characters of deceased persons are given in our funeral sermons, is very much the same with that observed in those pagan orations; where first an account is given of the parentage of the deceased, then of his education; after that, we hear of his conduct in riper years: then his many virtues are reckoned up, with his generous, noble, and excellent performances.—Nor let the practice be condemned because of its rise and original; for why may not the custom of heathens, if just and laudable in themselves, and nowise pernicious to Christianity in their consequences, be followed by Christians? Only, since we are come into this practice, there is one thing we should take care to follow them in; and that is, not to make those funeral sermons or orations for every one; but for those only whose characters are distinguished, as eminently useful in the world, and in the church of Christ. The old heathens honoured those alone with this part of the funeral solemnity, who were men of probity and justice, renowned for their

wisdom and knowledge, or famous for warlike exploits: This, as Cicero informs us, (*De Legib.* l. 2.) being part of the law for burials; which directs, that the praises only of honourable persons shall be mentioned in the oration. It would be much more agreeable, therefore, if our funeral discourses were not so common, and if the characters given of the deceased were more just; devoid of that fulsome flattery with which they too often abound.

* **FUNERAL.** *adi.* [*funerea*, Latin.] Suits a funeral; dark; dismal.—

But if his soul hath wing'd the destin'd flight,
Inhabitant of deep disastrous night,
Homeward with pious speed repass the main,
To the pale shade *funereal* rites ordain. *Pope.*

FUNSKIRCHEN, or **FIVE CHURCHES**, a town of Hungary, and bishop's see, between the Drave and the Danube; 110 miles W. of Belgrade.

FUNGANDO, or } a kingdom of Africa, be-
FUNGENDO, } tween the Zaire and Coanza, subject to the king of Anliko.

(1.) **FUNGI**, [from *φύγος*, *fungus*,] in botany, the 4th order of the 24th class of vegetables, in the Linnæan system: comprehending all those which are of the mushroom kind, and which in Tournefort's constitute the 2d, 3d, 4th, 5th, 6th, 7th, and 8th, genera of the first section in the class xvii. This order contains 10 genera. See **AGARICUS**, **BOLETUS**, **CLAVARIA**, **LYCOPERDON**, &c. and **BOTANY**, *Index*.

(2.) **FUNGI**, an order of plants in the *Fragmenta Methodi Naturalis* of Linnæus. See **BOTANY**, *Index*. The ancients called fungi *children of the earth*, to indicate the obscurity of their origin. The moderns have likewise been at a loss in what rank to place them; some referring them to the animal, some to the vegetable, and others to the mineral kingdom. Messrs Wilek and Minchausen have not scrupled to rank these bodies among animal productions; because, when fragments of them or their seeds were macerated in water, these gentlemen perceived a quantity of animalcules discharged, which they supposed capable of being changed into the same substance. It was an ancient opinion, that *bees could produce bees*; but it was reserved to Messrs Wilek and Minchausen to suppose, that *bees could produce bees*. Wilek asserts, that fungi consist of innumerable cavities, each inhabited by a polype; and he does not hesitate to ascribe the formation of them to their inhabitants, in the same way as it has been said that the **CORAL**, the lichen, and the mucor, were formed. Hedwig has lately shown how ill founded this opinion is with respect to the lichen; and M. Durande has demonstrated its falsity with regard to the corallines. “Indeed (says M. Bonnet, talking of the animality of fungi) nothing but the rage for paradox could induce any one to publish such a fable; and I regret that posterity will be able to reproach our times with it. Observation and experiment should enable us to overcome the prejudices of modern philosophy; now, that those of the ancients have disappeared and are forgotten.” It cannot be denied that the mushroom is one of the most perishable of all plants, and it is therefore the most favourable for the generation of insects. Considering the quickness of its growth, it

must be furnished with the power of absorption; the extremity of its vessels much dilated than in other plants. Its root in many cases, to be merely intended for support, for some species grow upon stones or sand, from which it is impossible they can derive much nourishment. We must therefore conclude that it is chiefly by the stalk that they are nourished. These stalks grow in a moist and fair soil, in which float multitudes of eggs, so small that very insects they produce are with difficulty seen by the microscope. These eggs may be compared to the particles of the Byssus, 100,000 as M. Gleditsch says, are not equal to 1 grain. May we not suppose that a quantity of these eggs are absorbed by the vessels of the stalk, and that they remain there, without any change, until the plant begins to decay? Besides, the eggs may only be deposited on the surface of the plant, and may exist in the water into which they fall, for examination. Do not we see that seeds dispersed through the air, are hatched in paste, &c. and wherever they find a proper nidus for their development? Can we be surpris'd then, that the corruption of the water should make the water capable of sustaining beings that are really foreign to it? It is not more easy to acquiesce in the opinion of the naturalists who place the fungi in the mineral kingdom, because they are found growing upon stones, thence called *Lapides Fungar*, however, must be covered with a little water, and be watered with tepid water, in order to promote the growth. Such mushrooms are no more the produce of the stone, than the lichen of the rock to which it adheres, or the moss of the stone on which it is found. We have only the growth of mushrooms, to be convinced that this happens by development, and not by combination of parts as in mineral productions. In the opinion of Boeccone, who attributed the growth of mushrooms to a unctuous matter performing the function of the seed, and acquiring extension by apposition of parts; and that of Morison, who conceived that they grew spontaneously out of the earth, from a certain mixture of salt and sulphur, joined with the dung of quadrupeds, have never any adherents. Fungi are produced by development; they are subject to those vicissitudes natural to the duration of life which characterize living beings; they perish and die. They extract, by the extremity of their vessels, the juices with which they are nourished; they elaborate and assimilate these into their own substance. They are, therefore, to be considered as living beings, and consequently as belonging to the vegetable kingdom. But whether they are real plants, or only the production of a certain matter in dispute with the ablest philosophers, is still a matter in dispute with the ablest philosophers. Some ancient authors have pretended that the seed of mushrooms; but the opinion is never generally received. Petronius, laughing at the ridiculous magnificence of Trimalchio, relates, that he had written to the Indies for the seed of the morelle. The productions were generally attributed to the excessive humidity of rotten wood, or of other substances. The opinion took its rise from

grew most copiously in rainy weather. is the opinion of Tragus, of Bauhin, and columnna, who, talking of the peziza, says, substance was more solid and harder, but did not originate from rotten wood, but *pirrita* of the earth. It is not surprising times when the want of experiment rivation made people believe that insects : generated by putrefaction, we should opinion general, that fungi owed their o- he putrescence of bodies, or to a viscous analogous to putridity. Malpighi could y himself as to the existence of seeds which staniita had pretended to discover. He , that these plants must have them, or perpetuate themselves and shoot by frag- Micheli, among the moderns, appears to played himself most successfully on this

He imagined, that he not only saw the it even the stamina, as well as the little nt bodies destined to favour the dissemi- id the fecundation of these seeds. Before or, Lister thought he perceived seeds in us *perojus crassus magnus* of John Bauhin : round bodies that are found in the pezi- helvellæ, at that time, passed for seeds ; d not appear at all probable to Marfigli, ng that the eye, when assisted with the microscopes, could perceive nothing si- much larger fungi. Indeed these bodies the capsules or covers of the seeds, if not the seeds themselves. However this Marfigli, observing that fungi were often roots or branches, and that they wanted nd seeds, the means which nature em- the production of perfect plants, thought rarranted in doubting whether these be- d be ranked in the number of vegetables. bts of Marfigli prompted him to observa- tion of fungi. Their matrix he called he imagined they grew in places where with an unctuous matter, composed of xed with nitrous salt, which, by ferment- reduced heat and moisture, and insinua- between the fibres of wood ; that is, he them the production of a viscous and t humour. Lancini, in like manner, con- ngi as owing their existence to the pu- of vegetables, and supposed them a dif- e plant ; but he imagined, " that the fi- he tree were necessary to their produc- is the case in the formation of galls ; he l them to the warts and other excrescen- e human body. He added, that such vegetable tumors must necessarily assume rms and figures, from the fluids which : tubes and vessels relaxed by putrescence, ductility of the fibres and their direction, the action of the air. This opinion has ted by the celebrated naturalist M. de n the *Memoirs of the Academy of Sciences*

He maintains, that the fungi have a ogy with the lichen, which is allowed getable ; that, like the lichen, they are f stalk, branches, and leaves : that, like ow and are nourished upon the trunks of pieces of rotten wood, and on all sorts vegetables ; that they resemble the lichen

too in the rapidity of their growth, and the faci- lity with which many of them may be dried and restored to their former figure, upon being immer- sed in water ; and, lastly, that there is a great simila- rity in the manner in which their seeds are produced. He affirms, that only the warts and excrescences which grow on animal bodies, and the knots and other tumors that are to be found on trees, can be compared with one another ; for they are com- posed equally of the solid and liquid substance of the plant or animal on which they grow ; where- as, the matter of the fungi is not only quite dis- tinct from that of the plants on which they are found, but often entirely similar to the substance of those that spring immediately from the earth. The organization, says M. de Jussieu, which dis- tinguishes plants and other productions of nature, is visible in the fungi ; and the particular organi- zation of each species is constant at all times and in all places ; a circumstance which could not happen, if there were not an animal reproduction of species, and consequently a multiplication and propagation by seed. This is not, he says, an i- maginary supposition ; for the seeds may be felt like meal upon mushrooms with gills, especially when they begin to decay ; they may be seen with a magnifying glass, in those that have gills with black margins : and, lastly, says he, botanists can have no doubt that fungi are a distinct class of plants ; because, by comparing the observations made in different countries with the figures and descriptions of such as have been engraven, the same genera and the same species are every where found. Not- withstanding this refutation by M. de Jussieu, a- nother naturalist, M. de Necker, has lately main- tained, in his *Mycitologia*, That the fungi ought to be excluded from the three kingdoms of na- ture, and be considered as intermediate beings. He has observed, like Marfigli, the matrix of the fungi : and has substituted the word *carchte* (ini- tium faciens) instead of *fitus* ; imagining that the rudiment of the fungus cannot exist beyond that point in which the developement of the filaments or fibrous roots is perceived. He allows, that fungi are nourished and grow like vegetables ; but he thinks that they differ very much from them in respect of their origin, structure, nutrition, and rapidity of growth. He says, that the various vessels which compose the organization of vegeta- bles are not to be found in the fungi, and that they seem entirely composed of cellular substance and bark ; so that this simple organization is nothing more than an aggregation of vessels endowed with a common nature, that suck up the moisture in the manner of a sponge ; with this difference, that the moisture is assimilated into a part of the fun- gus. Lastly, That the fructification, the only es- sential part of a vegetable, and which distinguish- es it from all other organized bodies, being want- ing, fungi cannot be considered as plants. This he thinks confirmed, by the constant observation of those people who gather the morelle and the mushroom, and who never find them in the same spots where they have formerly grown. As the generation of fungi (says M. Necker) is always performed when the parenchymatous or cellular substance has changed its nature, form, and func- tion, we must conclude that it is the degeneration

of that part which produces these bodies. But if fungi were owing merely to the degeneration of plants, they would be still better entitled to constitute a new kingdom. They would then be a decomposition, not a new formation, or new bodies. Besides, we cannot deny, that in those bodies, which form the limit between the animal and vegetable kingdoms, the organization becomes simple, as the organs destined for nutrition are multiplied: but, as the last in the class of insects belongs to the animal kingdom, fungi ought, notwithstanding the simplicity of their organization, still to belong to the vegetable kingdom. The parenchymatous or cellular substance, which, as M. Bonnet says, is universally extended, embraces the whole fibrous system, and becomes the principal instrument of growth, must naturally be more abundant in these productions; and this accounts for the rapidity of their enlargement. Besides, growth, whether slow or rapid, never was employed to determine the presence or absence of the vegetable or animal character. The *draba verna*, which, in a few weeks shoots, puts forth its leaves, its flowers, and fruit, is not less a plant than the palm. The insect that exists but for a day, is as much an animal as the elephant that lives for centuries. As to the seeds of the fungi, it is probable that nature meant to withdraw from our eyes the dissemination of these plants, by making the seeds almost imperceptible; and it is likewise probable that naturalists have seen nothing but their capsules. Since, however, from the imperfection of our senses, we are unable to perceive these seeds, ought we to infer that they do not exist? Are we authorised to conclude this, because we do not find mushrooms where we have found them a year before? Undoubtedly not; for the greater part of plants require a particular soil, and the same mould that this year will foster a rare plant, will next year allow it to perish. Neither are we at liberty to deny the existence of these seeds, because those bodies which have been called their seeds, and the fragments or cuttings of the plants themselves, have not produced others of the same species. Nature seems to have reserved for herself the care of disseminating certain plants: it is in vain, for instance, that the botanist sows the dust found in the capsules of the orchis, which every one allows to be the seed. But, after all, what are those parts in the fungi casually observed by naturalists, and which they have taken for the parts of fructification? These are quite distinct from the other parts, and whatever may be their use, they cannot have been formed by prolongation of the cellular substance, or of the fibres of the tree on which the fungus grows: they are, therefore, owing, like flower and fruit, to the proper organization of the plant. These plants, therefore, have a particular existence, independent of their putrefying nidus. The gills of certain fungi, which differ essentially from the rest of the plant in their conformation, would be sufficient to authorize this latter opinion. But can putrefaction create an organic substance? Nature undoubtedly disseminates through the air and over the surface of the earth, innumerable seeds of fungi, as well as eggs of insects. The plant and the animal are excluded, when the nidus or the

temperature is favourable for their development. No fortuitous concurrence, either of atoms could produce bodies so exquisitely and so highly organized. It is sufficient to throw one on the beautiful plates which Schæffer has made of them, and compare them by the glass with warts and other excrescences of animals, to be convinced that they have not the same origin. The function of the cellular substance in vegetables is greatly superior to that in animals, if it produce any thing but deformities. The part of fungi exhibit a configuration muscular, constant, and uniform, to be the effect of chance or putrefaction. As this form is the same in all places where fungi have been found, it follows, that they contain the principles of their reproduction. They resemble mistletoe, and other parasitic plants, which are perfectly distinct from the trees on which they grow. The fungi, therefore, are organic living substances, or true plants. If the mode of their production is unknown, that of their seeds is so too.

FUNGIBLES, in Scots law, are such as are estimated by number, weight, or measure, as coin, butter, ale, &c.

FUNGITÆ, in natural history, a kind of file coral, of a conic figure, though flattened and striated longitudinally.

* **FUNGOSITY**. *n. f.* [from *fungus*.] An excrescence. *Dist.*

* **FUNGOUS**. *adj.* [from *fungus*.] Excessively spongy; wanting firmness.—It is often used to keep down the *fungous* lips that sprout from the bone; but it is much more painful in escharotick medicines. *Sharp's Surg.*

(1.) * **FUNGUS**. *n. f.* [Latin.] Strictly, a room: a word used to express such excrescent flesh as grow out upon the lips of wounds, or other excrescence from trees or plants not naturally belonging to them; as the agarick on the larch-tree, and auriculæ Judææ from elder.—The surgeon ought to vary the diet as long as the ulcers are too fluid, and produce *funguses*, or as they harden and produce *Arbuth. on Diet*.—This eminence is composed of little points, or granula, called *fungus*, or *flesh*. *Sharp*.

(2.) **FUNGUS**. See **SURGERY**, *Index*.

* **FUNICLE**. *n. f.* [*funiculus*, Lat.] A cord; a small ligature; a fibre.

* **FUNICULAR**. *adj.* [*funiculaire*, *funicle*.] Consisting of a small cord or fibre.

(1.) * **FUNK**. *n. f.* A stink. A low.

(2.) **FUNK** in geography, a small island in the Atlantic, near the NE. coast of Newfoundland. Lon. 52. 15. W. Lat. 50. 0. N.

FUNICABUN, a town of Persia, in the province of Mazanderan, 15 miles W. of Fareha.

(1.) * **FUNNEL**. *n. f.* [*infundibulum*, whence *fundible*, *fundle*, *funnel*.] 1. A hollow cone with a pipe descending from the top, by which liquors are poured into vessels with mouths; a tundish.—If you pour a glass of wine upon a bottle, it receives little of it; but if you pour it through a *funnel*, and by degrees, you shall fill the bottle. *Ben Johnson*.—

the long *funnel's* curious mouth extend, which ingested meats with ease denied.

Blackm. Forward ear or auricula is made hollow, acted by degrees, to draw the sound in as much as may be of it, as we used to pour liquor into any vessel. *Ray.* For passage of communication.—To the middle are two large *funnels*, bored in the roof of the grotto, to let in light or addition.

SMOKE OF A CHIMNEY, the shaft or part of the waste, where it is gathered in dimensions. Palladio directs, that the chimneys be carried throughout the house five feet at least, that they may carry clear from the house into the air. See FIRE-PLACE, &c. He also advises, that chimneys be not made narrower than 15 inches, nor broader than 15; for if wider, the smoke will not be able to make its way, and if too wide the wind will drive it into the room.

Lat. adi. Full of fun; merry. *Asb.*

FERMUNSTER, or FINSTERMINSTER, a town of the Helvetic republic, in Engadina; French, under Massena and Lecourbe, taken on the 26th March, 1799, but afterwards dislodged by the Austrians. A town of Naples, in the province of Terra, 21 miles SSE. of Solmona.

FUR. *n. f.* [*fourrure*, French.] 1. Skin or hair, with which garments are lined for warmth or covered for ornament.—December pressed with a horrid and fearful countenance, as also at his back a bundle of holly, a fur mittens the sign of Capricorn. —'Tis but dressing up a bird of prey in a fur to make a judge of him. *L'Est.*—A lordly gout wrapt up in fur, freezing asthma, loth to stir.

Swift. Furs of beasts found in cold countries, where they provide coats suitable to the weather; &c. &c.—

At night, wherein the cubdrawn bear would lie,

And the belly-pinched wolf
Seeks fur dry, unbonnetted he runs,
Which what will take all.

Shak. K. Lear. Animals as feed upon flesh qualify it, the one by allowing the hair or fur of the beasts upon, the other by devouring some of the feathers of the birds they gorge themselves. *Ray.* 3. Any moisture exhaled to great distance as that the remainder sticks on the

links I am not right in every part;
Kind of trembling at my heart:
The air unequal, and my breath is strong;
A filthy fur upon my tongue. *Dryd. Pers.*
FUR. *adv.* [It is now commonly written
at a distance.—

The white lovely dove
In her wings her utmost swiftness prove,
The gripe of falcon fierce not fur.

Sidney. FUR, or FURR, (§ 1. def. 1.) in commerce, the skins of wild beasts, dressed in alum

with the hair on; and used as a part of dress, by princes, magistrates and others. The kinds most in use are those of the ermine, sable, castor, hair, coney, &c. See CASTOR, § IV.; CAVIA, LEPUS, MUSTELA, &c. It was not till the later ages that the furs of beasts became an article of luxury. The refined nations of antiquity never made use of them; those alone who were stigmatized as barbarians were clothed in the skins of animals. Strabo describes the Indians covered with the skins of lions, panthers, and bears; and Seneca, the Scythians clothed with the skins of foxes and the lesser quadrupeds. Virgil exhibits a picture of the savage Hyperboreans, (*Georg. lib. 3. l. 382.*) similar to that which our late circumnavigators witnessed in the clothing of the wild Americans. Most part of Europe was then in similar circumstances. Cæsar might be as much amazed with the skindressed heroes of Britain, as our celebrated Cook was at those of his new-discovered regions. What time hath done to us, it may also effect for them; and it is to be hoped with much less bloodshed. Civilization may take place; and those spoils of animals, which are at present essential for their clothing, become merely objects of ornament and luxury. It does not appear that the Greeks or ancient Romans ever made use of furs. It originated in those regions where they most abounded, and where the severity of the climate required that species of clothing. At first it consisted of the skins only, almost in the state in which they were torn from the body of the beast; but as soon as civilization took place, and manufactures were introduced, furs became the lining of the dress, and often the elegant facing of the robes. It is probable that the northern conquerors introduced the fashion into Europe. We find, that about A. D. 522, when Totila king of the Visigoths reigned in Italy, the Suethons (or natives of Sweden) found means, by help of the commerce of numberless intervening people, to transmit, for the use of the Romans, *saphirinas pelles*, the skins of the sables. As luxury advanced, furs of the most valuable species, were used by princes as linings for their tents. Marco Polo, in 1252, found those of the Cham of Tartary lined with ermines and sables. He calls the last *Zibelines* and *Zambolines*. He says that those and other precious furs were brought from countries far north; from the land of Darkness, and regions almost inaccessible by reason of morasses and ice. The Welsh set a high value on furs, as early as the time of Howel Ddha, who reigned about 940. In the next age, furs became the fashionable magnificence of Europe. When Godfrey of Bologna and his followers appeared before the emperor Alexius Comnenus, on their way to the Holy Land, he was struck with the richness of their dresses, *tam ex ostro quam aurifrigio et nigro opere harmelino et ex mardrino grifinoque et vario*. How different was the advance of luxury in France from the time of their great monarch Charlemagne, who contented himself with the plain fur of the otter! King Henry I. wore furs; yet, in his dress was obliged to change them for warm Welsh flannel. But in 1337, the luxury had got to such a head, that Edward III. enacted, that all persons who could not spend 100l. a year should be prohibited the use of this kind of finery.

These,

These, from their great expence, must have been foreign furs, obtained from the Italian commercial states, whose traffic was at this period boundless. How strange is the revolution in the fur trade! The north of Asia at that time supplied us with every valuable kind; at present, we send, by means of the possession of Hudson's Bay, furs to an immense amount, to Turkey, and even to China.

(4.) FURS, VOYAGES LATELY MADE IN SEARCH OF. During Capt. Cook's last voyage to the Pacific Ocean, besides the various scientific advantages derived from it, a new source of wealth was laid open to future navigators, by trading for furs of the most valuable kind on the NW. coast of America. The first vessel which engaged in this new branch of trade, was equipped by some gentlemen in China. She was a brig of 60 tons and 20 men, commanded by James Hanna. She sailed from the Typa the end of April, 1785: proceeded northward, along the coast of China; passed through Diemen's Straits, the S. end of Japan; and arrived at Nootka in August following. Soon after her arrival, the natives, whom Capt. Cook had left unacquainted with the effects of fire arms, tempted probably by the diminutive size of the vessel (scarce longer than some of their own canoes), and the small number of her people, attempted to board her in open day; but were repulsed with considerable slaughter. This was the introduction to a firm and lasting friendship. Capt. Hanna cured such of the Indians as were only wounded; an unreserved confidence took place; they traded fairly and peaceably; a valuable cargo of furs was procured; and the bad weather setting in, he left the coast in the end of September, touched at the Sandwich Islands, and arrived at Macao, in the end of December. In May 1786, Captain Hanna sailed again from Macao, in the snow Sea Otter of 120 tons and 30 men, and returned to Macao in Feb. 1787. In this 2d voyage he followed his former track, and arrived at Nootka in August: traced the coast from thence as far as 53°, and explored the extensive sound discovered a short time before by Mr. Strange, and called by him Queen Charlotte's Sound, the latitude of which is 51° north, longitude 128 west. The snow Lark, Captain Peters, of 210 tons and 40 men, sailed from Macao in July 1786. Her destination was Kamtschatka (for which she was provided with a suitable cargo of arrack, tea, &c.) Copper Islands, and the NW. coast. Captain Peters was directed to make his passage between Japan and Corea, and examine the islands to the north of Japan, said to be inhabited by hairy people. No account having been received of this vessel since her departure, there is every reason to fear she has perished. In the beginning of 1786, two coppered vessels were fitted out at Bombay, under the direction of J. Strange, Esq. who was himself a principal owner. These vessels were, the snow Captain Cook, of 300 tons, and snow Experiment of 100 tons. They proceeded in company from the Malabar to Batavia; passed through the Straits of Macassar, where the Experiment was run upon a reef, and was obliged to haul ashore upon Borneo to repair; from thence they steered to the E. of the Palaos Islands; made Sulphur Island;

and arrived at Nootka the end of June following. From Nootka, where they left their surgeon-mate (Mackay) to learn the language and collect skins against their intended return (but which was brought away in the Imperial Eagle the following year), they proceeded along the coast to Charlotte's Sound, of which they were the first discoverers; from thence in a direct course to William's Sound. After some stay there, the Experiment proceeded to Macao (their vessels provided with passes by the governor general of Goa): the Captain Cook endeavoured to visit Copper Island, but without success, being prevented by constant west winds. Two coppered vessels were also fitted out by a society of gentlemen in Bengal, viz. the snow Nootka of 200 tons and snow Sea Otter of 100 tons, commanded by John Meares and William Tipping, lieutenants in the royal navy. The Nootka sailed in May 1786, from Bengal; came through the China Sea, touched at the Bathes, where they were very badly treated by the Spaniards, who had taken possession of these islands; arrived at Oonalashish the beginning of August; found there a Russian ship and some furriers; discovered accidentally Cape Greville a new strait into Cook's River, 10 leagues wide, and 30 long; saw some Aleutian hunters in a small bay between Cape Elizabeth and Cape Bear; and arrived in Prince William's Sound the end of September. They determined on wintering in Snug Corner Cove, lat. 60. N. (which seem placed by providence for the convenience and refreshment of the adventurers in the fur trade,) and were frozen up in this gloomy and frightful spot from the end of November to the end of May. By the severity of the winter they lost their 3d and 4th mates, surgeon, boatman, carpenter, and cooper, and 12 of the foremen; and the remainder were so enfeebled, that they were under the necessity of applying to the commanders of the K. George and Q. Charlotte, which just at this time arrived in the sound, for assistance and hands to assist in carrying the vessel to the Sandwich Islands, where, giving over all further trade, they determined, (after getting a few barrels of fish off Cape Edgecumbe) immediately to proceed. The Nootka arrived at Macao in the end of October, 1787. The Imperial Eagle, Capt. Barkley, fitted out by a society of gentlemen at Ostend, sailed from Ostend the end of November, went into the bay of All Saints; thence to the Sandwich Islands, and arrived at Nootka the beginning of June; thence to the S. as far as 53°, in which space he discovered some good and spacious harbours. In lat. 47° 46', lost his 3d mate, purser, and two seamen, who were on a trading party with the long-boat, and were accidentally trusting themselves ashore, unarmed, cut off by the natives. This place seems to be the same that Don Antonio Mourelle calls the *Los Dolores*, where the Spaniards going ashore for water, were also attacked and cut off. The K. George of 320, and the Queen Charlotte of 200 tons, commanded by Capt. Portlock and Dr. Ross, who served under Captain Cook, in his last voyage, were fitted out by a society of gentlemen in England, who obtained a privilege to trade

of America, from the South Sea and companies. Those vessels sailed from the beginning of Sept. 1785; touched at the Sandwich Islands, and arrived at Cook's River in August. From thence, taking a few furs, they steered, in the direction for Prince William's Sound, intending to land there; but were prevented by heavy weather which obliged them to bear away, and to winter at the other part of the coast. The weather accompanied them till they arrived at Nootka Sound, when they were so near that a canoe came off to them; but as they were near accomplishing their purpose, a storm came on, and obliged them finally to return for the Sandwich Islands, where they spent the winter months; and returning again in May, arrived in Prince William's Sound in May. The King George remained in Prince William's Sound; and during her stay, Captain Cook discovered a new passage from the Cook's River. The Queen Charlotte sailed along the coast to the south; looked into the Bay, where the Russians have now a settlement; examined that part of the coast from Dixon's, Queen Charlotte's Islands, at a distance from the Main, which is farther than it was supposed to be: some part of it may, however, be seen from the English islands; and it is probable the distance does not exceed any where 50 leagues. On the 10th, Hudson's House, lat. 53° lon. 106° will not be more than 80 miles distant from this part of the coast in the same parallel. It is not improbable, that the enterprising Canadian furriers may penetrate to this communication with which is probably situated by lakes and rivers), and add to the comforts and luxuries of Europe this valuable trade in warmth, beauty, and magnificence, the richest furs of Siberia. These ships, bringing off their furs in China, were loaded on account of the English company, sailed from Amboyna in the end of February, and arrived in England a short time since, after an absence of two years. The year after the departure of the King George and Queen Charlotte, the same company sent out other two vessels, viz. the Prince of Wales, of 60 tons, and the Prince of Wales, commanded by Captains Colnet and the former of whom had served under Cook. These vessels left England in August, and arrived at New Year's harbour on Staten Land where they left an officer and 12 men to await the arrival of a vessel which was expected from England: from thence they sailed directly to Nootka, where they arrived in July, sickly and in bad condition; and the Imperial Eagle, which had left Europe before them. Leaving Nootka, they sailed along the shore to the northward, and soon met with the Queen Charlotte. In the beginning of the year 1788, Capt. Mears sailed with two other vessels, the Felice, which he commanded himself, and the Iphigenia, Captain Cook, to Nootka Sound. But the history of

his settlement at Nootka, with the insolent behaviour of Don Martinez, the Spanish commander, (which had nearly occasioned a war between Britain and Spain, but was at last amicably settled,) will be found under the article NOOTKA. We have only to add here, that some accounts of the voyages above-mentioned, the fur trade in those parts, had at first been greatly magnified. In that published by Captain Portlock, however, he observes, that "the gains hitherto have certainly not been enviably great; though the merchants have no doubt found the trade lucrative." And later accounts assure us, that it is now become extremely advantageous.

* *To FUR. v. a.* [from the noun.] 1. To line or cover with skins that have soft hair.—How mad a sight it was to see Dametas, like rich tissue *furred* with lambskins? *Sidney*.—

Thro' tatter'd cloaths small vices do appear;
Robes and *furr'd* gowns hide all.

Shakesp. K. Lear.

You are for dreams and slumbers, brother priest;

You *fur* your gloves with reasons. *Shakesp.*

2. To cover with soft matter.—To make lamp-black, take a torch and hold it under the bottom of a latten basin; and as it groweth to be *furred* and black within, strike it with a feather into some shell. *Peacham*.—

Three sisters, mourning for their brother's loss,
Their bodies hid in bark, and *furr'd* with moss.

Dryden.

Their frying blood compels to irrigate

Their dry *furr'd* tongues. *Philips.*

A dungeon wide and horrible; the walls
On all sides *furr'd* with mouldy damp, and
hung

With clots of ropy gore. *Addison.*

FURA, a small island on the W. coast of Scotland, 4½ miles W. of Udrigill Head.

* *FURACIOUS. adj.* [*furax*, Lat.] Thievish; inclined to steal. *Diſ.*

* *FURACITY. n. f.* [*furax*, Lat.] Disposition to theft; thievishness.

FURANS, a river of France, which runs into the Meuse, near Romans.

FURBECK, a village in Yorkshire, near Blith.

* *FURBELOW. n. f.* A piece of stuff plaited and puckered together, either below or above, on the petticoats or gowns of women. This, like a great many other words, is the child of mere caprice. *Trev. Diſ.*—

Nay, oft in dreams invention we bestow

To change a flounce, or add a *furbelow*. *Pope.*

To FURBELOW. v. a. [from the noun.] To adorn with ornamental appendages of drets.—

When arguments too fiercely glare,

You calm them with a milder air;

To break their points, you turn their force,

And *furbelow* the plain discourse. *Prior.*

—She was flounced and *furbelowed*; every ribbon was crinkled, and every part of her garments in curl. *Addison.*

* *To FURBISH. v. a.* [*furbir*, French.] To burnish; to polish; to rub to brightness.—

It may enter Mowbray's waxen coat,

And *furbish* new the name of John o' Gaunt.

Shakesp.

—*Fur-*

—*Furbish* the spears, and put on the brigandines. *Jer.* xlv. 4.—Some others who *furbish* up and reprint his old errors, hold that the sufferings of the damned are not to be, in a strict sense, eternal; but that, after a certain period of time, there shall be a general gaol delivery of the souls in prison, and that not a farther execution, but a final release. *South.*—

As after Numa's peaceful reign,
The martial Ancus did the sceptre wield;
Furbish'd the rusty sword again,
Resum'd the long-forgotten shield,
And led the Latins to the dusty field. *Dryden.*
Inferior ministers, for Mars repair
His broken axle-tree, and blunted war;
And send him forth again, with *furbish'd* arms. *Dryden.*

* **FURBISHER.** *n. s.* [*sourbisseur*, French; from *furbish*.] One who polishes any thing.

FURCA, in antiquity, a piece of timber resembling a fork, used by the Romans as an instrument of punishment. The punishment of the *furca* was of three kinds: the first only ignominious, when a master, for small offences, forced a servant to carry a *furca* on his shoulders about the city. The 2d was penal, when the party was led about the circus, or other place, with the *furca* about his neck, and whipped all the way. The third was capital, when the malefactor having his head fastened on the *furca*, was whipped to death.

* **FURCATION.** *n. s.* [*furca*, Lat.] Forkiness; the state of shooting two ways like the blades of a fork.—When stags grow old they grow less branched, and first lose their brow-antlers, or lowest *furcations* next the head. *Brown's Vul. Err.*

FURCHE, in heraldry, a cross forked at the ends.

FURETIERE, Antony, a learned French lawyer, born at Paris in 1620. He was eminent in the civil and canon law, and an advocate in the parliament. Afterwards taking orders, he became abbot of Chalvey, and prior of Chuines. He wrote many works, but is chiefly valued for his *Universal Dictionary of the French Tongue*, in which he explains the terms of art in all sciences; and which was published after his death. He was of the French academy, and the disputes he had with some members of it made much noise. He died in 1688.

* **FURFUR.** *n. s.* [Latin.] Husk or chaff, or scurf or dandriff, that grows upon the skins, with some lickness to bran. *Quincy.*

* **FURFURACEOUS.** *adj.* [*furfuraceus*, Lat.] Husky; branny; scaly.

FURIA, in zoology, a genus of insects belonging to the order of vermes zoophyta. There is but one species, viz. the

FURIA INFERNALIS. It has a linear smooth body ciliated on each side, with reflexed feelers pressed to its body. In Finland, Bothnia, and the northern provinces of Sweden, people were often seized with a pungent pain, confined to a point, in the hand or other exposed part of the body, which presently increased to a most excruciating degree, and sometimes proved suddenly fatal. This disorder was particularly observed in Finland, especially about boggy and marshy places,

and always in autumn. At length it was discovered that this pain instantly succeeded some that dropped out of the air, and in a moment penetrated and buried itself in the flesh. The landers had tried a variety of applications for purpose, until at length a poultice of curd cheese was found the most effectual in easing pain; and the event confirmed that the insect allured by this application to leave the flesh on its removal; this worm, no longer than sixteenth of an inch, was found in it, and the cause of this painful disease explained. What means this creature is raised into the air as yet unknown.

FURIAE, } in Pagan mythology, goddesses
FURIES, } whose offices it was to punish guilty after death. They sprang from the blood of the wound which Coelus received from Saturn. According to others, they were daughters of Earth, and conceived from the blood of Saturn. Some make them daughters of Aëther and Night, or Pluto and Proserpine. According to the more received opinions, they were three in number, Tisiphone, Megæra, and Alecto, which some add Nemesis. Plutarch mentions only one called *Adrasta*, daughter of Jupiter and Necessity. They were supposed to be the ministers of the vengeance of the gods; stern and terrible; always employed in punishing the guilty upon earth, as well as in the infernal regions. They were also called **EUMENIDES** and **ERINYES**. The Athenians stilled them *epourneiai*, very good goddesses. Their worship was almost universal, and people dared not to mention their names without fix their eyes upon their temples. They were honoured with sacrifices and libations; and at Chaia they had a temple, which, when entered by any one guilty of a crime, suddenly rendered him furious and deprived him of the use of reason. In the sacrifices, the votaries used branches of cedar and of alder, hawthorn, saffron, and juniper; and the victims were generally turtles and sheep, with libations of wine and honey. They were usually represented with a grim and frightful aspect, with a black and bloody garment, and with serpents wreathing round their heads instead of hair. They held a burning torch in one hand, to discover the guilty, and iron chains and whips of scorpions in the other to punish the guilty, and were always attended by Terror, Rage, Madness, and Death. In hell they were seated at Pluto's throne, as the ministers of his vengeance. They were worshipped at Casina, in Arcadia, at Carmia in Pelopponesus. They had a temple at Athens near the Areopagus, and their priests were chosen from amongst the judges of that city. At Telphusa, a city in Arcadia, a black ewe was sacrificed to them.

* **FURIOUS.** *adj.* [*furieux*, Fr. *furius*, L. *furiosus*.] 1. Mad; frantick.—No man did ever think the hurtful actions of *furious* men and innocents unpunishable. *Hooker.* 2. Raging; violent; transported by passion beyond reason.—

Who can be wise, amaz'd, temperate,
furious,
Loyal and neutral in a moment? No man.

Alexander Pope.

To be *furiosus*,

: frightened out of fear; and in that mood,
we will peck the estridge. *Shakesp.*
e, other than the sound of dance or song,
nt, and loud lament, and *furiosus* rage.

Milton.

; impetuously agitated.—

: clamour thence the rapid currents drive,
is the retreating sea their *furiosus* tide.

Milton.

IOUSLY. *adv.* [from *furiosus*.] Madly;
vehemently.—

h when his brother saw, fraught with
at grief

ath, he to him leapt *furiously*. *Fairy Q.*
bserve countenance to attend the prac-

this carries them on *furiously* to that
if themselves they are inclined. *South.*—
heard not half, so *furiously* she flies;

ve her wings. *Dryden.*

OUSNESS. *n. s.* [from *furiosus*.] Frenzy;
transport of passion.

RIUS *BIACULUS*, a Latin poet, who
about A. A. C. 103. He wrote annals

of which Macrobius recites some frag-
uetonius also relates some verses of his

is Cato, in his *Illustrious Grammarians*.

PART. I.

(1.) * FURNACE. *n. s.* [*furnus*, Lat.] An in-
closed fireplace.—

Heat not a *furnace* for your foe so hot

That it may singe yourself. *Shak. Henry VIII.*

—The fining pot is for silver, and the *furnace* for
gold. *Prov.*—We have also *furnaces* of great di-

versities, that keep great diversity of heats. *Bacon.*

—The kings of Spain have erected divers *furnaces*
and forges, for the trying and fining of their gold.

Abbot.—Whoso falleth not down and worshippingeth,
shall the same hour be cast into the midst of a

burning fiery *furnace*. *Daniel.*—

A dungeon horrible, on all sides round,

As one great *furnace*, flam'd. *Milt. Par. Lost.*

(2.) A FURNACE is intended to contain fire, or
to raise and maintain a vehement fire, whether of

coals or wood. Of these there are great variety,
according to the different uses to which they are

applied.

(3.) A FURNACE, CHIEF OBJECTS TO BE AT-
TENDED TO, IN ERECTING. In all furnaces the

principal things to be attended to are, 1. To con-
fine the heat as much as possible to the matter to

be operated upon; 2. To prevent its being dissi-
pated; 3. To produce as much heat with as little

fuel as possible; and, 4. To have it in our power
to regulate the degree of heat according to our

pleasure. To answer the first intention, the fire is
usually confined in a chamber or cavity built on

purpose for it, and furnished with a door for put-
ting in the fuel; a grate for supporting it, and al-

lowing air to pass through, as well as the ashes to
drop down into a cavity provided on purpose, and

called the *ash pit*. Thus the heat produced by
the inflamed fuel is confined by the sides of the

furnace, and obliged to spend great part of its
force upon the subject inclosed. The 2d inten-

tion, viz. to prevent the dissipation of the heat, is
obtained by shutting the door of the furnace;

taking care that the chimney be not too wide, and
that the matter to be acted upon be placed in such

a manner, that the fire may have its full effect upon
it as it goes up the chimney. The 3d intention,

which is the most important, is at the same time
the most difficult to answer, and depends entirely

upon the proportion between the spaces betwixt
the furnace bars and the wideness and height of the

chimney. This will appear from a consideration of
the principles on which the degrees of inflamma-

tion are produced. These depend entirely on the
current of air which passes through the inflamed

fuel. As soon as the fuel is set on fire, a certain
degree of heat is produced; but unless a constant

influx of air is admitted through the burning fuel,
the fire is instantly extinguished; nor is it possible

by any means to renew the inflammation until we
admit a stream of fresh air among the fuel. When

this is done, a rarefaction commences in the air of
the fire-place of the furnace; so that it is no longer

a counterpoise to the external air, and is therefore
driven up the chimney by that which enters at the

ash pit. This again passing through the fuel, is
rarefied in its turn; and giving place to fresh

quantities, there is a constant flow of air up the
chimney. In proportion to the rarefaction of the

air in the fire-place, the greater is the heat. But
by a certain construction of the furnace, the un-

der part of the chimney will become almost as
strongly

strongly heated as the fire-place; by which means, though a very strong current of air is forced thro' the fuel, yet as great part of the heat is spent on the chimney, where it can be of no use, the fuel is wasted in a very considerable degree. To avoid this, we have no other method than to contract the throat of the chimney occasionally by a sliding plate; which when put quite in, shuts up the whole vent; and by being drawn out more or less, leaves a larger or smaller vent at pleasure. This plate ought to be quite drawn out till the fuel is thoroughly kindled, and the furnace well heated, so that a current of air may flow strongly through the fuel. After this the plate is to be put in a certain length, so as just to prevent the smoke from coming out at the door of the furnace. The rarefaction of the air in the fire-place will solicit a very considerable draught of air, which will keep the fuel inflamed to a great degree; at the same time that the heat, being reflected from every part of the furnace excepting that narrow passage where the smoke goes up, becomes very intense. A large quantity of fuel may be put in at once, which will consume slowly, and thus require but little attention in comparison with those furnaces where no such precaution is used. The sliding-plate may be made of cast iron in those furnaces where no great heat is excited; but in others fire-clay will be more convenient. The contrivance, however, is scarce applicable to those furnaces where great quantities of metal are to be melted; and accordingly the waste of fuel there is immense. It is computed, that the iron works of Carron in Stirlingshire consume annually as many coals as would be sufficient for a city containing 700,000 inhabitants. The 4th intention, viz. that of regulating the heat, is accomplished by allowing only a certain quantity of air to pass through the fuel. For this purpose, says Dr Black, it is necessary to have the command of the furnace below; the parts above being frequently filled with small quantities of soot. The best method of managing this is to shut up the door of the ash-hole perfectly close, and to have a set of round holes bearing a certain proportion to one another; and their areas being as 1, 2, 4, 8, 16, &c. Seven or eight of these ought to be made in the door of the ash-pit, which will give a sufficient command over the fire. When the fire is to be increased to the utmost, all the passages both above and below are to be thrown open, and the height of the vent augmented; which, by increasing the height of the column of rarefied air, increases also the motion of that through the fuel, and of consequence also the heat of the furnace. Macquer recommends another tube applied to the ash-pit, widest at the end farthest from the furnace, and tapering gradually towards it. The intention of this is to augment the current and velocity of the air, by its being made to pass from a wider into a narrower vent; but though this is no doubt true, the air will not ultimately move with greater velocity than if the tube were not there. It can only be useful therefore in cases where the furnace is placed in a small room, and the tube itself has a communication with the external air.

(4.) FURNACE, CUPELLING, or } is thus described

(4.) FURNACE, ESSAYING, } bed in Gra-

mer's *Art of Essaying*: (See *Plate CLII* with iron plates a hollow quadrangular inches broad and 9 inches high, *aa* & top in a hollow quadrangular pyramid inches high, terminating in an aperture inches square. This prism must be closed at the bottom with another iron plate, which shall be the basis or bottom to it, *aa*. 1. Near the top make a door, *e*, 3 inches high, and 5 inches wide that leads to the ash-hole. 2. Above this door, and at the height of 6 inches from the top, make another door, *f*, of the figure of a circle, 4 inches broad at its basis, and 4 inches high in the middle. 3. Then fasten a plate, *gg*, 11 inches long, and half an inch thick, so that its lower edge shall be at the bottom of the furnace, with 3 or 4 nails in such a manner, that there may be a groove between the upper edge of the said plate and the bottom of the furnace, so wide, as that the lower door, *kk*, may be put into it, and move backwards and forwards therein. 4. Make a 2d plate, *bb*, 11 inches long, 3 inches high, and perfectly parallel to the foregoing plate, and fasten it in the space between the two doors in such a manner, that both the upper and the lower of it may form a hollow groove with the furnace. One of these grooves, widened downwards, serves to receive the sliders that shut the lower door. The other, that turns upwards, is to receive the sliders of the small door. 5. The 3d plate, *ii*, which is likewise 11 inches long, must be rivetted close above the upper door, in such a manner that it may form a groove with the upper door, *ff*, widened downwards, and contiguous to the upper door, *ff*. 6. To shut the upper door, *ff*, adapt to each of them two sliders of iron plates, that they may move within the above-mentioned grooves, *kk*, *ll*. But the sliders belonging to the upper door, *ff*, each a hole near the top; that is, one hole the 5th part of an inch broad, and one hole a half long, *m*; and the other a semicircular aperture, one inch high and two inches wide. Let, besides, each slider have a handle, by which it may be laid hold of when they are to be moved. 7. Moreover, let 5 round holes, one inch in diameter, be bored in the furnace; two of which shall be made in the fore part of the furnace, and three in the back part; all at the height of 6 inches from the bottom, but 3½ inches distant from each side of the furnace; and, finally, a 5th hole, the height of one inch above the upper door, *f*. 8. In short, let the furnace be armed with iron books, half an inch thick, and about 3 inches distant from each other, to fasten the lute with which the furnace is to be covered over within. 9. Let there be a moveable, hollow, quadrangular pyramid, 9 inches high, be adapted to the upper door, *f*, of the furnace, at the basis 7 inches broad, and 9 inches high, upwards in a hollow tube, *r*, 3 inches in diameter, 2 inches high, almost cylindrical, the top a little convergent at top. This pyramid serves to support a funnel or flue, which

Furnace

cal, hollow, made of iron plates, and a; and which, when a very strong fire is, is put perpendicularly upon the shorter such a manner, that it enters close into it, inches deep, and may again be taken off re, when there is no need of so strong a is pyramidal cover, q, must have a handle adapted to it, that it may be laid hold thus be taken off or put on again: and being put on the aperture, d, of the furnace, not be easily thrown down, let an iron rivetted to the right and left upper edge mace, r, and be turned down towards e, so as to make a furrow open before nd, into which the lateral edges of the y enter and be fastened, and at pleasure l backwards and forwards, whenever it put on or moved. g. Let a square ledge, a thick iron plate, be fastened at the top per edge of the lower door, e, to support and the lute; but it must be made of es, that it may be easily introduced into y of the furnace. This assay oven must is be covered over on the inside with lute, s:—That the fire may be better confined, the iron may not be destroyed by growth, the whole inside of the furnace must ed over with lute, one finger or one finger half thick. The lute fit for this is de- under CHAMISTAY. But before using this t put within the furnace small iron bars, length to the diameter of the oven, quar- r, prismatical, half an inch thick, having remities supported by a square iron ledge, an inch distant from each other; and fast- so, that their flat sides may be oblique ard to the transverse section of the fur- d that the two opposite angles may look ards and the other downwards: the bars be laid flat, but edgewise; by which fi- be ashes of the fuel are prevented from tained too long between the interstices on bars, and from making an obstruction old oppose the free draught of the air. iace being then covered over with lute, d up by a gentle heat, is at last fit for do- d operations, and especially for such as performed in the assay oven. When an n is to be made in this furnace, let through ver holes above described, oo, before and and directly opposite to each other, two s one inch thick, and long enough that remities on every side may jut a little out holes. These serve to support the muffle bottom. Then introduce the muffle the upper aperture of the furnace, d, and upon the above described iron bars, in nanner that the open fore side of it may iguous to the inward border of the upper . The fuel is introduced through the top urnace, d; the cover of which, q, on this t, must be moveable, and not very heavy. If fuel is charcoal made of the hardest especially of beech, broken into small pieces igness of an inch, wherewith the muffle e covered over some inches high. Large would not answer, because they could not ough the narrow interstices, between the

sides of the muffle and those of the furnace, and of course could not sufficiently surround the circumference of the muffle; so that there would be on every side places void of fuel, and the fire would be either not strong enough or unequal. But if, on the contrary, coals too small were used, then a great part would fall immediately through the interstices of the grate into the ash hole; the smallest parts of them would turn too soon into ashes, and by increasing the heap of ashes, obstruct the free draught of the air, which is here very requisite. A perfect management of the fire is necessary in performing operations in this furnace; therefore the chemical reader must give attention to what follows. If the door of the ash hole, e, is quite open; and the sliders of the upper door, f, drawn towards each other, so as to touch one another in the middle of the door; and if, besides, the cover, q, and the funnel adapted to its tube, r, are upon the top, d, of the furnace; the fire will be then in the highest degree possible; though, in the mean time, it is hardly ever necessary to put the funnel on, except in a very cold season: but if, after having disposed the furnace in the manner just described, red burning coals are put into the open upper door, f, of it, the fire is still more increased thereby: however, this is very seldom or never necessary. When the upper door is shut with only that slider that has a narrow oblong hole in it, m, then the heat becomes a little less; but it diminishes still more when shut with the other slider, that has in it the semicircular hole, n, which is larger than that of the first slider: nay, the heat again is less when the funnel put at the top of the cover is taken away: Finally, the door of the ash-hole being either in part or totally shut, the heat is still diminished; because the draught of air so necessary to excite the fire is thereby hindered: but if, besides all these, the upper door be opened wide, then the cold air rushing into the muffle, cools the bodies put under it, that are to be changed, to a degree incompatible with any operation, as it will entirely hinder the boiling of the lead. If, during the operation, the fire begins to decay, or to grow unequal, it is a sign that there are places void of coals between the sides of the furnace and those of the muffle: therefore, in this case, the coals must be stirred on every side with an iron rod, introduced through the upper hole, p, of the furnace, that they may fall together, and thus act equally and in a proper manner. However, the effect does not always uniformly answer, even when the apparatus has been made with all the exactness mentioned. The cause of this difference has most commonly its origin in the various dispositions of the air: for as every fire is more excited, in proportion as the air, more condensed, and more quickly agitated, strikes the fuel more violently (which the effect of the bellows plainly shows); it thence appears, that in warm and wet weather, when the atmosphere is light, the fire must be less efficacious in furnaces; that likewise, when several furnaces, situated near each other, are burning at the same time, the fire is in part suffocated, because the circum-ambient air is thereby rendered more rare and lighter. The same effect is produced by the sun, especially in summer, when it shines upon the place where the

furnace is situated. The atmosphere, on the contrary, being heavier in cold dry weather, excites a very great fire. The heat of the fire acts the stronger upon the bodies to be changed, as the muffle put in the furnace is less; as it has more and larger segments cut out of it; as its sides are thinner; in short, as there are more vessels placed in the hinder part of it; or the contrary. In this case, when many of the conditions requisite for the exciting of fire are wanting, the artificer, with all his skill, will hardly be able to excite the fire to a sufficient degree, to perform operations well, in common assay-ovens, even though he uses bellows, and puts coals into the upper door of the furnace. For this reason, the grate ought to be put almost 3 inches below the muffle, lest the air, rushing through the ash-hole, should cool the bottom of the muffle, which happens in common assay-ovens; and again, that the smaller coals, almost already consumed, and the ashes, may more easily fall through the interstices of the grate, and the larger coals still fit to keep up the fire be retained. Lastly, the above-mentioned funnel is added, that the blowing of the fire being, by means of it, increased as much as possible, this may at last be carried to the requisite degree; for the fire may always be diminished at pleasure, but cannot always be increased, without the assistance of a proper apparatus.

(5—9.) FURNACE, EVAPORATING, FORGE, IMPROVED BLAST, LAMP, AND MELTING. See CHEMISTRY, *Index*.

(10.) FURNACE, Mr WATT'S STEAM-ENGINE. The steam-engine furnace is described in the specification of the patent obtained for the invention by Mr Watt of Birmingham. His "improved methods of constructing furnaces, or fire-places, consist in causing the smoke or flame of the fresh fuel, in its way to the flues or chimney, to pass, together with a current of fresh air, through, over, or among, fuel which has already ceased to smoke, or which is converted into coaks, charcoal, or cinders, and which is intensely hot; by which means the smoke and grosser parts of the flame, by coming into close contact with, or by being brought near unto, the said intensely hot fuel, and being mixed with the current of fresh or unburnt air, are consumed, or converted into heat, or into pure flame free from smoke." This is done, "first, by stopping up every avenue or passage to the chimney or flues, except such as are left in the interstices of the fuel, by placing the fresh fuel above, or nearer to the external air, than that which is already converted into coaks or charcoal; and by constructing the fire-places in such a manner that the flame, and the air which animates the fire, must pass downwards, or laterally, or horizontally, through the burning fuel, and pass from the lower part, or internal end or side, of the fire-place, to the flues or chimney. In some cases, after the flame has passed thro' the burning fuel, it is made to pass through a very hot funnel, flue, or oven, before it comes to the bottom of the boiler, or to the part of the furnace where it is proposed to melt metal, or perform other office, by which means the smoke is still more effectually consumed. In other cases, the flame is carried immediately from the fire-place into the space un-

der a boiler, or into the bed of a melting furnace. *Fig. 2, Plate CLIX*, shews a fire-engine boiler, and its furnace, which has been chosen for an example of the application of this new method to the heating and evaporation of water. A A is the boiler, which may be of any form suitable to its use. B B is a flue rounding the boiler as usual. C is the upper passage from the space under the boiler to the flues. D D is a funnel or flue for the smoke to come from the fire-place to the boiler. E is a place to contain the ashes; and F is a door to take them out at, which must be kept closely shut during the time of working. G is the fire place; the fresh fuel is put in at G, and gradually comes down as the fuel below is consumed. The part at H is very hot, being filled with coaks or coals which have ceased to smoke. I is an opening or openings, to admit fresh air to regulate the fire. K is a door into the space under the boiler; and which being opened, admits fresh air to stop the draught of the chimney when the fire is wanted to cease. *Fig. 3* is a plan of the same fire place in the other direction. L L is the brick arch on which the fuel lies; and E is the ash-hole. *Fig. 4* is an outside view of the fire place, shewing the air-holes I I, and the door E; and *fig. 5* is a plan of the furnace part of the boiler seated; taken in the line A A in *fig. 2*. The dotted lines represent the flues, and the darts point out the direction of the current of air. The fire is first kindled upon the brick arch at I; and when well lighted, more fuel is gradually added until it is filled up to G. Care must be taken to leave proper interstices for the air to pass either among the fuel, or between the fuel and the front wall N; and as much air is admitted at I I, as can be done without causing the smoke to ascend perpendicularly. This will always do if too much air is admitted. The dimensions of this fire-place are given by the scale, and are properly adjusted for burning about 84 lb. of coals in an hour; whether more or less quantities are required to be burnt, the furnace must be enlarged or diminished accordingly. much greater, more furnaces than one may be employed. *Fig. 6* represents this new method as applied to a furnace for melting iron and other metals, and constructed without the perpendicular flue D in *fig. 2*. The same letters refer to the same parts in all these figures. Mr Watt also constructs these new fire-places in various other ways; the part G H lies sloping, or horizontal, or otherwise varies the figure or form, and the position of the flues; but in all cases the principle is the same, the fresh or raw fuel being placed next to the external air, and so that the smoke or flame must pass over or through the coaked or charred part of the fuel. He also occasionally covers the opening at E, and causes the air to enter only, or principally, at I I. In particular cases, he places the fuel on a grate as usual, as at A A *fig. 7*, and that grate, or near at the place where the smoke passes into the flues or chimneys, he places another smaller grate B, on which he burns the fire of charcoal, coaks, or coals, which have been previously burnt until they have ceased to

by giving intense heat and admitting some, consumes the smoke of the first fire. He states his new invention to consist only of a method of consuming the smoke, and in the heat, by causing the smoke and flame of fresh fuel to pass through very hot funnels or among, through or near, fuel, which is hot, and which has ceased to smoke; mixing it with fresh air when in these circles; and in the form and nature of the same as above mentioned: the boilers and outlets of the furnaces being such as are in use. These new invented fire places are applicable to furnaces for almost every other

FURNACE, Mr W. THOMPSON'S STEAM-

In vol. iv. of *the Repository* is given the account of a furnace of this sort by Mr Thompson, who describes his invention to be a furnace which will effectually consume the smoke arising from it, without requiring more fuel than usual, as has been the case with former furnaces for that purpose. It may be adapted to any boiler or copper already set up, and at small expence. *Fig. 8*, is a section of an oiler and fire-place. *a a a a*, The brick which boilers are usually set. *A A*, The two iron flues run through this boiler, go round it. *B B*, The fire-place; which is about $\frac{1}{4}$ longer than they are generally. *C*, An arch, which runs across the fire-place, lower than the bottom of the flue under the boiler, and about the middle of the fire-place. *D*, Flues through which the hot air ascends and spends its heat upon the boiler. *E*, A shutter of the fire-place; which must have a hole in it. Thro' this shutter the coals are gently stirred up, by the slice or poker, care not to injure the arch, nor to raise too great a quantity of coals at once. *F* is a small hole behind the fire for a current of air to pass through, as in the patent lamps. *G*, A plate fixed with its whole length across the fire-place, to hinder the coals from falling down the flue and choking it. *Fig. 9*, is a front view of the boiler and fire-place, in which the letters represent the same parts. *H H* are two slides one shifting backwards, the other forwards to make the space *F*, for the current of air more or smaller, as by practice may be found the best manner in which this furnace operates. The arch *C* hinders the smoke from going down the chimney, and obliges it to pass through the flues behind it; which has a very strong effect, and burns the smoke as it passes through the flues, and gives vigour to the flame, which consumes the smoke that may be left. Too much air will have a very bad effect, as it will cool the flame; the slides *H H* must be regulated in such a manner as the operator may find most advantageous. The shutter in the door *E* must also be of a proper size; as its being too large or too small is prejudicial.

FURNACE, PORTABLE. See CHEMISTRY,

FURNACE, REFINING, a furnace for refining metals. See METALLURGY, and REFIN-

ING. *Fig. 1*. *Plate CLX*, represents a longitudinal section of this furnace. 1, 1, The masonry of the pillars and walls surrounding the furnace. 2. The channels for carrying off the moisture. 3. Other small channels which join in the middle of the basin. 4. The basin made of bricks. 5. A bed of ashes. 6. The hollow or basin in which the metal is melted and refined. 7. The great flame hole. 8, 8. The two openings for the entry of the tuyeres of the bellows. 9. The vault or dome of the furnace. 10. The fire-place. 11. The grate. 12. The draught-hole. 13. A hole in the vault, which, being opened, serves to cool the furnace.

(14.) FURNACE, REVERBERATORY, FOR DISTILLING. See CHEMISTRY, p. 338, 341.

(15.) FURNACE, REVERBERATORY, FOR SMELTING ORES. See METALLURGY.—*Fig. 2*. *Plate CLX*, represents a longitudinal section of this furnace. 1. The masonry. 2. The ash-hole. 3. A channel for the evaporation of the moisture. 4. The grate. 5. The fire-place. 6. The inner part of the furnace. 7. A basin formed of sand. 8. The cavity where the melted metal is. 9. A hole through which the scoria is to be removed. 10. The passage of the flame and smoke, or the lower part of the chimney; which is to be carried up to a height of about 30 feet. 11. A hole in the roof, through which the ore is thrown into the furnace. This furnace is 18 feet long, 12 feet broad, and 9½ high.

(16.) FURNACES, MACHINES FOR BLOWING AIR INTO. The most ancient method of animating large fires in the furnaces where ores were melted, seems to have been by exposing them to the wind. Such was the practice of the Peruvians before the arrival of the Spaniards. Alonso Barba relates, that their furnaces, called *guairas*, were built on eminences where the air was freest; that they were perforated on all sides with holes, thro' which the air was driven in when the wind blew, which was the only time when the work could be carried on; that under each hole was made a projection of the stone-work, on which were laid burning coals, to heat the air before it entered the furnace. Some authors speak of several thousands of these guairas burning at once on the sides and tops of the hills of Potosi; and several remains of this practice are to be found in different parts of Great Britain. This method of supplying air being found excessively ineffectual and precarious, the instruments called BELLOWS succeeded. These were at first worked by the strength of men; but as this was found to be very laborious and expensive, the force of running water was employed to give motion to these machines. Thus a much greater quantity of metal could be procured than formerly, and the separation was likewise more complete; inasmuch that in many places the flags or cinders, from which the iron had formerly been extracted, were again used as fresh ore, and yielded plenty of metal. But though this method was found preferable to the others, yet great improvements were still wanted. To melt very large quantities of ore at a time, it was necessary to use bellows of an immense size; and in proportion to their size, they stood in need of the more frequent and expensive repairs. The oil, also, which the bellows required in large quantity, becoming rancid, was

found

found to generate a kind of inflammable vapour, which sometimes burst the bellows with explosion, and thus rendered them totally useless. A new method, therefore, of blowing up fires altogether free from the above mentioned inconveniences was fallen upon by means of water. It depends on the following principle, viz. That a stream of water, running through a pipe, if by any means it is mixed with air at its entrance into the pipe, will carry that air along with it, and part with it again as soon as it comes out of the pipe; and if the air is then collected by a proper apparatus, it may with success be used for exciting the most violent degrees of heat. Machines of this kind are called **WATER BELLOWS**, and are represented on *Plate CLX, fig. 3*. In the right-hand machine, **AB** represents a stream of water falling into the funnel, whose throat is contracted at **B**; after which the stream runs through the perpendicular pipe **EF**, in the upper part of which there are some small holes represented by *cdef*. Through these holes the air has access to mix itself with the descending water, which, being dashed against the sides of the pipe, is reduced to froth, and thus fills the whole cavity of the pipe **EF**, which is considerably larger than the throat of the funnel **B**. When this frothy stream enters the vessel **C**, the air extracts itself from the water; and as it cannot return through the pipe **EF**, because it is continually filled with a stream of liquid water, it flies off with considerable force through the smaller pipe **D**, by which it is conveyed to the furnace. The principal thing, to be kept in view in the construction of these machines, is, to mix the descending stream of water, with as great a quantity of air as possible. For this purpose the contrivance represented in the left-hand machine answers much better than the former. By this the water descending from the reservoir **A** falls into a kind of cullender **B**, perforated with a great number of holes in its sides. Thus the water, being forced out in a number of small streams, is very effectually dashed against the sides of the wide descending pipe, when it enters the condensing vessel **C**, and is sent off by the pipe **D**, as in the former. In some machines of this kind the constructors seem to have been of opinion, that a great height was required in the water-fall; but Dr Lewis who has made a great number of experiments upon the subject, shows, that an excess in height can never make up for a deficiency in the quantity of the water. Four or five feet, he thinks, is a sufficient height for the water-fall; where there is a greater height, however, it may be rendered useful, by joining two or more machines together in the manner represented in the plate; where the water, after having once emitted its air in the condensing vessel **C**, flows out into a new reservoir **E**. From thence it descends through another cullender **F**, and descending from it into a condensing vessel **G**, the air is extricated, and carried off through the pipe **H**. The upper figure, **I**, represents the cullender with the shapes of the holes and their proportional distances according to Dr Lewis. Thus, with very little expence, where there is a sufficient quantity of water, as strong a blast of air as can be desired may be readily obtained; for several machines may be con-

structed, and joined together in a manner what similar to that above mentioned, in which a quantity of water is employed. But, in this method the air is loaded with moisture, in order to make the condensing vessel as high as conveniently may be, that the air may arrive at the furnace in as dry a state as possible. Slender pipes in the left hand machine, a gage filled with mercury or water, the strength of the blast may be determined. In the large iron founderies another method for blowing up the fires by means of a pump. These consist of cast iron cylinders about 3 feet diameter, exactly fitted with a piston moved up and down by means of a water pump. In the bottom of the cylinder is a large valve that of bellows, which rises as the piston goes up, and thus admits the air into the cylinder from below. Immediately above the bottom is a tube which goes to the furnace, as it proceeds from the cylinder is furnished with a valve opening outward. Thus, when the piston is drawn up, the valve in the bottom opens and admits the air that way into the cylinder, while the lateral valve shuts, and prevents the air from getting into it through the pipe. When the piston is thrust down, the valve in the bottom shuts, while the air being compressed in the cylinder is violently forced out through the lateral tube into the furnace. In the foundery at Carron, four of these large cylinders were a few years ago employed at their furnace, and so contrived that the strokes of the pistons, being made alternately, produced a most uninterrupted blast. Some little noise might indeed be perceived by the ear, but too trifling to produce any sensible effect upon the heat of the furnace. Even this could be prevented by means of a large reservoir into which all the four cylinders might discharge. This should be furnished with an heavy piston, whose weight, being supported by the cylinder alone, would force it out through the lateral tube in a manner perfectly equable, and without any of that puffing or interruption in the blast which is perceptible though but in a small degree in the other.

of darkening or obscuring. *Dist.*

FUSE, or **FUZE**, in artillery. See **FUSIL**, § 1. 5.

(1.) * **To FUSE**. *v. a.* [*fundo*, *fusum*, Lat.] To
melt; to put into fusion; to liquify by heat.

(2.) * **To FUSE**. *v. n.* To be melted; to be
capable of being liquefied by heat.

(1.) * **FUSEE**. *n. f.* [*fusée*, French.] 1. The

cone round which is wound the cord or chain of

a clock or watch.—The reason of the motion of

the balance is by the motion of the next wheel,

and that by the motion of the next, and that by

the motion of the *fusée*, and that by the motion

of the spring: the whole frame of the watch car-

ries a reasonableness in it, the passive impression

of the intellectual idea that was in the artist.

Hale's Origin of Mankind. 2. A firelock [from *fu-*

fil, Fr.]; a small neat mu'quet. This is more

properly written *fusil*.

(2.) **FUSEE**, § 1. *def.* 1. See **CLOCK**, § 3, and
WATCH.

(3.) **FUSER**, § 1. *def.* 2. See **MUSKET**.

(4.) * **FUSEE**. Track of a buck. *Ainsl.*

(5.) * **FUSEE OF A BOMB OR GRENADO SHELL**,

is that which makes the whole powder or compo-

sition in the shell take fire, to do the designed ex-

ecution. 'Tis usually a wooden pipe or tap, fill-

ed with wildfire, or some such matter; and is in-

tended to burn no longer than is the time of the

motion of the bomb from the mouth of the mor-

tar to the place where it is to fall, which time An-

derson makes 27 seconds. *Harris.*

(6.) **FUSEES OF BOMBS OR GRENADOES**, are

chiefly made of very dry beech-wood, and some-

times of hornbeam, taken near the root. They

are turned rough, and bored, and then kept for

several years in a dry place; the diameter of the

hole is about $\frac{1}{4}$ th of an inch; the hole does not

come quite through, leaving about $\frac{1}{2}$ th of an inch

at the bottom; and the head is made hollow, in

the form of a bowl. The composition for fuses

is saltpetre 3 parts, sulphur 1, and mealed pow-

der 3, 4, and sometimes 5. This composition is

driven in with an iron driver (whose ends are

capped with copper to prevent the composition

from taking fire), and pressed as hard as possible;

the last shovel-full being all mealed powder, and

two stands of quickmatch laid across each other

being driven in with it, the ends of which are fold-

ed up into the hollow top, and a cap of parch-

ment tied over it till it be used. When these fu-

zes are driven into the loaded shell, the lower end

is cut off in a slope, so that the composition may

inflame the powder in the shell. The fuse must

have such a length as to continue burning all the

time the shell is in its range, and to set fire to the

powder as soon as it touches the ground, which

instantly bursts into many pieces. When the dis-

tance of the battery from the object is known, the

time of the shell's flight may be computed to a

second or two; which being known, the fuse

may be cut accordingly, by burning two or three.

and making use of a watch, or string by way of pendulum, to vibrate seconds.

(1.) * FUSIBILITY. *n. f.* [from *fusible*.] Capacity of being melted; quality of growing liquid by heat.—The ancients observing in that material a kind of metallical nature, or at least a *fusibility*, seem to have resolved it into a nobler use. *Wotton's Architecture*.—The bodies of most use, that are sought for out of the depths of the earth, are the metals, which are distinguished from other bodies by their weight, *fusibility*, and malleableness. *Locke*.

(2.) The FUSIBILITY of gold is greater than that of iron or copper; but less than that of silver, tin, and lead. Borax is frequently mixed with metals, to render them more fusible.

* FUSIBLE. *adj.* [from *fuse*.] Capable of being melted; capable of being made liquid by heat.—Colours afforded by metalline bodies, either colliquate with, or otherwise penetrate into other bodies, especially *fusible* ones. *Boyle*.

FUSIGNANO, a market town of the Cisalpine republic, in the department of the Lower Po, and ci-devant duchy of Ferrara.

(1.) * FUSIL. *adj.* [*fusile*, Fr. *fusilis*, Latin.] 1. Capable of being melted; liquifiable by heat.—Some, less skilful, fancy these scapi that occur in most of the large Gothick buildings of England are artificial; and will have it, that they are a kind of *fusil* marble. *Woodward*. 2. Running by the force of heat.—

The liquid ore he drain'd
Into fit molds prepar'd; from which he form'd
First his own tools: then, what might else be
wrought

Fusile or grav'n in metal. *Milton's Paradise Lost*.
Perpetual flames,

O'er sand and ashes, and the stubborn flint,
Prevailing, turn into a *fusil* sea. *Philips*.

(2.) * FUSIL. *n. f.* [*fusil*, French.] 1. A fire-lock; a small neat musquet. 2. [In heraldry; from *fusus*, Latin.] Something like a spindle.—*Fusils* must be made long, and small in the middle, in the ancient coat of Montague, argent three *fusils* in fesse gules. *Peacock*.

(3.) FUSIL, in heraldry, a bearing of a rhomboid figure, longer than the lozenge, and having its upper and lower angles more acute and sharp than the other two in the middle. It is called in Latin *fusus*, “a spindle,” from its shape.

(1.) * FUSILIER. *n. f.* [from *fusil*.] A soldier armed with a fusil; a musketeer.

(2.) FUSILIERS, FUSILEERS, or FUZILEERS, are armed as the rest of the infantry, but wear caps like the grenadiers, though somewhat shorter. There are 3 royal regiments of fusiliers in the British service: viz. those of the Scotch fusiliers raised in 1678; of English fusiliers; in 1685; and of Welsh fusiliers, in 1688-9.

FUSINE, a village of Maritime Austria, in the late Dogado of Venice, and district of Chioggia, on the Canal of Brenta.

(1.) * FUSION. *n. f.* [*fusio*, Lat. *fusio*, Fr.] 1. The act of melting. 2. The state of being melted, or of running with heat.—Metals in *fusion* do not flame for want of a copious fume, expeller, which fumes copiously, and thereby *ca.* *Newton's Optics*.

(2.) FUSION. See CHEMISTRY, 1 FLUIDITY.

* FUSS. *n. f.* [A low cant word.] a bustle.—

End as it befits your station;
Come to use and application;
Nor with senates keep a *fuss*:
I submit, and answer thus.

(1.) FUST, or FAUSTUS, a goldsmith and one of the 3 earliest printers, to invention of this most useful art has been. Some say, he only assisted Guttenberg, in his attempts to make moveable type. Be that as it may, he had the conceal his art; and to this we are in the tradition of *The Devil and Dr Faust*, ed down to the present times. Fust, in ship with Peter Schoeffer, having, in 1469, ed off a considerable number of copies of the Bible, to imitate those which were sold in the East, he undertook the sale of them at Paris, where the art of printing was then unknown. He sold his copies for so high a sum as 5 crowns, the prices usually demanded by scribes. He afterwards lowered his price to 3 crowns, which created universal astonishment; but when he produced copies as fast as wanted, and lowered the price to 30 c, Paris was agitated. The uniformity of increased the wonder; informations were sent the police against him as a magician; he was searched; and a great number of copies found, they were seized: the red ink, which they were embellished, was said to be his; he was seriously adjudged that he was in league with the devil; and if he had not fled, most probably would have shared the fate of those wretched and superstitious judges condemn him to days for witchcraft. See PRINTING. *kins*, in his *Biographical and Historical Dictionary*, lately published, says “this story is a fable;” and assigns no authority for discrediting it. He is said to have died of the plague at Paris, about 1474.

(2.) * FUST. *n. f.* [*fuste*, Fr.] 1. The trunk or body of a column. 2. [From *fus*.] A strong smell, as that of a mouldy barrel. * To FUST. *v. n.* [from the noun.] to smell ill.

(1.) * FUSTIAN. *adj.* [from the noun.] Made of fustian. 2. Swelling; unnatural; ridiculously tumid. Used of style.

When men argue, th' greatest
O' th' contest falls on terms of art,
Until the *fustian* stuff be spent,
And then they fall to th' argument.
—Virgil, if he could have seen the first
the Sylva, would have thought Statius
his *fustian* description of the statue on
horse. *Dryden's Dufresnoy*.

(2.) * FUSTIAN. *n. f.* [*futaine*, Fr. *fuste*, a tree, because cotton grows on it.] A kind of cloth made of linen and cotton, perhaps now of cotton only.—Is the house trimm'd, the serving men in *fustian* and their white stockings? Such a high swelling kind of writing made up of numerous parts, or of words and ideas, without substance; bombast.—

will you raise me in combustion,
t of high heroick *fustian*. *Hudibras*.
fustian have I heard these gentlemen find
Mr Cowley's odes! In general, I will
nothing can appear more beautiful to
the strength of those images they con-
ry.
fustian is thoughts and words ill
without the least relation to each other.

see thoughts, when govern'd by the close,
to *fustian*, or descend to prose. *Smith*.
STIAN, in commerce, (§ 1, *def.* 1.) is a
otton stuff, which seems as if it were
n one side. Fustians should be altogether
otton yarn, both woof and warp; but
ces are made, the warp of which is flax,
mp. Fustians are made of various kinds,
row, fine, coarse; with shag or nap,
ut it.

FUSTIC. *n. f.* A sort of wood brought
West India, used in dying of cloth. *Dist*.
STIC, or FUSTOCK, is a yellow wood,
s in all the Caribbee islands. It pays no
portation. It is a species of MORUS.

FUSTIGATE. *v. a.* [*fustigo*, Latin.] To
a stick; to cane. *Dist*.

FUSTIG, in the Roman customs, a pu-
inflicted by beating with a cudgel. This
nt was peculiar to freemen; the slaves
rged with whips.

FUSTILARIAN. *n. f.* [from *fusty*.] A low
stinkard; a scoundrel. A word used
peare only.—Away, you scullion, you
: I'll tickle your catastrophe. *Shak*.

FUSTINESS. *n. f.* [from *fusty*.] Mouldiness;

OCK. See FUSTIC, and MORUS.

FUSTY. *adj.* [from *fust*.] Ill-smelling; moui-
for shall have a great catch, if he knock
r of your brains: he were as good crack
it with no kernel. *Shak*.

fusty plebeians hate thine honours. *Shak*.

large Achilles, at this *fusty* stuff,
his deep chest laughs out a loud applause.

Shak.

.K, a town of Hungary, on the Danube,
Peter-Waradin; 16 miles SSE. of Bacs.

FUTILE. *adj.* [*futile*, Fr. *futiles*, Latin.]
tive; loquacious.—One *futile* person, that
t his glory to tell, will do more hurt than
at know it their duty to conceal. *Bacon*.
g; worthless; of no weight.

FUTILITY. *n. f.* [*futilité*, Fr. from *futile*.]
tiveness; loquacity.—This fable does not
much at the *futility* of women, as at the
nt levity of a prying humour. *L'Esrange*.
gness; want of weight; want of solidity.
g *futility* appears in their signs of the zo-
d their mutual relations and aspects. *Bent*.

FUTOCKS. *n. f.* [corrupted from *foot books*.

The lower timbers that hold the ship

FYPOUR SICAI, a considerable town of
Proper, in the province of Agra, seated
range of hills; the southern boundary of
nse plain, in which hardly a shrub is to
and the soil is almost as fine as hair-pow-
circumstance productive of the most disa-

greeable effects, when the hot winds blow from
the W. Its situation too is unhealthy from the
badness of its water. Yet the country near it is
in tolerable cultivation. It is 42 miles W. of A-
gra. Lon. 77. 45. E. Lat. 27. 0. N.

(1.) * FUTURE. *adj.* [*futurus*, Latin; *futur*,
Fr.] That which will be hereafter; to come:
as, the *future* state.—

Glory they sung to the most High! good will
To *future* men, and in their dwellings peace.

Milton.

He sows the teeth at Pallas's command,
And flings the *future* people from his hand.

Addison's Ovid.

(2.) * FUTURE. *n. f.* [from the adjective.]
Time to come; somewhat to happen hereafter.—

Thy letters have transported me beyond

This ign'rant present time; and I feel now

The *future* in the instant. *Shak. Macbeth*.

—The mind, once jaded by an attempt above its
power, either is disabled for the *future*, or else
checks at any vigorous undertaking ever after.
Locke.

(3.) FUTURE, or FUTURE TENSE, in grammar,
denotes an inflexion of verbs, whereby they de-
note, that a thing will be in some time yet to
come. See GRAMMAR.

* FUTURELY. *adv.* [from *future*.] In time
to come.—This prescience of God, as it is presci-
ence, is not the cause of any thing *futurely* suc-
ceeding; neither doth God's foreknowledge im-
pose any necessity, or bind. *Raleigh*.

* FUTURITION. *n. f.* [from *future*.] The
state of being to be; the condition of being to come
to pass hereafter.—Is it imaginable, that the great
means of the world's redemption should rest only
in the number of possibilities, and hang so loose
in respect to its *futurition*, as to leave the event in
an equal poise, whether ever there should be such
a thing or no? *South*.

* FUTURITY. *n. f.* [from *future*.] 1. Time
to come; events to come.—

Not my service past, nor present sorrows,

Nor purpos'd merit in *futurity*,

Can ransom me.

Shak. Othello.

—I will contrive some way to make it known to
futurity, that I had your lordship for my patron.

Swift. 2. Event to come.—All *futurities* are na-
ked before that All seeing Eye, the sight of which is
no more hindred by distance of time, than the sight
of an angel can be determined by distance of place.
South.—

This, great Amphiaras, lay hid from thee,

Though skill'd in fate and dark *futurity*. *Pope*.

3. The state of being to be; *futurition*.—It may
be well reckoned among the bare possibilities, which
never commence into a *futurity*, it requiring such
a free, sedate and intent mind, as it may be, is
no where found but among the platonical ideas.
Glanville's Scepis.

FUTWALL, a town of Bengal, 9 miles SE. of
Patna.

FUZE, FUSE, or FUSRE. See FUSEE.

FUZEIER, Lewis, a French dramatic author,
and one of the editors of a periodical work, enti-
tled *The Mercury*. His works are written with
spirit. He died in 1752, aged 80.

FUZILEER. See FUSILIER.

FUZIR, a town of Hungary, 12 miles SSE. of Caschau.

* To FUZZ. *v. n.* [without etymology.] To fly out in small particles.

* FUZZBALL. *n. s.* [*fuzz* and *ball*.] A kind of fungus, which, when pressed, bursts and scatters dust in the eyes.

* FY. *interj.* [*fy*, French and Flemish; *φύ*, Greek; *fab*, Latin.] A word of blame and disapprobation.

And *fy* on fortune, mine avowed foe,
Whose wrathful wrecks themselves do now allay.

Spenser.

—*Fy*, my lord, *fy*! a soldier, and afraid? What need we fear who knows it, when none can call our power to account? *Macbeth*.—A bawd, sir, *fy* upon him. *Shak.*—

But *fy*, my wand'ring muse, how thou do'st stray!

Expectance calls thee now another way. *Milton.*

Nay, *fy*, what mean you in this open place?
Unhand me, or, I swear, I'll scratch your face:
Let go, for shame! you make me mad for spite:
My mouth's my own; and if you kiss, I'll bite.

Dryden.

—*Fy*, madam, he cried, we must be past all these gaities. *Tatler.*

FYAL, one of the AZORES. It is well cultivated, and yields corn, garden stuffs, and various fruits. It has several kinds of domesticated European animals: the people are cleanly, diligent, and fairer than those of Madeira. The chief town is Villa de Horta. Lon. 28. 36. W. Lat. 38. 32. N.

FYAN'S TOWN, a town of Ireland, in Meath county, 30 miles from Dublin.

FYEN. See FUNEN.

FYERS, or FYRES, a river of Invernesshire,

which descending from the S. flows into the Ness, 10 miles NE. of Fort Augustus. On it is built a stupendous bridge, on two opposite rocks; the top of the arch being above 100 feet from the level of the water. A little below the bridge is the celebrated *Fall of Fyers*, where a great body of water shoots through a narrow passage between two rocks, and then falls over a vast precipice into the bottom of the chasm, whence foam rises and fills the air like a cloud of smoke.

FYFIELD, 3 English villages: 1. in Berkshire, W. of Abingdon: 2. in Essex, near Ongar: 3. in Wilts, W. of Marlborough.

FYNE, Loch, a great inlet of the sea in Gyleshire, near 40 miles long. It receives a tide on each side of the isle of Arran, which is directly opposite to its entrance.

FYNONVAER, a town in Salop, near Oswestry. FYTTY, John, a celebrated painter, born at Antwerp, about 1625, one of the best artists of his time. He often painted in conjunction with Rubens and Jordaens; and finished the hair of animals and the plumage of fowls with wonderful spirit and exactness.

FYVIE, a parish in Aberdeenshire, 13 miles long and 8 broad, containing about 22,000 acres, of which 8000 are under culture, and 12,000 are covered with wood. The Ythan, and the road from Aberdeen to Banff run thro' it. The air is pure, and the soil kindly, yielding good crops of oats and barley. The population in 1793, stated by the rev. Mr. Mackenzie to Sir J. Sinclair, was 2,194: the decrease in 1755, 334.

FYZABAD, a large and populous city in the doostan Proper, in the territory of Oude; on the Gogra, 80 m. E. of Lucknow, and 500 m. by W. of Calcutta. Lon. 82. 30. E. Lat. 26. 30. N.

G

(1.) * **G** Has two sounds, one from the Greek γ, and the Latin, which is called that of the hard G, because it is formed by a pressure somewhat hard of the fore part of the tongue against the upper gum. This sound G retains before *a, o, u, l, r*; as, *gate, go, gull*. The other sound, called that of the soft G, resembles that of γ, and is commonly, though not always, found before *e, i*; as, *gem, gibbet*. Before *n*, at the end of a word, *g* is commonly melted away; as in the French, from which these words are commonly derived: thus, for *benign, malign, condign*, we pronounce *benine, maline, condine*. It is often silent in the middle of words before *b*; as, *night*. The Saxon G, *g*, seems to have had generally the sound of γ consonant; whence *gate* is by rusticks still pronounced *yate*.

(2.) G is used, 1. as a letter; 2. as an abbreviation; 3. as a musical character; and, 4. it was anciently used as a numeral. I. As a LETTER, G is the 7th of our alphabet, and the 5th consonant. In the alphabets of all the oriental languages, the γ, Phenician, Chaldee, Syriac, Samaritan, and even the Greek, it is the 3d letter. The Persians call it *ghimel* or *gimel*, i. e. camel,

because it resembles the neck of that animal. It bears the same appellation in the Samaritan, Phenician, Chaldee: in the Syriac it is called *mel*, in Arabic *giim*, and in Greek *gamma*. The gamma (γ) of the Greeks is evidently the gimel of the Hebrews or Samaritans. The chief difference between the gamma and gimel consists in this, that the one is turned to the right, the other to the left, according to the different manners of writing and reading which obtained among those nations: though Salmasius and Solinus, vainly attempted to prove that the G was derived from the Greek kappa. It is clear that the Latins borrowed their form of this letter from the Greeks; the Latin G being only a variation of the Greek gamma, γ; as might easily be shown, had our printers all the forms of this letter, which we meet with in the Greek and Latin inscriptions through which it has passed from γ to G. Pliny, lib. ii. cap. *De Litera*, calls G a new letter. His reason is, that the Romans had not introduced it before the first Punic war; as appears from the rostral column erected by C. Duilius, on which we everywhere find a C instead of G. It was Carvilius who first distinguished between these letters.

and invented the figure of the G; as we see by Terentius Scaurus. The C served for G; it being the third letter of the alphabet, as the γ or γ was of the Greek. I found instead of C on several medals: *Num. Imperat.* tom. i. p. 39. M. Beyer has a medal of the *Familia Ogulnia*, where C instead of CAR, which is on those of Augustus. But the C is more frequently seen instead of G; as, AUCUSTALIS CALLAETACINENSIS, &c. for AUGUSTALIS, &c. the pronunciation of those words was not only that the G was ignorantly or neglected by the workmen: as is the case in inscriptions of the eastern empire; where CC, AUCC, are often found for AUG, the northern nations frequently changed C into V or W; as in *Gallus*, *Wallus*; *Gallia*, *Wallia*. &c. For in this instance it cannot be that the French changed the W into G; before they wrote *Gallus* long before *Wallus* is known, as appears from all the ancient and Greek writers. And yet it is true, that the French change the W of their nations, and the V consonant, into *Guillelmus*, William, into *Guillaume*; into *Gulphilas*; *Vasco* into *Gascon*, &c. modern G takes its form from that of C. It is a mute, and cannot be sounded without the help of a vowel. Its hard sound, not as Dr Johnson says above, (§ 1.) "effluve of the fore part of the tongue against the upper gum," but by the reflection of the air against the palate, made by the tongue as it comes out of the throat; which Martians thus, *G spiritus cum palato*; so that G is a hard letter. G often sounds hard before i, &c. and sometimes before e, as *get*, &c. hard in derivatives from words ending in *ing*, *stronger*, &c. and generally before the end of words, as *finger*. G is mute before *gn*, *gnish*, *sign*. Gb has the sound of hard *g* beginning of a word, as *ghostly*; sometimes at the end it is quite silent, as *though*. But in many other words Gb has the sound of *g*, as *rough*, *tough*, &c. and in the word *rough*, by ignorance or inadvertency in spelling, has actually usurped the place of *g*. As an ABBREVIATION, G. stands for *genius*, *gens*, *genius*, &c. G. G. for *geffert*, *gefferunt*, &c. G. C. for *genio ci- casaris*. G. L. for *Gaius libertus*, or *ge- G. V. S.* for *genio urbis sacrum*. G. B. for *bonum*. And G. T. for *genio tutelari*. III. G is the character or mark of the treachery, and from its being placed at the head, being the first sound in Guido's scale, the letter took the name GAMUT. IV. As a number, G was anciently used to denote 400; a dash over it, thus, \overline{G} , for 40,000. G, [ג, Hebrew, i. e. an abomination,] was the name of Ebed, the leader of the conspiracy of the Ammonites against the usurper ABIMELECH, the son of Gideon. See Judges, ix. 26—41. AL. Barent, an eminent Dutch painter, died 1650. He was a disciple of Ph. Wouwerman, and acquired his manner. His landscapes are much esteemed.

GAARDE, a town of Norway, in Aggerhuus, 56 miles NW. of Christiania.

GABALA, a town of Arabia Felix, 64 miles NNE. of Aden.

GABALE, in mythology, a deity worshipped at Heliopolis under the figure of a lion, with a radiant head; and it is thus represented on many medals of Caracalla.

GABARA, or GABBARA, in antiquity, the dead bodies which the Egyptians embalmed, and kept in their houses, especially those of such of their friends as died with the reputation of great piety and holiness, or as martyrs. See EMBALMING, and MUMMY.

* GABARDINE. *n. f.* [*gabardina*, Italian.] A coarse frock; any mean dress—My best way is to creep under his *gabardine*; there is no other shelter hereabouts. *Shakesp. Tempest.*—

You call me misbeliever, cut-throat dog,
And spit upon my Jewish *gabardine*. *Shakesp.*
The knight did straight submit,
And laid his weapons at her feet:
Next he disrob'd his *gabardine*,
And with it did himself resign. *Hudibras.*

GABARET, a town of France, in the dept. of Landes, on the Gelse, 15 miles W. of Condom, and 24 E. of Mont Marian. Dr Brookes and J. Walker place it in the dept. of Gers, and also err in the lat. by a whole degree. Lon. o. 6. E. Lat. 43. 59. N.

GABAROUS BAY, a bay on the E. coast of Cape Breton. Lon. 60. o. W. Lat. 45. 50. N.

GABASELSKI, a town of Russia, in the government of Viborg; 36 miles N. of Serdopol.

* GABBLE. *n. f.* [from the verb.] 1. Inarticulate noise like that of brute animals.—Not to know what we speak one to another, so we seem to know, is to know straight our purpose: though's language, *gabble* enough, and good enough. *Shak.*
2. Loud talk without meaning.—

Forthwith a hideous *gabble* rises loud
Among the builders; each to other calls,
Not understood. *Milt. Par. Lost.*
* To GABBLE. *v. n.* [*gabbare*, Ital. *gabberen*, Dut.] 1. To make an inarticulate noise.—

When thou could'st not, savage,
Shew thine own meaning, but would'st *gabble*
like
A thing most brutish, I endow'd thy purposes
With words that made them known.

Shakesp. Temp.
Flocks of fowl, that when the tempests roar,
With their hoarse *gabbling* seek the silent shore.

Dryden's Æn.
2. To prate loudly without meaning.—Have you no wit, manners, nor honesty, but to *gabble* like tinkers at this time of night? Do you make an alehouse of my lady's house? *Shakesp.*—

Which made some think, when he did *gabble*,
Th' had heard three labourers of Babel. *Hudib.*
Such a rout, and such a rabble,
Run to hear Jack Pudding *gabble*. *Swift.*

* GABBLER. *n. f.* [from *gabble*.] A prater; a chattering fellow.

(1.) * GABEL. *n. f.* [*gabelle*, Fr. *gabello*, Ital. *gafel*, Sax. a tribute.] An excise; a tax.—The *gabels* of Naples are very high on oil, wine, and tobacco. *Addison on Italy.*

(2.) GABEL,

(2.) **GABEL**, [Lat. *Gabella*, *Gabium*, *Gablagium*, *u. e. Feßigal*,] has the same signification among the ancient English writers, that **GABELLE** had in France, before the revolution. It has been variously used, for a rent, custom, service, &c. Where it was a payment for rent, those who paid it were termed **GABLATOIRES**. Formerly when mentioned without any addition, *gabel* signified the tax on salt, though afterwards it was applied to all other taxes. In the ci-devant French customs, the *gabelle*, or tax on salt, is said to have had its rise in 1286, under Philip IV. Philip V. took a double per livre on salt, by an edict in 1312, which he promised to remit when he was delivered from his enemies; which was renewed by Philip VI. in 1345; and the duty was raised to 4 deniers per livre; king John resumed it in 1355, and it was granted to the dauphin in 1358, to ransom king John. It was continued by Charles V. in 1366; after his decease, it was suppressed, but revived again by Charles VI. in 1382. Louis XI. raised it to 12 deniers per livre; and Francis I. in 1542, to 24 livres per muid. It was afterwards so greatly augmented that it was estimated to constitute $\frac{1}{4}$ of the whole revenue of the kingdom; so that a minot of salt at last paid a duty of 52 livres, 8 sols, and 6 deniers. Philip VI. first established granaries and officers of the gabelles, and prohibited all others from selling salt. From that period, the commerce of salt for inland consumption continued wholly in the king's hands, every grain of it being sold by his farmers. This very odious and oppressive tax was early abolished by the National Assembly.

(3.) **GABEL**, in geography, a town of Bohemia, in the circle of Boleslaw, 45 miles N. of Prague.

GABELLE. See **GABEL**, § 1, 2.

GABERSTORF, a town of Germany, in Stiria, 10 miles WSW. of Gnaa.

GABIAN, a village of France in the dept. of Herault, 7 miles NW. of Pezenas. It has a mineral spring, near which petroleum issues from a rock.

GABIANO, a village of the Cisalpine republic, in the dept. of Mela, and ci-devant province of Brescia.

GABII, in ancient geography, a town of Latium, midway almost between Rome and Preneste to the E. often mentioned in the history of Tarquin I. It is now extinct.

GABIN, a town of Poland, in the Palatinate of Rawa, 40 miles W. of Warsaw.

GABINIAN LAWS, in Roman antiquity, laws instituted upon several occasions by persons of the name of *Gabinus*: 1. *Gabinia-lex de Comitibus*, by A. Gabinus the tribune, A. U. C. 614; requiring that in the public assemblies for electing magistrates, the votes should be given by tables, and not *viva voce*: 2. *De Comitibus*, which made it a capital punishment to convene any clandestine assembly, agreeable to the old law of the 12 tables: 3. *De Militia*, by A. Gabinus the tribune, A. U. C. 685. It granted Pompey the power of carrying on the war against the pirates, during 3 years, and of obliging all kings, governors, and states, to supply him with all the necessaries he wanted, over the Mediterranean sea, and in the maritime as far as 400 *stadia* from the sea: 4. *De*

Usura by Aul. Gabinus the tribune, A. U. C. ordaining that no action should be granted for recovery of any money borrowed upon interest to be lent upon larger. This was a practice at Rome, which obtained the name *versuram facere*: 5. Against fornication.

GABINUS CINCTUS, in Roman antiquity, a particular way of tucking the gown, by drawing it forwards on the breast, and tying it into a knot, as the people of **GABII** did at a solemn festival on the sudden attack of an enemy, in order to be fitter for action. In this manner they were used to declare war, to sacrifice, and to divide the spoils of the enemy; and then he was said to be *præcinctus*.

(1.) * **GABION**. *n. f.* [French.] A wide basket which is filled with earth to make a fortification or intrenchment.—His battery was defended all along with *gabions*, and casks filled with *Knollas*.

(2.) **GABIONS**, in fortifications, are made of osier twigs, of a cylindrical form, 4 feet high and 4 wide; which, being filled with earth, serve as a shelter from the enemy's fire.

GABISE, a town of Asiatic Turkey, in the circle of 28 miles SE. of Constantinople.

GABLAGIUM. } See **GABEL**, § 2.

GABLATOIRES. }

(1.) * **GABLE**. *n. f.* [*gaval*, Welsh; *Gabel*, French.] The sloping roof of a building, care that all your brick-work be covered with tiling, according to the new way of building, out *gable ends*, which are very heavy, and apt to let the water into the brick-work. See *myer's Husbandry*.

(2.) **GABLE**, or *gable* of a house, is the triangular end from the eaves to the top of the house.

GABLENZ, a town of Upper Saxony, in the circle of Erzgebürg, 6 miles NNW. of Zwickau.

GABOU, or **JABOU**, a country of Africa, between Benin and Dahomy, 150 miles from the sea.

(1.) **GABRES**, or **GAURES**, a religious sect in Persia and India; called also **GAURES**, **GAURES**, **GAURES**, &c. See **MAGI**. Those sect are dispersed through the country, and are supposed to be the remains of the ancient Persians, followers of Zoroaster, being worshippers of fire. They have a suburb at Ispahan, called **GABAD**, or *the town of the Gaurs*, where they are employed in the meanest drudgery: some of them are dispersed through other parts of Persia, they principally abound in Kerman, the most barren province in the whole country, where the hometans allowed them liberty and the exercise of their religion. Several of them fled many years ago into India, and settled about Surat, and their posterity still remain. There is also a great number of them at Bombay. They are ignorant, offensive people, extremely superstitious, and very rigorous in their morals, and very earnest in their dealings. They believe a reformer and a future judgment, and worship only one God. Although they perform their worship before fire, and direct their devotion towards the rising sun, for which they have an extraordinary veneration, yet they strenuously maintain that they worship neither; but that, as these

reflive symbols of the Deity, they turn them in their devotional services. Some ofed, that these are Persians formerly converted to Christianity, who, being afterwards left heathen, mingled their ancient superstitions with the truths and practices of Christianity, and set for themselves a religion apart: and hence, that throughout the whole of their doctrine and practice, we may discern traces of Christianity, though much defaced; as the magi, the massacre of the infant Saviour's miracles, his persecutions, &c.

GABRES is also a name given by the Turks to Christians, signifying *infidels*, or people of another religion; or rather, as Leunclavius observes, *pagans* or *gentiles*; the word *Gabre* among them, has the same signification as *pagan* or *infidel* among Christians, and denoting any thing not Christian.

GAC, a town of France, in the dept. of Ardennes, 12 miles NE. of Rhodéz.

GABRIEL, [גבריאל, Heb. *i. e.* the strength of God,] one of the principal angels in heaven: his name is mentioned in a few events, in which this exalted being is concerned, recorded in scripture. He was the prophet Daniel, to explain to him the vision of the ram and goat, and the mystery of the weeks. He was sent to Zecharias, to declare to him the future birth of John the Baptist; and, months after, to the Virgin Mary, at Nazareth, to warn her of the birth of Jesus Christ. Some commentators call him the *faithful spirit*; and others, by way of metaphor, the *peacock of heaven*. In the 2d chapter of the Koran, it is said, *Whoever is an enemy to Gabriel shall be destroyed*. It was Gabriel, Mahomet pretended, who brought the revelations which he published; and who conducted him to heaven mounted on a winged animal Borak.

GABRIEL, in geography, a mountain of Ireland, in Cork, 12 miles S. of Bantry.

GABRIEL ST. an island of S. America, in the Gulf of Mexico, discovered by S. Cabot, in 1526.

GABRIELITES, in ecclesiastical history, a sect of Baptists that appeared in Pomerania, in 1645, named from Gabriel Scherling; who, after having been for some time tolerated in that country, was obliged to remove, and died in Poland.

GAGLIANICO, a town of France, in the dept. of Orne, 12 miles W. of Aigle, and 13½ E. of Argentan.

GAGLIANICO, a town of France, in the dept. of Eure, 9 miles NE. of Rocheford.

GAD, [גד, Heb. *i. e.* a troop,] one of the twelve tribes, the son of Jacob by Zilpah, and named after the tribe of the Gadites.

GAD, in ancient geography, a district of the kingdom of Bashan on the N. and that of the Ammonites to the S. having the Jordan to the E. and bounded by various nations on the W. so named after the tribe of that name.

GADITES, the tribe of the GADITES.

GAD, a prophet who attended David during his flight from Saul, and gave him various advice afterwards. He wrote a history of David, which is lost.

(5.) **GAD**, in ancient geography, a river in the country of the Gadites, called also Arnon. See **ANNON**.

(6.) * **GAD**. *n. f.* [*gad*, Sax. *gaddur*, Islandick, a club.] 1. A wedge or ingot of steel.—Flemish steel is brought down the Rhine to Dort, and other parts, some in bars, and some in *gads*; and therefore called Flemish steel, and sometimes *gad steel*. *Moxon's Mech. Exerc.* 2. It seems to be used by *Shakespeare* for a stile or graver, [from *gad*, Saxon, a goad.]—

I will go get a leaf of brass,
And with a *gad* of steel will write these words.
Shakespeare.

(7.) **GAD**, among miners, a small punch of iron, with a long wooden handle, used to break up the ore. One of the miners holds this in his hand, directing the point to a proper place, while the other drives it into the vein, by striking it with a sledge-hammer.

* **To GAD**. *v. n.* [Derived by *Skinner* from *gadfly*; by *Junius* from *gadau*, Welsh, to forsake; thought by others only the preterite of the old word *agaan*, to go.] To ramble about without any settled purpose; to rove loosely and idly.

How now, my headstrong, where have you been *gadding*?

—Where I have learnt me to repent. *Shakespeare.*

—Give the water no passage, neither a wicked woman liberty to *gad* abroad. *Ecclef. xxv. 25.*

The lesser devils rose with ghastly rore,
And thronged forth about the world to *gad*;
Each land they filled, river, stream, and shore.

Fairfax.

—Envy is a *gadding* passion, and walketh the streets, and doth not keep at home. *Bacon.*

Gad not abroad at ev'ry quest and call
Of an untrained hope or passion;

To court each place or fortune that doth fall,
Is wantonness in contemplation. *Herbert.*

Thee, shepherd, thee the woods and desert
caves,

With wild thyme and the *gadding* vine o'er-
grown,

And all their echos moan. *Milton.*

A fierce loud buzzing breeze; their stings draw
blood,

And drive the cattle *gadding* thro' the wood.

Dryden.

She wreaks her anger on her rival's head;

With furies frights her from her native home,

And drives her *gadding*, round the world to
roam. *Dryden.*

—There's an ox lost, and this coxcomb runs a
gadding after wild fowl. *L'Estrange.*—No wonder
their thoughts should be perpetually shifting from
what disgusts them, and seeking better entertain-
ment in more pleasing objects, after which they
will unavoidably be *gadding*. *Locke.*

GADARA, in ancient geography, a strong town of the Peræa, in Decapolis, restored by Pompey after its demolition by the Jews. (*Josephus*.) After Herod's death, it was joined to Syria, by Augustus.

GADARENES, the inhabitants of **GADARA**, and the adjacent country. See next article.

GADARENORUM AGER, in ancient geography, the country of the Gadarenæ, called by
Strabo.

Matthew the country of the GERGASENES, a district that lay between Gadara and Gergesa, otherwise called *Gerasa*, both which lay within the Decapolis on the other side Jordan.

GAD-BEE. See GAD-FLY, and OESTRUS, N° 1.

* GADDER. *n. f.* [from *gad*.] A rambler: one that runs much abroad without business.—A drunken woman, and a *gadder* abroad, causeth great anger, and she will not cover her own shame. *Ecclus.* xxvi. 8.

* GADDINGLY. *adv.* [from *gad*.] In a rambling, roving manner.

GADEBUSCH, a town of Germany, in the duchy of Mecklenburg, near which, the Swedes defeated the Danes in 1712. It is 16 miles W. NW. of Schwerin.

GADEMIR, or } a country of Africa, W. of
(1.) GADEMIS, } Fezzan, containing 92 towns and villages.

(2.) GADEMIS, or GADEMIR, the capital of the above country, lies 300 miles from the sea coast. Lon. 11. 0. E. Lat. 31. 30. N.

GADEN, a town of Austria, 10 miles W. of Vienna.

GADERSLEBEN, a town of Saxony, 20 miles E. of Halberstadt

GADES, or GADIRA, in ancient geography, a small island in the Atlantic, on the Spanish coast, 25 miles from the Pillars of Hercules. It was sometimes called TARTESSUS, and *Erythia* according to Piny. Geryon, whom Hercules killed, is said to have resided in it. *Hercules Gaditanus* had there a celebrated temple, in which all his labours were engraved with excellent workmanship.

(1.) * GADFLY. *n. f.* [*gad* and *fly*; but by *Skinner*, who makes it the original of *gad*, it is called *goadfly*. Supposed to be originally from *goad*, in Saxon, *gad* and *fly*.] A fly that when he stings the cattle makes them gad or run madly about; the breec.—The fly called the *gadfly* breedeth of somewhat that swimmeth upon the top of the water, and is most about ponds. *Bacon*.

Light fly his slumbers, if perchance a flight
Of angry *gadflies* fasten on the herd. *Tobias*.

(2.) GAD-FLY. See OESTRUS.

GADIAG, a town of Russia, in the prov. of Tchernigow, 12 miles SE. of Tchernigow.

GADIRA. See GADES.

GADITANI, the people of GADES.

GADITANUS, a surname of Hercules.

GADITES, one of the 12 tribes of Israel, who inhabited the country on the E. side of Jordan. See GAD, N° 2. They amounted to 45,650, when they came out of Egypt, but decreased in the wilderness to 5150. They were carried captives by Tiglath pileser.

GADONA, or } a country of Africa, S. of the
GADUA, } Senegal, containing mines of gold, iron, and nitre. Lon. 8. 0. W. Lat. 13. 30. N.

GADUS, in ichthyology, a genus of fishes belonging to the order of jugulares. The head is *thick*; there are seven cylindrical rays in the *nostril* membrane; the body is oblong, *riduous scales*; the whole fins are covered with *the common skin* of fish: the rays of the

back fins are blunt, and those of the *ventral* sharp. There are 17 species, distinguished by their cirri, and the number of fins. The most remarkable are the following.

1. GADUS BARBATUS, the POUT, grows to a large size, seldom exceeding a fathom. It is distinguished from all others by its depth; one of the size above mentioned is near 4 inches deep in the broadest part. The back is very much arched, and the colour of the fins and tail are black; one of the pectoral fins is a black spot. The lateral line is white, broad, and crooked. It is even at the end, and of a dusky colour. The colour of the body is white; but more so on the back than the belly, and tinged with red. It is called at Scarborough a *kieg*, a delicate fish.

2. GADUS CARBONARIUS, the COALFISH, of a more elegant form than the common cod, generally grow to the length of 2½ feet, and weigh about 28 or 30 lb. at most. The head is small, the under jaw a little longer than the upper. The tail is broad and forked. They vary in colour. Some have their back, nose, dorsal fin, and gill-covers of a deep black; the gill-covers five or six. Others are dusky, others brown; but the lateral line is straight and white, as in the common cod. The ventral and anal fins white. The species takes its name from the black colour it sometimes assumes. *Belon* calls it *gadus carbonarius*, imagining that it was so named by the fishermen from its producing the Ichthyocolla: gives the true etymology. These fish are common on most of our rocky and deep shores, particularly those of the north of Scotland, where they are a great support of the poor. They begin to appear on the Yorkshire coast in the month of July, in vast shoals, and are then a great nuisance. In August they are taken in great numbers with the angling rod; they are esteemed very good when young, but grow so coarse when a year old, that few eat them. Fish of that age are from 8 to 10 inches long, and begin to have a little black on the gills and on the back; this blackness increases as they grow older. The fry is known by its name in different places: they are called at Scarborough *parrs*; and when a year old, *cods*. About 20 years ago such a quantity fished that part, that for several weeks it was possible to dip a pole into the sea without catching any. Though this fish is so little esteemed, it is salted and dried for sale.

3. GADUS ELEGANS, the HADDOCK, has a long body; the upper part of a dusky colour, and the belly and lower part of a white colour. On the back are three fins, the dorsal, the anal, and the tail; the lateral line is white. The head slopes to the nose; on the chin is a short beard; on the side beyond the gills is a large black spot. *Stilton* assigns this mark to the impostor, which he left with his finger and thumb when he took a piece of silver out of the mouth of a fish. This species, which has been continued to

haddock ever since that miracle. Large haddock begin to be in roe in the middle of November and continue so till the end of January; time till May they are very thin-tailed, season. In May they begin to recover; haddock sized fish are then very good, and improving till the time of their perfection. Small ones are extremely good from May to July, and some even in February, March, viz. those which are not old enough to be fished by the fishermen assert; that in rough weather haddock sink down into the sand and ooze from the sea, where they shelter themselves till the storm is over; for in stormy weather they live on young herrings and other small fish in winter on the stone-coated worms, SERPULA, which the fishermen call sandworms. The grand shoal of haddock comes in on the Yorkshire coast. It is remarkable that a shoal appeared in 1766, on the 10th of November and exactly on the same day in 1767: it extended from the shore near 3 miles and in length from Flamborough head to the castle, and perhaps much farther. An idea may be given of their numbers by the following fact: Three fishermen, with the assistance of a mile from Scarborough hastily loaded their boat with them, taking each time about a ton of fish; they put down their lines beyond the distance of five miles from the shore, they caught a great number of dog fish, which shows how exactly they keep their limits. The best haddock sell from 8d. to 1s. per score, the smaller from 4d. and even a halfpenny per score. Haddock quit the coast as soon as they are in high season, and leave behind great quantities of small ones. It is said that they visit the coast of Hamburg and Jutland in summer. It is remarkable than providential, that all kinds of fish (except mackerel) which frequent the Yorkshire coast approach the shore, and as it were live to us, generally remaining there till they are in high season, and retire from us and become unfit for use. It is the custom to sell haddock in the London markets. They do not grow to a great bulk, one of 14 lb. being an average size, but these are extremely coarse; weighing only from 2 to 3 lbs.

GADUS LOTA, the BURBOT, in its body resembles to an eel, only shorter and its motions also resemble those of an eel. They are besides very smooth, slippery. The head is very ugly, being flat, and that of a toad; the teeth are very numerous. On the end of the nose are small beards; on the chin another. The scales are: some are dusky, others are of a yellowish spotted with black, and oftentimes white; and the belly in some is white; but in others are frequently concealed by the scales. This species abounds in the lake of Geneva, met with in the lakes Maggiore and Como. In Britain it is found in the Trent; but plenty in the Witham, and the great Ouse in Lincolnshire. It is a very delicate fish.

PART I.

fish for the table, though of a disgusting appearance when alive. It is very voracious, and preys on the fry and lesser fish. It does not often take bait, but is generally caught in weels. The largest taken in our waters weigh between 2 and 3 lb. but abroad they are sometimes found of double that weight.

(5.) **GADUS MERLANGUS**, the WHITING, is a fish of an elegant make: the upper jaw is the longest; the eyes are large, the nose is sharp: the teeth of the upper jaw are long, and appear above the lower when closed. The colour of the head and back is a pale brown; the lateral line white, and crooked; the belly and sides are silvery, the last streaked lengthwise with yellow. These fish appear in vast shoals in spring, keeping at the distance of about half a mile to that of three from the shore. They are caught in vast numbers by the line, and afford excellent diversion. They are the most delicate, as well as the most wholesome, of any of the genus: but they do not grow to a large size, the biggest not exceeding 20 inches; and even that is very uncommon, the usual length being 10 or 12; though, it is said, that whittings from 4 to 8 lb. in weight have been taken in the deep water at the edge of the Dogger Bank.

(6.) **GADUS MERLUCIUS**, the HAKE, is found in vast abundance on many of our coasts, and those of Ireland. There was formerly a vast stationary fishery of hake on the Nymph Bank off Waterford; immense quantities appearing there twice a-year; the first shoal coming in June, during the mackerel season; the other in September, at the beginning of the herring season, probably in pursuit of those fish: it was usual for six men with hooks and lines to take a 1000 hakes in one night, besides a considerable quantity of other fish. These were salted and sent to Spain, particularly to Bilboa. We know not the present state of this fishery; but Mr Smith, who wrote the history of the county of Waterford in 1746, complains of its decline. Many of the gregarious fish are subject to change their situations, and desert their haunts for numbers of years, and then return. Mr Smith instances the loss of the haddock on the Waterford shores, where they used to swarm; and the capriciousness of the herrings, which so frequently quit their stations, is well known. Sometimes the irregular migration of fish is owing to their being followed and harassed by an unusual number of fish of prey, such as the sharks; sometimes to deficiency of the smaller fish, which served them as food; and lastly, in many places to the custom of trawling, which not only destroys their spawn deposited in the sand, but also destroys or drives into deeper waters numberless worms and insects, the repast of many fish. The hake is in England esteemed a very coarse fish, and is seldom admitted to table either fresh or salted. When cured, it is known by the name of *Poor John*. These fish are from 1½ to near 3 feet long. They are of a slender make, of a pale ash colour on their backs, and of a dirty white on their bellies.

(7.) **GADUS MINUTUS**, the POOR, is the smallest species yet discovered, being little more than 6 inches long. On the chin is a small beard; the eyes are covered with a loose membrane; on each side of the gill-covers and jaws there are 9 pairs of small teeth.

tures. The colour on the back is a light brown; on the belly a dirty white. It is taken near Marseilles, and sometimes in such quantities as to become a nuisance; for no other kinds of fish are taken during their season. It is esteemed good, but incapable of being salted or dried. Beion says, that when it is dried in the sun, it grows as hard as horn. We owe the discovery of this kind in our seas to the Rev. Mr Jago.

(8.) *GADUS MOLVA*, the **LING**, is usually from 3 to 4 feet long, but have been caught 7 feet long. The body is very slender; the head flat: the upper jaw is longest; the teeth in that jaw are small and very numerous; in the lower, few, slender, and sharp: on the chin is a small beard. They vary in colour, some being of an olive hue on the sides and back, others cinereous; the belly white. The ventral fins are white: the dorsal and anal edged with white. The tail is marked near the end with a transverse black bar, and tipped with white. Its English name *ling* is derived from its length, being a corruption of *long*. It abounds about the Scilly Isles, on the coasts of Scarborough, Scotland and Ireland, and forms a great branch of trade. It was considerable so long ago as the reign of Edward III. an act for regulating the price of lob, *ling*, and cod, being made in his 31st year. In the Yorkshire seas they are in perfection from the beginning of Feb. to that of May, and some to the end of it. In June they spawn, depositing their eggs in the soft oozy ground of the mouth of the Tees. At that time the males separate from the females, and resort to some rocky ground near Flamborough Head, where the fishermen take great numbers without ever finding any of the female fish among them. While a ling is in season its liver is very white, and abounds with a fine flavoured oil; but as soon as it goes out of season, the liver becomes as red as that of a bullock, and affords no oil. The same happens to the cod and other fish in a certain degree, but not so remarkably as in the ling. When in perfection, a very large quantity of oil may be melted out of the liver by a slow fire; but if a violent sudden heat be used for that purpose, they yield very little. The oil, which nature hoards up in the cellular membranes of the fishes, returns into their blood, and supports them in the engendering season, when they generate with so much eagerness as to neglect their food. Vast quantities of ling are salted for exportation as well as for home consumption. To be cut or split for curing, it must measure 25 inches or upwards from the shoulder to the tail: if less than that, it is not reckoned a sizeable fish, and consequently not entitled to the bounty on exportation; such are called *drizzles*, and are in season all summer.

(9.) *GADUS MORHUA*, the common cod, is **cinereous** on the back and sides, and commonly **spotted with yellow**: the belly is white; but they vary much, both in colour and shape, particularly **that of the head**. The side line is white, broad, **straight**, till opposite the vent, when it bends **in the tail**. Codlings are often taken of a **orange**, and even red colour, while they **ing the rock**; but on changing their **the colour of other codfish**. The **equal length**, and at the end of the

lower is a small beard; the teeth are the palate as well as in the jaws. found only in the northern seas; being **deletius** calls it, an *ocean fish*, and never in the Mediterranean Sea. It affects cold and seas confined between the latitude 50°; those caught N. and S. of this being either bad, or in small numbers. Greenland cod are small, and emaciated, very voracious, and suffering in those cities of provision. Most other species inhabit the cold seas, or such as lie with that can just claim the title of *temperate* is nevertheless a species found near the Islands, called *cherny*, which, according to some Glais, are better tasted than the land kind. The great rendezvous of this fish is on the banks of Newfoundland, other sand-banks off the coasts of Canada, Nova Scotia, and New England. In those situations, on account of the woody sandy bottoms; and their vicinity to the seas, where they span in full security of food forces them, as soon as the ice is open, to repair thither for subsistence taken N. of Iceland, but on the S. and they abound: they are again found on the coasts of Norway, in the Baltic, Orkney and Western Isles; after which numbers decrease, in proportion as they are farther S. and they are never found in the straits of Gibraltar. Before the discovery of Newfoundland, the greater fisheries of the seas of Iceland, and off our Western coasts, which were the grand resort of ships of commercial nations; but the greatest met with near Iceland. The English thither before 1415: Henry V. was give the king of Denmark satisfaction in irregularities committed on those sea subjects. In the reign of Edward IV. were excluded from the fishery by tax forbidden to resort there, under forfeit of goods. Notwithstanding this, they afterwards allowed a ship of Hull to land, and there relade fish and other goods out regard to any former restrictions. of the English in latter times was far confirmed: for Q. Elizabeth asked for fish in these seas from Christian IV. of Denmark, but afterwards she instructed her ambassador that court to insist on the right of a fishery. In the reign of James I. however, there were fewer than 150 ships employed in the fishery; which indulgence might arise from the king's marriage with princess Anne of Denmark. But the Spanish, the French, and the Dutch had greatly the advantage of the English fisheries at the beginning, as appears from that in the seas of Newfoundland in the number of ships belonging to each nation thus:—Spaniards, 100, besides 200 came from Biscay to take whale for about 5, or 6,000 tons: Portuguese 500 tons: French and Bretons 150, or 200 English, from 30 to 50. The increase that now resort to those fertile banks of Britain enjoys the greatest share; while

treasures, as it brings wealth to individual strength to the state. See FISHERY, All this immense fishery is carried on by and line only. They fish from the depth 60 fathoms, according to the inequality of the bottom, which is represented as a vast mountain of water, above 500 miles long, and near 100 miles wide; and that seamen know when they approach by the great swell of the seas and the storms that impend over it. The bait is her- all fish called a *capelin*, a shell-fish called a *limp*, and bits of sea fowl; and with these are sufficient to find employment for near 100,000 Irish seamen, and to afford subsistence to a more numerous body of people at home who are engaged in the various manufactures so vast a fishery demands. The food of the cod is either small fish, worms, testaceous animals, such as crabs, large whelks, &c. their digestion is so powerful as to digest the greatest part of the shells they swallow. They are very voracious, and catch at any small object they perceive moved by the water, even small pebbles, which are often found in their stomachs.

The fishermen are well acquainted with the air bladder, or sound of the cod; they are very dexterous in perforating this part of the fish with a needle, in order to disengage the air; for without this operation it could not be kept under water in the well boats, and brought fresh to market. The sounds of the cod are a delicacy often brought from New-England.

Ifinglass is also made of this part by the Irish fishermen: a process which deserves notice of the natives of the north of Scotland, where these fish are plentiful. See ICING-GLASS. Providence has kindly ordained, that this fish, so useful to mankind, should be so prolific as to supply more than the deficiencies of the multitudes annually taken. Leeuwenhoek counted 9,384,000 eggs in a cod-fish of a moderate size; a number, sure, that will baffle the efforts of man, or the voracity of the insects of the ocean, to exterminate, and which affords to all ages an inexhaustible supply of food. In our seas they begin to spawn in May, and deposit their eggs in rough crevices among rocks. Some continue in roe till the end of April. They in general recover faster from spawning than any other fish; therefore common to take some good ones all the year.

When out of season, they are thin and flabby; and the lice chiefly fix on the sides of their mouths. The fish of a middling size are most esteemed, and are chosen by their size and roundness, especially near the tail; the absence of the fulcus or pit behind the head; the regular undulated appearance of the scales as if they were ribbed. The glutinous parts of the head lose their delicate flavour, after 24 hours out of the water, even in the best season. One mentioned by Mr Pennant as the largest that he ever heard of taken in Scotland, weighed 78 lb. the length was 5 feet 6 inches, and the girth round the shoulders was taken at Scarborough in 1755, and was 11 ft. But the general weight of these

fish in the Yorkshire seas, he says, from 14 to 40 lb. This species is short in proportion to its bulk, the belly being very large and prominent.

(10.) *GADUS MUSTELA*, the FIVE-BEARDED COD, very much resembles the LOTA. (See N. 4.) The beards on the upper jaw are 4, viz. two at the very end of the nose, and two a little above them: on the end of the lower jaw is a single one. The fish are of a deep olive brown, their belly whitish. They grow to the same size as the lota. The Cornish fishermen are said to whistle, and cry *bod, bod, vean*, when taking this fish, as if by that they facilitated the capture. In the same manner the Sicilian fishermen repeat their *ma-massu di pajanu*, &c. when they are in pursuit of the sword fish.

(11.) *GADUS POLLACHIUS*, the POLLACK, has the under jaw longer than the upper; the head and body rises pretty high, as far as the first dorsal fin. The side line is incurvated, rising towards the middle of the back, then sinking and running straight to the tail; it is broad and of a brown colour. The colour of the back is dusky, sometimes inclining to green: the sides beneath the lateral line are marked with lines of yellow; and the belly is white. This species is common on many of our rocky coasts: during summer they are seen in great shoals frolicking on the surface of the water, and flinging themselves into a thousand forms. They will then bite at any thing that appears on the top of the waves, and are often taken with a goose feather fixed to the hook. They are very strong, being observed to keep their station at the feet of the rocks in the most turbulent and rapid sea. They are good eating. They do not grow to a very large size; the biggest seldom exceed 6 or 7 lb. but some have been taken near Scarborough, during winter, that weighed near 28 pounds. They are there called *leets*.

(12.) *GADUS TORICUS*, the TORSK, *tusk*, or *brismack*, is a northern fish; and as yet not discovered lower than about the Orkneys, and even there it is rather scarce. In the seas about Shetland, it swarms, and forms (barrelled or dried) a considerable article of commerce. The length is about 20 inches, the greatest depth 4½, the head is small; the upper jaw a little longer than the lower; both jaws furnished with many small teeth; on the chin is a small single beard: from the head to the dorsal fin is a deep furrow. The colour of the head is dusky: the back and sides yellow; belly white; edges of the dorsal, anal, and caudal fins, white; the other parts dusky; the pectoral fins brown.

GAELE, a town of France in the dep. of Ille and Vilaine, 1 mile S. of St Maen, and 10 W. of Montfort.

(1.) **GAELIC**, *adj.* belonging to the *Gaels*, *Celts*, or ancient Scots Highlanders.

(2.) **GAELECK LANGUAGE**, the language of the ancient and modern Highlanders of Scotland. See HIGHLANDERS. It is esteemed the most ancient as well as the purest dialect of the Celtic, now spoken. It has all the marks of an original language. Most of its words are expressive of some property or quality in the objects which they denote. This, with the variety of its sounds, (many of which, especially those that express the soft and

aff is, *peculiar to it*, renders it highly adapted to poetry. It was the language of the Scottish Court, till the reign of Malcolm Canmore, and was even spoken so late as that of Robert Bruce, particularly in a parliament held by him at Airdchattan. Its alphabet consists of 18 letters, of which 5 are vowels. "Those who understand it, (says the rev. Dr James Robertson, of Callander,) know its energy and power; the ease with which it is compounded; the boldness of its figures; its majesty in addressing the Deity, and its tenderness in expressing the finest feelings of the human heart. But its genius and constitution, the structure of its nouns and verbs, and the affinity it has to some other languages are not so much attended to. These point at a very remote era, and seem to deduce its origin from a very high antiquity. The verbs have only 3 tenses, which is the simplest and most natural division of time. The persons of each tense are distinguished, by adding pronominal particles to each person. The 3d person singular of each verb has genders, or admits of a masculine and feminine participle affixed. The moods are the indicative, imperative and infinitive. The subjunctive differs from the indicative only by the addition of one syllable to the verb, and a conjunction before it. The imperative has only the second person in both numbers. The infinitive is often used as a substantive noun, expressive of the abstract signification of the verb. There is only one conjugation, and one declension. The cases of the nouns are marked by different particles, or by a change of the last vowel. The degrees of comparison are formed by placing certain syllables before the adjective; and the superlative frequently by a repetition of the positive." These and many other peculiarities of the Gaelic language are mentioned by Dr Robertson, and illustrated by numerous examples, in *Sir J. Sinclair's Stat. Account*, Vol. XI. p. 611—619; to which we must refer the reader who wishes for farther information respecting this ancient language; which, the Dr says, has "a very striking affinity to the Eastern languages."

the feet as the pike is under water is
er's gage.

is, *AGYPSO-MERCURIAL*, an apparatus
by Dr Hales, and applied in various
branches of trees, to determine the
which they imbibe moisture. In *Plate*
3. a, is a cylindric glass, e. g. of an
in within, and 8 inches long. Into this
induced the branch of a young thriving
tree, about 3 feet long, with lateral bran-
diameter of the transverse cut being
of an inch. Having fitted the joint *r*
at *r*, by folding a piece of sheep's skin
down, it is cemented with a mixture of
red turpentine melted together, in such
as to make a very stiff clammy paste

when cold, and over the cement folds of wet blad-
ders are bound firmly with pack-thread. To the
lower end *r* of the large tube, a smaller tube *s*
is cemented, being about $\frac{1}{2}$ of an inch diameter,
and 18 inches long, and in substance full $\frac{1}{4}$ of an
inch thick. These tubes are cemented together at
a, with common hard brick-dust, or powdered
chalk cement, and the joint is farther secured with
the cement of bees wax and turpentine, over which
a wet bladder is bound. The apparatus being
thus prepared, the branch is turned downwards,
and the glass tube upwards, and then both tubes
are filled with water; with the finger applied to
the open end of the small tube, it is inverted and
immersed in the glass cistern *x*, full of mercury
and water. In this situation the lower end of the
branch was immersed 6 inches in water, viz. from
r to *i*; the water was imbibed by the branch at
its transverse cut *i*; and during its ascent into the
sap-vessels of the branch, the mercury rose in the
tube *s* from the cistern *x*, so that in half an
hour it was risen $5\frac{1}{2}$ inches high, as far as *n*.
The height of the mercury indicated, in some
measure, the force with which the sap was im-
bibed, though not the whole force; because, while
the water was imbibed by the branch, its trans-
verse cut was covered with innumerable little he-
mispheres of air, and many air-bubbles issued out
of the sap vessels, which partly filled the tube *s*,
as the water was drawn out of it: and therefore
the height of the mercury could only be propor-
tionable to the excess of the quantity of water
drawn off, above the quantity of the air which
issued out of the wood. If the quantity of air is-
suing from the wood had been equal to the quan-
tity of water imbibed, it is plain that the mercury
could not rise at all, because there would be no
room for it in the tube: but if 9 parts in 12 of the
water be imbibed by the branch, and only 3 such
parts of air issue into the tube in the same time,
the mercury must rise near 6 inches, and so pro-
portionably in other cases. Dr Hales observed,
that the mercury rose highest, in most cases, when
the sun was clear and warm, and that it subsided
3 or 4 inches towards evening, but rose again the
next day as it grew warm, though seldom so high
as at first. He adapted the size and shape of the
glass apparatus to a great variety of branches of
several sizes and of different kinds of trees, and re-
peated the experiment above described, *mutatis*
mutandis, in a variety of instances. See his *Vege-*
table Statics, vol. i. chap. ii. p. 84, &c.

(3) *GAGE*, *SUCKER* &c., an instrument contri-
ved by Dr Hales to find the different degrees of
coolness and saltness of the sea, at different depths.
It consists of a common household pail or bucket,
with two heads; which have each a round hole in
the middle, about 4 inches in diameter, covered
with square valves opening upward; and that they
may both open and shut together, there is a small
iron rod fixed to the upper part of the lower valve,
and the other end to the lower side of the upper
valve. So that as the bucket descends with its
sinking weight into the sea, both the valves may
open by the force of the water, which thus has a
free passage through the bucket. But when the
bucket is drawn up, then both the valves shut by
the force of the water at the upper part of the
bucket

bucket; so that the bucket is drawn up full of the lowest sea water to which it has descended. When the bucket is drawn up, the mercurial thermometer fixed in it is examined; but great care must be taken to observe the degree at which the mercury stands, before the lower part of the thermometer is taken out of the water in the bucket, lest it be affected by the different temperature of the air. To keep the bucket in a right position, there are 4 cords fixed to it, reaching about 3 feet below it; to which the sinking weight is fixed. The result of several trials with this gage was, that when it was let down to different depths, from 360 feet to 5,346 feet, in lat. 25. 13. N. and lon. 25. 12. W. it was discovered by the thermometer, that the cold increased gradually in proportion to the depths, till it descended to 3,900 feet, viz. near three-fourths of a mile, whence the mercury in the thermometer came up at 53° ; and though it afterwards sunk to 5,346 feet, i. e. a mile and 66 feet, it came up no lower: the warmth of the water upon the surface, and that of the air, was all that time 84° . When the water in the bucket was become of the same temperature with that on the surface of the sea, equal quantities of both were weighed and tried by the hydrometer; that from below was found to be the heaviest, and consequently the saltest. Dr Hales was probably led to the construction of this sea-gage from an instrument invented by Dr Hook, and designed for the same purpose. See *Plate CLX, fig. 2*. This consists of a square wooden bucket C, whose bottoms are so contrived, that as the weight A sinks the iron B, to which the bucket C is fastened by two handles D, D, on the end of which are the moveable bottoms or valves E E, and thereby draws down the bucket, the resistance of the water keeps up the bucket in the posture C, whereby the water, whilst the bucket is descending, hath a free passage through it; whereas, as soon as the bucket is pulled upwards by the line F, the resistance of the water to that motion beats the bucket downwards, and keeps it in the posture G, whereby the included water is kept from getting out, and the ambient water kept from getting in. *Phil. Transf.* N^o 9, p. 149. and N^o 24, p. 447. or abr. vol. ii. p. 260

(9.) GAGE, SEA, an instrument invented by Dr Hales and Dr Desaguliers for finding the depth of the sea; the description whereof is this: AB, *Plate CLXI, fig. 3*, is the gage-bottle, in which is cemented the gage-tube Ff in the brass cap at G. The upper end of the tube F is hermetically sealed, and the open lower end f is immersed in mercury, marked C, on which swims a small thickness or surface of treacle. On the top of the bottle is screwed a tube of brass HG, pierced with several holes to admit the water into the bottle AB. The body K is a weight hanging by its shank L, in a socket N, with a notch on one side at m, in which is fixed the catch / of the spring S, and, passing through the hole L, in the shank of the weight K, prevents its falling out when once hung on. On the top, in the upper part of the brass tube at H, is fixed a large empty ball, or full blown bladder J, which must not be so large, but that the weight K may be able to sink the whole under water. *The instrument thus constructed is used in the fol-*

lowing manner. The weight K being the gage is let fall into deep water, to the bottom: the socket N is somewhat than the shank L; and therefore, after K comes to the bottom, the gage will descend till the lower part of the socket gainst the weight; this gives liberty to fly out of the hole L, and let go the when this is done, the ball or bladder buoys up the gage to the top of the water: the gage is under water, the water has access to the treacle and mercury in the tube by its pressure force it up into the tube to the height to which it has been for greatest pressure, viz. that at the bottom shown by the mark in the tube which leaves behind it, and which is the only treacle. This shows into what space air in the tube Ff is compressed; and by the height or depth of the water weight produced that compression, nothing required. If the gage-tube Ff a scale might be drawn on it with the diamond, showing, by inspection, what water stands above the bottom. But of 10 inches is not sufficient for fathoms at sea, since that, when all the air in the tube is compressed into half an inch of water is no more than 634 feet, or half a quarter of a mile. If, to remedy make use of a tube 50 inches long, strength may be a musket-barrel, and air compressed into 100th part of its bulk, then by saying, as 1 : 99 :: 400 : 39600, 3300 feet; even this is but little more than a mile, or 2640 feet. But since it is not to suppose the cavities of the sea bear relation to the mountainous parts of the land which are more than 3 miles above the surface; therefore, to explore such great depths, Doctor contrived a new form for his gage rather for the gage tube in it, as follows. *fig. 4*, is a hollow metalline globe connected on the top with a long tube AB, which is a 9th part of that globe. On the lower end D, it has also a short tube DE, to receive mercury and treacle. The air contained in the compound gage-tube is compressed as before; but the degree of compression to which the treacle has been forced, can be seen through the tube; therefore that end, a slender rod of metal or wood with a knob on the top of the tube AB, will mark of the treacle, and show it when it is at the bottom. If the tube AB be 50 inches long, and bore that every inch in length should contain an inch of air, and the contents of the globe together 500 cubic inches; then when compressed within 100th part of the original space, evident the treacle will not approach more than 5 inches of the top of the tube, which to the depth of 3300 feet of water as above, at this depth will compress the air into a space nearly, viz. $2\frac{1}{2}$ inches, which contains 6600. which is a mile and a quarter. If that space, or $1\frac{1}{4}$ inch, will show down to the depth, viz. 13200 feet, or $2\frac{1}{2}$ miles, probably very nearly the greatest depth

GE, SLIDING, a tool used by mathematicians for measuring and setting.

GE, TIDE, is the name of an instrument terminating the height of the tides by M. de la Hire's course of a voyage towards the south in the Resolution and Adventure, in 1774, and 1775. This instrument consists of a tube, whose internal diameter was $\frac{1}{8}$ of an inch, lashed fast to a ten-foot pole into feet, inches, and quarters: this pole was fastened to a strong post fixed upright and full of water. At the lower end of the tube was a small aperture, through which the tide was admitted. In consequence of this, the surface of the water in the tube was affected by the agitation of the sea, and the height was not altered one roth of an inch, when the well of the sea was 2 feet; and M. Baily observed, that with this instrument he could discern the difference of one roth of an inch in the height of the tide.

GE, WIND, an instrument for measuring the force of the wind upon any given surface. It was invented by Dr Lind, who gives the following description of it. *Phil. Trans.* vol. lxxv. See *fig. 5*. This instrument consists of two glass tubes AB, CD, of 5 or 6 inches in length, the diameters of which are so much the better for being about four roths of an inch in diameter, which are connected together like a siphon, by a bent glass tube *ab*, the bore of which is $\frac{1}{8}$ roth of an inch in diameter. On the top of the leg A B there is a tube of latten which is kneed, or bent perpendicularly upwards, and has its mouth open towards the sky. The upper leg CD, is a cover with a round hole in the upper part of it, two roths of an inch in diameter.

This cover and the kneed tube are joined together by a slip of brass *cd*, which gives strength to the whole instrument, and serves to hold the scale III. The kneed tube and cover are fixed on with hard cement, and wax. To the same tube is soldered a brass *e*, with a round hole in it to receive a spindle KL; and at *f* there is just another slip of brass soldered to the brass hoop *gb*, which rounds both legs of the instrument. A small shoulder on the spindle at *f*, upon which the instrument rests, and a small nut at *i*, to prevent it from being blown off the spindle by the wind.

The whole instrument is easily turned round the spindle by the wind, so as always to have the mouth of the kneed tube towards the wind, and the end of the spindle has a screw on it; by which it may be screwed into the top of a post or into a wall on purpose. It has also a hole at L, and a small lever for screwing it into wood with readiness and facility. A thin plate of brass is soldered to the kneed tube, about half an inch from the round hole G, so as to prevent rain from falling into it. There is likewise a crook-B, (*fig. 6*.) to be put occasionally upon the end of the kneed tube F, to prevent rain from being blown into the mouth of the wind tube, when it is left out all night, or exposed in a storm. The force or momentum of the wind may be ascertained by this instrument, by

filling the tubes half full of water, and pushing the scale a little up or down, till the 0 of the scale, when the instrument is held up perpendicularly, be on a line with the surface of the water in both legs of the wind gage. The instrument being thus adjusted, hold it up perpendicularly, and turning the mouth of the kneed tube towards the wind, observe how much the water is depressed by it in the one leg, and raised in the other. The sum of the two is the height of a column of water which the wind is capable of sustaining at that time; and every body that is opposed to that wind will be pressed upon by a force equal to the weight of a column of water, having its base equal to the altitude of the column of water sustained by the wind in the wind gage. Hence the force of the wind upon any body, where the surface opposed to it is known, may be easily found; and a ready comparison may be made betwixt the strength of one gale of wind and that of another. The force of the wind may be likewise measured with this instrument, by filling it until the water runs out at the hole G. For if we then hold it up to the wind as before, a quantity of water will be blown out; and if both legs of the instrument are of the same bore, the height of the column sustained will be equal to double the column of water in either leg, or the sum of what is wanting in both legs. But if the legs are of unequal bores, neither of these will give the true height of the column of water which the wind sustained. But the true height may be obtained by the following formulae. Suppose that after a gale of wind which had blown the water from A to B, *fig. 7*, forcing it at the same time through the other tube out at L, the surface of the water should be found standing at some level DG, and it were required to know what was the height of the column EF or AB, which the wind sustained. In order to obtain this, it is only necessary to find the height of the columns DB or GF, which are constantly equal to one another; for either of these added to one of the equal columns AD, EG, will give the true height of the column of water which the wind sustained. I. Let the diameters AC, EH, of the tubes, be respectively represented by c^2 ; and let $a=AD$, or EG , and $x=DB$, or GF : Then it is evident, that the column DB is to the column EG, as c^2x to d^2a . But these columns are equal.

Therefore $c^2x=d^2a$; and consequently $x=\frac{d^2a}{c^2}$.

II. But if at any instant of time whilst the wind was blowing, it was observed, that, when the water stood at E, the top of the tube out of which it is forced, it was depressed in the other to some given level BF, the altitude at which it would have stood in each, had it immediately subsided, may be found in the following manner: Let $l=AB$ or EF .—Then it is evident that the column DB is equal to the difference of columns EF, GF. But the difference of these columns is as d^2b-a^2x ;

and consequently $x=\frac{d^2b}{c^2+d^2}$. For the cases when

the wind blows in at the narrow leg of the instrument: Let $AD=EF=l$, $EF=l$, or $AD=l$, $GF=x$, $DB=x$, and the diameters EH, GA, respectively c^2 , d^2 .

$\equiv d, c$, as before. Then it is evident, that the column AD is to the column GF as ac^2 to d^2x . But these columns are equal; therefore $d^2x \equiv ac^2$; and

consequently $x \equiv \frac{ac^2}{d^2}$. It is also evident that the

column AD is equal to the difference of the columns AB, DB; but the difference of these columns is as $bc^2 - c^2x$. Therefore $d^2x \equiv bc^2 - c^2x$.

Whence we get $x \equiv \frac{bc^2}{d^2 + c^2}$. The use of the small

tube of communication $a b$, fig. 5, is to check the undulation of the water, so that the height of it may be read off from the scale with ease and certainty. But it is particularly designed to prevent the water from being thrown up to a much greater or less altitude, than the true height of the column which the wind is able at that time to sustain, from its receiving a sudden impulse whilst it is vibrating either in its ascent or descent. As in some cases the water in this instrument might be liable to freeze, and thus break the tubes, Dr Lind recommends a saturated solution of sea salt to be used instead of it, which does not freeze till Fahrenheit's thermometer falls to 0.

(1.) * To GAGE. *v. a.* [*gager*, French.] 1. To wager; to depute as a wager; to impawn; to give as a caution, pledge, or security.—

A moiety competent

Was gaged by our king. *Shak. Hamlet.*
—He found the Turkish merchants making merry: unto these merchants he gave due salutations, gaging his faith for their safety, and they likewise to him. *Knolles's History.* 2. To bind by some caution or surety; to engage.—

My chief care

Is to come fairly off from the great debts
Wherein my time, something too prodigal,
Hath left me gaged. *Shakespeare.*

3. To measure; to take the contents of any vessel of liquids particularly. More properly gauge. See GAUGE.—

We shall see your bearing.

(1.) * GAIN. *n. f.* [*gain*, French advantage: contrary to *loss*.—But were *gain* to m-, those I counted to *Phil.* in. 7.—Besides the purpose it teach how victory should be used, thereof communicated to the general *leigh's Essays*.—

Have, k and spoil, and ruin are u —It is in praise of men as in getting

ains make heavy purses; for light gains
 k, whereas great come but now and
 on's *Essays*.—This must be made by
 ernor upon his own private account,
 great stock that he is content to turn
 and is invited by the gains. *Temple*.—
 ute the gains of his ungovern'd zeal,
 his cloth the praise of railing well. *Dryd.*
 fights for kings or dives for gain. *Pope*.
 ; lucrative views.—

fir, which serves for gain;
 lows but for form,
 pack, when it begins to rain,
 ve thee in the storm. *Shak. King Lear*.
 ul advantage.—Did I make a gain of you
 them whom I sent unto you? *2 Cor. xii.*

de, if envy, if the lust of gain,
 ambition in thy bosom reign,
 boast'st, alas! thy sober sense in vain;
Fitzgerald.

as is a comparative computation; any
 sed to loss.

in, (§ 1. *def.* 1.) is derived by some from
 in *gewin*. There are legal and reputable
 sell as sordid and infamous ones. What
 beyond a certain sum, by gaming, is all
 e restored again, if the loser will take
 of the law.

in, in architecture, is the workmen's
 the bevelling shoulder of a joist or other
 it is used also for the lapping of the end
 . &c. upon a trimmer or girder; and
 hickness of the shoulder is cut into the
 also bevelling upwards, that it may just
 gain; and so the joist and trimmer lie
 level with the surface. This way of
 used in floors and hearths.

GAIN. *adj.* [An old word now out of
 ly; ready; dexterous. *Preface to the*

to GAIN. *v. a.* [*gagner*, French.] 1. To
 profit or advantage.—Egypt became a
 u d by the muddy and lineous matter
 own by the Nile, which settled by de-
 a firm land. *Brown's Vulg. Err.*—

le gains, to live as Man,
 degree of life,
 reinforcement we may gain from hope.
Milton.

; not to lose.—
 er once he lost, and gain'd a king. *Milt.*
 e the overplus in comparative computa-
 you have two vessels to fill, and you
 to fill the other, you gain nothing by
 it's *Theory*. 4. To obtain; to procure;
 —

acceptance found, which gain'd
 ver from the gracious voice divine. *Milt.*
 t fi le some small reflection gains
 r'ring air, less vex'd with tempest loud.
Milton.

tradition were endeavoured to be set
 s not easy to imagine how it should at
 tertainment; but much more difficult
 how ever it should come to be uni-
 pagated. *Tillotson's Sermons*.—

ne with toil we gain, but lose with ease,
Part I.

Sure some to vex, but never all to please. *Pope*.
 5. To obtain increate of any thing allotted—I know
 that ye would gain the time, because ye see the
 thing is gone from me. *Dan. ii. 8.* 6. To obtain
 whatever, good or bad.—Ye shoul I not have loosed
 from Crete, and to have gain'd this harm and loss.
Ads, xxvii. 21. 7. To win against opposition.—
 They who were sent to the other pala, after a
 short resistance gained it. *Clarendon*.—

Fat fees from the defended Umbrian draws,
 And only gains the wealthy client's caule.

Dryden's Persius.

O love! for Sylvia let me gain the prize,
 And make my tongue victorious as here eyes. *Pope*.
 8. To draw into any interest or party.—

Come, with presents, laden from the port,
 To gratify the queen and gain the court. *Virg.*
 If Pyrrhus must be wrought to pity,
 No woman does it better than yourself:
 If you gain him, I shall comply of course. *Phil.*

9. To obtain as a wooer.—

He never shall find out fit mate, but such
 As some misfortune brings him, or mistake,
 Or whom he wishes most shall seldom gain
 Through her perverse, but shall see her gain'd
 By a far worse. *Milton.*

10. To reach; to attain.—

The West still glimmers with some streaks of
 day:

Now spurs the lated traveller apace,
 To gain the timely inn. *Shak. Macbeth.*

Death was the post, which I almost did gain:
 Shall I once more be tost into the main? *Waller.*

Sun! sound his praise

In thy eternal course, both when thou climb'st,
 And when high noon hast gain'd, and when thou
 fall'st. *Milton.*

—We came to the roots of the mountain, and
 had a very troublesome march to gain the top of
 it. *Addison on Italy*.—

Thus sav'd from death, they gain the Phœtan
 shores,

With shatter'd vessels and disabled oars. *Odys.*

11. To GAIN over. To draw to another party or
 interest.—The court of Hanover should have en-
 deavoured to gain over those who were represent-
 ed as their enemies. *Swift*.

(2.) * To GAIN. *v. n.* 1. To grow rich; to have
 advantage; to be advanced in interest or happi-
 nesa.—Thou hast taken usury and increase, and
 thou hast greedily gained of thy neighbours by ex-
 tortions. *Ezek. xxii. 12.* 2. To encroach; to come
 forward by degrees: with *on*.—

When watchful herons leave their watry stand,
 And mounting upward with erected flight,
 Gain on the skies, and soar above the fight.

Dryden's Virgil.

So on the land, while here the ocean gains,
 In other parts it leaves wide sandy plains. *Pope*.

3. To get ground; to prevail against: with *on*.—
 The English have not only gained upon the Vene-
 tians in the Levant, but have their cloth in Venice
 itself. *Addison*. 4. To obtain influence with: with
on.—My good behaviour had gained so far on the
 emperor, that I began to conceive hopes of liber-
 ty. *Swift*.

(4.) To GAIN THE WIND, in sea language, is
 to arrive on the weather side or to windward of

some other vessel in sight, when both are plying to windward, or sailing as near the wind as possible.

(1.) **GAINAGE**, **GAINAGIUM**, in ancient writers, signifies the draught oxen, horses, wain, plough, and furniture, for carrying on the work of tillage by the sokemen and villains. Gainage is the same with **WAINAGE**. *Beacon*, lib. 1. cap. 9. speaking of lords and servants, says, *Ut si eos destruant, quod saluum non possit eis esse wainagium suum*. And again, lib. iii. tract. 2. cap. 1. *Fil. laus non amercibitur, nisi falso wainagio suo*. For anciently, as it appears both by *Magna Charta* and other books, the villain, when amerced, had his gungage free, that his plough might not stand still: and the law, for the same reason, still allows a like privilege to the husbandman, that is, his draught horses are not in many cases distrainable.

(2.) **GAINAGE** is also used for the land itself, or the profit raised by cultivating it.

GAINBATESA, a town of Naples, in the county of Molise, 18 miles ESE. of Molise.

* **GAINER**. *n. f.* [from *gain*.] One who receives profit or advantage. —The client, besides retaining a clear conscience, is always a *gainer*, and by no means can be at any loss, as setting, if the composition be overheard, he may relieve himself by recourse to his oath. *Bacon's Off. of Allegation*. —

If what I get in empire

I lose in fame, I think myself no *gainer*. *Denb.* —He that loses any thing, and gets wisdom by it, is a *gainer* by the loss. *L'Estrange*. —By trade, we are as great *gainers* by the commodities of other countries as of our own nation. *Addison's Freeholder*.

GAINFARHN, a town of Austria, one mile SSW. of Baden.]

* **GAINFUL**. *adj.* [from *gain* and *ful*.] 1. Advantageous; profitable. —He will dazzle his eyes, and bait him in with the luscious proposal of some *gainful* purchase, some rich match, or advantageous project. *South*. 2. Lucrative; productive of money —

Nor knows he merchants *gainful* care. *Dryd.*
Mars's muse commodious precepts gives,
Instructive to the swains, nor wholly bent
On what is *gainful*: sometimes she diverts
From solid counsels. *Philips*.

* **GAINFULLY**. *adv.* [from *gainful*.] Profitably; advantageously.

* **GAINFULNESS**. *n. f.* [from *gainful*.] Profit; advantage.

* **GAINGIVING**. *n. f.* [from *gainst* and *give*.] The same as *misgiving*; a giving against: as *gain saying*, which is still in use, is saying against, or contradicting. *Hanmer*. —It is but foolery; but it is such a kind of *gaingiving*, as would perhaps trouble a woman. *Shak. Ham.*

* **GAINLESS**. *adj.* [from *gain*.] Unprofitable; producing no advantage.

* **GAINLESSNESS**. *n. f.* [from *gainless*.] Unprofitableness; want of advantage. —The parallel holds too in the *gainlessness* as well as laboriousness of the work: miners, buried in earth and darkness, were never the richer for all the ore they digged; no more is the insatiable miser. *Decay of Piety*.

* **GAINLY**. *adv.* [from *gain*.] dily; dexterously. Out of use.

* **To GAINSAY**. *v. a.* [from *gainst*.] To contradict; to oppose; to con- to dispute against. —Speeches, while another, must of necessity be applied one and the same subject. *Hooker* —

Too facile then, thou didst not
Nay, didst permit, approve, and

z. To deny any thing. —

I never heard yet

That any of those bolder vices w
Less impudence to *gainsay* what
Than to perform it first. *Shak.*

* **GAINSAYER**. *n. f.* [from *gainst*.] A dissent; adversary. —Such as may sat when suddenly, and besides expect quire the same at our hands. *Hom* for this cause, challenged as manifest Scripture, even in that which we r ture unto the people. *Hooker*. —It of conviction to all *gainsayers*. *Hamm* fought themselves a name by being but failed of their purpose. *Fell*.

(1.) **GAINSBOROUGH**, a town shire, 150 miles from London, seat near the sea. It is a large well built has a pretty good trade. The north neighbourhood is noted for horse Danes, when they invaded the king their ships to this place; and their king was murdered. See *EW* 18. It lies 18 miles NW. of Lincoln W. Lat. 53. 27. W.

(2.) **GAINSBOROUGH**, Thomas English painter of landscapes and at Sudbury, in Suffolk, in 1727. self taught, he united the brilliant with the simplicity of *Rydael*. T was equally distinguished for his virt impoverished himself by his generot the needy. He died in 1788.

* **'GAINST**. *prep.* [for *against*.] Tremble, ye nations! who, se Laugh'd at those arms, that 'ga bore.

* **To GAINSTAND**. *v. a.* [from *gainst*.] To withstand; to oppose; to resist word, but not in use. —Have prove ant, that durst with the sword of a *gainstand* the force of so many en *Sidney*.

GAJO, a village of Maritime A Dogado of Venice.

* **GAIRISH**. *adj.* [from *gerian*, to d. 1. Gaudy; showy; splendid; sin four will outrage in apparel, hug strous hats, and *gairish* colours. *A*

I call'd thee then poor shadow

The presentation of but what I w

A mother, only mock'd of two f

A dream of what thou was't, a g

To be the aim of every dangerou

There in close covert by some

Where no profaner eye may look

Hide me from day's *gairish* eye.

magantly gay; flighty.—Fame and glory
a man out of himself: it makes the mind
gairish, scatters the spirits, and leaves a
dissolution upon all the faculties. *South.*
RISHNESS. *n. f.* [from *gairish*.] 1. Fine-
ling gaudiness. 2. Flighty or extrava-
—Let your hope be without vanity, or
of spirit, but sober, grave, and silent.

IRLOCH, [Gael. *i. e.* a short lake.] a
Scotland, in Ross-shire, 31 miles long,
and, consisting chiefly of hills and moor-
lands, afford good pasture, but the arable
land of small extent, and consequently the
corn and potatoes do not supply the na-
tional wants 8 months in the year. The coast a-
round safe harbours, and is famous for its cod-
fisheries. Sir Hector M'Kenzie the
last, sends to market annually from 30, to
40, exclusive of the quantity consumed
at home. The population in 1792, stated by
Mr Dan. M'Intosh, in his report to Sir
James, was 2200, and had increased 150,
in 1800. Two persons died lately aged 100 each.
IRLOCH, a small lake in the above pa-
rish, to which it gives name, so close by
the sea, that the sea covers it at high tides.

IRLOCH BAY, a bay on the W. coast
of Ross-shire, famous for its fishery of cod, &c.
ORNEY, one of the Orkney Islands.

ERN, a town of Germany, in Stiria.
G. *n. f.* [gat, Dutch.] 1. A way; as,
gait.—

Good youth, address thy *gait* unto her;
denied access; stand at her door. *Shak.*
; walk.—

Right regarding, they kept on their *gait*,
her vain allurements did forsake. *F. Q.*
part so lean and meagre waxen late,
where thy legs uphold thy feeble *gait*.

Hubbard's Tale.

inner and air of walking.—
Juno comes; I know her by her *gait*.

Shak.

in his person, in his aspect, the appear-
ance of a great man, which he preserved in his
motion. *Claren.*—

A third, who, by his *gait*
of demeanour, seems the prince of hell.

Milton.

Leviathans

ing, unwieldy, enormous in their *gait*.
Milton.

I describ'd his way,
on speed, and mark'd his airy *gait*.
Milton.

OR GALA WATER, a river of Scotland
in Ross-shire, which runs into the Tweed
at Melrose, 2 miles above Melrose.

TITES, in natural history, a substance
resembling FRENCH CHALK, in many re-
spects different from it in colour. The an-
cient used it in the Nile, and in some rivers in
Egypt used it in medicine as an astringent,
for the cure of the eyes. At present
it is used in Germany, Italy, and some parts
of France, but it is little regarded, being esteemed
inferior to MOROCHTHUS.

GALACTOPHAGI, and **GALACTOPOTÆ**, } [from *γᾱλα*, *γᾱλακ-*
milk; *φαγειν*, to
eat; and *ποτος* of *πινω*, I drink.] in antiquity, per-
sons who lived wholly on milk, without corn or
any other food. Certain nations in Scythia Asi-
atica, as the Getæ, Nomades, &c. are famous
in ancient history, as *galactophagi*. Homer makes
their eulogy, *Iliad*, lib. iii. Ptolemy, in his geo-
graphy, places the Galactophagi between the Ri-
phæan mountains on one side, and the Hircanian
sea on the other.

GALACZ, **GALASI**, or **GALATZ**, a town of
European Turkey, in Bulgaria, near the Danube,
54 miles W. of Ismael, and 20 SSW. of Bender;
between the Pruth and the Seret.

* **GALAGE.** *n. f.* A shepherd's clog. Not
in use.—

My heart's blood is nigh frore, I feel;

And my *galage* grown fast to my heel. *Spenser.*

GALAM, a fort of Africa, on the Senegal,
built by the French, but ceded to Britain in 1763.
It was taken by the French during the American
war, and again ceded to Britain in 1783.

GALAN, a town of France, in the dep. of the
Upper Pyrennees, 15 miles E. of Tarbes.

(1.) * **GALANGAL.** *n. f.* [*galange*, French.]
A medicinal root. The lesser *galangal* is in pie-
ces, about an inch or two long, about the thick-
ness of a man's little finger; of a brownish red
colour, hot and pungent. The larger *galangal* is
in pieces, about two inches or more in length;
and an inch in thickness; its colour is brown,
with a faint cast of red in it: it has a disagreeable
but much less acrid and pungent taste. *Hill.*

(2.) **GALANGAL.** See **KÆMPFERIA**, N° 1.

GALANTHUS, the SNOW-DROP, in botany:
A genus of the monogynia order, belonging to
the hexandria class of plants; and in the natural
method ranking under the 19th order, *Spatheaceæ*.
There are 3 concave petals; and the nectarium
consists of 3 emarginated petals; the stigma is
simple. There is but one species, viz. the

GALANTHUS NIVALIS, a bulbous rooted flow-
ery perennial, rising but a few inches in height,
and adorned at top with small tripetalous flowers
of a white colour. There are 3 varieties, viz. the
common single-flowered snow-drop, the semi-dou-
ble snow-drop, and the double snow-drop. They
are beautiful little plants; and are much valued on
account of their early appearance, often adorning
the gardens in January or February, when scarce
any other flower is to be seen. They frequently
burst forth when the ground is covered with snow,
and continue very often till the beginning of
March, making a very ornamental appearance,
especially when disposed in clusters towards the
fronts of the borders, &c. The single kind comes
first into bloom, then the semi-double, and after
that the double. They succeed in any soil, and
multiply exceedingly by offsets from the roots.

GALARED, a town of Sweden, in Blekingen.
GALARGUES, or } a town of France, in the
GALARQUES, } dep. of Gard, 6 miles SE.
of Sommieres.

GALARS, a town of Transylvania, 16 miles
SE. of Hunyad.

(1.) **GALASHIELS**, a parish of Scotland, in
the

the counties of Roxburgh and Selkirk, of an irregular triangular form, about $5\frac{1}{4}$ miles broad, seated on the Tweed, which divides it into two parts, and separates the counties. The surface is hilly and affords good pasturage. The climate is dry and healthy. The soil, S. of the Tweed, is deep, heavy, cold and wet; but on the N. dry, shallow, and remarkably full of small stones; which, nevertheless, it has been found dangerous to remove, as they reflect heat, retain moisture, and thus contribute to the production of most luxuriant crops. The parish contains 8000 acres, of which 1500 are arable, 6000 in pasture, 200 under wood, and 200 in mosses, lakes, banks of rivers, &c. Oats, barley, wheat, pease, clover, and potatoes, are raised. The population in 1791, stated by the rev. Mr Douglas, in his report to Sir J. Sinclair, was 914, and had decreased 84, since 1755. The number of sheep was about 5000.

(2.) **GALASHIELS**, a small town in the above parish, containing 581 inhabitants in 1791. It has a considerable manufacture of coarse woollen cloth; 43 looms being employed, and 52,000 yards made annually. Tanning, carpentry, and other branches are also carried on. It has 5 fairs, in March, July, Sept. Oct. and Nov. It is seated at the conflux of the Gala and Tweed, 25 m. S. by E. of Edinburgh, and 5 N. of Selkirk.

GALASI. See **GALACZ**.

GALASO, a town of Naples in Otranto.

(1.) **GALATA**, a great suburb of Constantinople, opposite to the seraglio, on the other side of the harbour, where the Greeks, Armenians, Franks, Christians, and Jews inhabit, and are allowed the exercise of their respective worships.

(2.) **GALATA**, an island near the coast of Tunis. Lon. 9. 30. E. Lat. 38. 15. N.

GALATÆ, the inhabitants of **GALATIA**.

GALATHÆA, or in mythology, a sea nymph,

GALATHÆA, daughter of Nereus and Doris. She was beloved by the Cyclops Polyphemus, whom she treated with disdain; while Acis, a shepherd of Sicily, enjoyed her affection. The Cyclops killed his rival with a piece of a rock while he reposed on the bosom of Galathea. The nymph, inconsolable for the loss of Acis, as she could not restore him to life, changed him into a fountain.

GALATEO, a town of Naples in Calabria Ultra, 8 miles ESE. of Nicotera.

GALATI, a town of Sicily, in the valley of Demona, 12 miles SW. of Pati.

GALATIA, the ancient name of a province of Asia Minor, now called **AMASIA**. It was bounded on the E. by Cappadocia, on the S. by Pamphilia, on the N. by the Euxine sea, and on the W. by Bithynia. It was the N. part of Phrygia Magna; but upon being occupied by the Gauls, was called *Galatia*; and because situated amidst Greek colonies, and its natives mixed with Greeks, **GALLOGRÆCIA**. Strabo calls it *Galatia*, and *Gallogræcia*; hence a twofold name of the people, **GALATÆ** and **GALLOGRÆCI**. The Greeks called it **GALLIA PARVA**, to distinguish it from **GALLIA TRANSALPINA**, both which they called *Galatia*. It was reduced by the Romans under Augustus, and now belongs to the Turks. Here St Paul founded a church. See **GALATIANS**, § 2.

(1.) **GALATIANS**, the people of **GALATIA**.

(2.) **GALATIANS**, **EPISTLE TO THE**, a canonical book of the New Testament, written by the apostle Paul to the primitive Christians in order to reclaim them from the observation of Jewish ordinances, into which they had been seduced by the Judaizing teachers.

GALATOLA, a town of Naples, in the province of Otranto, 4 miles ESE. of Nardo.

GALATON, a village of Fifeshire, 10 miles to Dysart, containing 432 inhabitants in 1801. Its population had increased 227 since 1756. Weaving and nail making are the chief trades.

GALATZ. See **GALACZ**.

GALAX, in botany: A genus of the *Scrophularia* order, belonging to the pentandria; and in the natural method ranks with those of which the order is doubtful. The corolla is salver-shaped; the calyx decapphyllous; the capsule unilocular, bivalved, and elastic.

GALAXIA, in botany: a genus of the *Scrophularia* order, belonging to the Monadelphous plants.

(1.) * **GALAXY**. *n. f.* [*γαλαξία*; *galaxia*]. The milky way; a stream of light in the heavens.

A broad and ample road, whose dust
And pavement stars, as stars to thee
Seen in the *galaxy*. *Milton's Paradise Lost*

A brown, for which heaven would
The *galaxy*, and stars be tann'd. *Coleridge's Ancient Mariner*

Several lights will not be seen,
If there be nothing else between;
Men doubt, because they stand so thick
If those be stars that paint the *galaxy*.

—We dare not undertake to shew what
is brought to us by those innumerable stars
of the *galaxy*. *Bentley*.

(2.) *The GALAXY*, is that long white track, which seems to encompass the heavens, and is easily perceivable in a clear sky, especially when the moon does not shine. The ancients called it *γαλαξίας*, of *γαλα*, *γαλακτός*, *Milk*, as it resembles *via lactea*, the milky way, on account of its colour and appearance. And their poets have many fables about the spilling of *Juno's* milk as the cause of its whiteness. It passes through *Sagittarius* and *Gemini*, and divides the heavens into two parts; it is unequally broad; in some places single, in others double. The ancient philosophers, even philosophers, speak of the *Galaxy* as a way by which the heroes went to heaven. Some supposed it a kind of meteor, formed of clouds of vapours, drawn into that part by certain stars disposed in the region of the heavens, and shining hereto. Others, finding that the *Galaxy* was seen all over the globe, that it always corresponded to the same fixed stars, and that it terminated at the height of the highest planets, set aside the poet's opinion; placed the *Galaxy* in the firmament, or region of the fixed stars, and concluded it to be nothing but an assemblage of an infinity of minute stars. Since the invention of the telescope, this opinion has been abundantly confirmed. By directing a good telescope to any part of the milky way, where before we only saw a whitened light, we now descry an innumerable multitude of little stars, so remote, that they almost confound them. (See **ASTRONOMY**, *De*

Monnier still disputes this opinion, and the whiteness to be occasioned by some kind of matter. See his *Inst. Astr.* p. 60. **GALBA**, Servius Sulpicius, emperor of Rome, 7th of the Cæsars, born the 24th Dec. 5. He was gradually raised to the highest of the state, and exercised his power in the with the greatest equity. He dedicated his time to solitary pursuits, to avoid the of Nero. Expressing his disapprobation of Nero's oppression in the provinces, earned him to be put to death; but he eschewed the executioner, and was publicly sacrificed. When seated on the throne, he allowed himself to be governed by favourites, who misled the citizens. Exemptions were sold at dearth; and impunity even for murder was purchased with money. Such irregularities grieved the people; and Galba refusing to give the soldiers the money he had promised them, limited him in the 73d year of his age, the month of his reign. The virtues which shone so bright in Galba, when a private man, disappeared when he ascended the throne; who had showed himself the most impartial, forgot his duty when emperor.

GALLY, a town of Ireland, in Limerick.

GALBANUM. *n. s.* We meet with it sometimes in loose granules, called drops which is the purest, and sometimes in masses. It is soft, like wax, and ductile between the fingers; of a yellowish or reddish colour, its smell is strong and disagreeable. It is of a nature between a gum and a resin, being as soluble as a resin, and soluble in water as a gum, but not dissolve in oil as pure resins do. It is the produce of an umbelliferous plant. *Hill's Medica.*—It yielded indeed a pleasant odour, like the best myrrh; as *galbanum*. *Ecclus.* xxiv. 15. **GALBANUM** issues from the stem of an aromatic plant, growing in Persia and many parts of Africa. See **BUBON**, § 1, 2. The juice is pellucid, soft, tenacious; of a strong smell, rather warm taste; the better sort is in rounded masses, composed of clear white oil. Geoffroy relates, that a dark greenish oil is obtained from this by distillation, which, after repeated rectifications, becomes of an elegant blue colour. The purer sorts of galbanum said by some to dissolve entirely in wine, or water; but these liquors are only partial solvents with regard to this drug; nor do wine or oils prove more effectual in this respect. The best solvent is a mixture of two parts of wine and one of water. Galbanum is of great virtue with gum ammoniac, but is generally accounted less efficacious in asthma, and in hysterical complaints. It is an ingredient in the gum pills, the gum plaster, and some medicinal compositions.

GALATEA, a town of the Cisalpine republic, sept. of Montagna, and late county of Comasco, situated on the W. bank of lake Como, opposite to Lugano.

BRUNN, a town of Germany, in Austria, NW. of Brugg.

DER, a town in the Isle of Canary.

GALE, Dr John, an eminent minister a-

mong the Baptists, born at London in 1680. He studied at Leyden, and afterwards at Amsterdam, under Dr Limborch. He was chosen minister of the Baptist congregation at Barbican; where his preaching, being chiefly practical, was greatly resorted to by people of all persuasions. He died in 1721. Four volumes of his sermons were published after his death. His *Reflections on Dr Wall's History of Infant Baptism* is the best defence of the Baptists ever published, and the reading of that performance induced the learned Mr William Whiston and Dr Foster to become Baptists.

(2.) **GALE**, Theophilus, an eminent nonconformist minister, born in 1628. He was invited to Winchester in 1657, and continued a stated preacher there until the re-establishment of the church by Charles II; when he rather chose to suffer the penalties of the act of conformity, than to submit to it contrary to his conscience. He was afterwards engaged by Philip lord Wharton as tutor to his sons, whom he attended to an academy at Caen, in Normandy; and afterwards became pastor to a congregation of Dissenters in Holborn. He died in 1678; and is principally known by an elaborate work, intitled, the *Court of the Gentiles*, calculated to show, that the Pagan philosophers derived their most sublime sentiments from the Scriptures.

(3.) **GALE**, Thomas, D. D. and F. R. S. a learned divine, born at Scruton, in Yorkshire, in 1636. He was educated at Cambridge, and became professor of Greek in that university. He was afterwards chosen head master of St Paul's school, London; and wrote those elegant inscriptions on the monument erected in memory of the conflagration in 1666. In 1676, he was made a prebendary in St Paul's; and being elected a F. R. S. presented a Roman urn to the society. About 1697, he gave to the new library of Trinity college, in Cambridge, a great number of Arabic MSS.; and in 1697 was admitted dean of York. He died in that city in 1702; and was interred in the cathedral, where a monument was erected to his memory. He was a great historian, one of the best Greek scholars of his age, and corresponded with the most learned men at home and abroad. He published, 1. *Historiæ Poeticæ Antiqui Scriptores*, 8vo. 2. *Opuscula Mythologica, Ethica, & Physica*, in Gr. and Lat. 8vo. 3. *Herodoti Historia*, fol. 4. *Historiæ Anglicanæ Scriptores quinque*, in fol. 5. *Historiæ Britannicæ, Saxonicæ, Anglo-Danicæ, Scriptores quindecim*, fol. 6. *Rhetores Selecti*, &c.

(4.) **GALE**, Roger, F. R. & A. S. S. eldest son of the preceding (Nº 3.) was educated at Trinity college, Cambridge, of which he was chosen fellow in 1697. He was M. P. for N. Allerton, in the 3 first British Parliaments. He was first Vice-president of the Society of Antiquaries, and Treasurer to the Royal Society. He died in 1744, and was esteemed one of the most learned men of his age. He published several valuable books, particularly an edition of Antoninus's Commentary.

(5.) **GALE**, Samuel, younger brother to Roger (Nº 4.) was also eminent for his learning and knowledge of antiquities. He died in 1754, aged 72.

(6.) * **GALE**. *n. s.* [*ghaling*, hasty, sudden, German.] A wind not tempestuous, yet stronger than a breeze.—

What happy gale
Blows you to Padua here, from old Verona!

Shakspeare.

Winds
Of gentlest gale Arabian odours ann'd
From their soft wings, and Flora's earliest smells.

Milton.

Fresh gales and gentle air.
Umbria's green retreats

Milton.

Where western gales eternally reside. *Addison.*

(7.) GALE, in sea language, a term of various import. When the wind blows not so hard but that a ship may carry her top sails a-trip, (that is, hoisted up to the highest,) they say it is a loom gale. When it blows very strong, it is a stiff, strong, or flesh gale. See next article.

To GALE, *v. n.* When two ships are near one another at sea, and, there being but little wind blowing, one of them finds more of it than the other, they say that the one ship gales away from the other.

GALEA, in antiquity, a light casque, head-piece, or morrion, which came down to the shoulders, commonly of brass. Camillus, according to Plutarch, ordered those of his army to be of iron, as being the stronger metal. The lower part of it was called *buccula*, and on the top was a crest. The Velites wore a light galea, made of the skin of some wild beast, to make it more terrible.

GALEANO, Joseph, a learned physician of Palermo, born in 1605. He was author of several medical works, and published a Collection of the Sicilian Poets, in 5 vols. He died in 1675.

GALEASSE. See GALASSA.

* GALEATED *adj.* [*galeatus*, Lat.] 1. Covered as with a helmet — A galeated elminius copped, and in shape somewhat more corick than any of the foregoing. *Woodw. on Foss.* 2. [In botany.] Such plants as bear a flower resembling an helmet, as the monkshood.

GALEGA, in botany, a genus of the decandria order, belonging to the diadelphica class of plants; and in the natural method ranking under the 3rd order, *Papilionaceae*. The calyx is composed of subulated nearly equal dents or segments; the legumen has oblique suture, and seeds lying between them.

GALEGOS, a town of Portugal, in Entre-duero-e-minho, 4 miles NE. of Barcelos.

(1.) GALEN, Claudius, prince of the Greek physicians after Hippocrates, was born at Pergamus, in Asia Minor, A. D. 131. His father being possessed of a fortune, and well versed in philosophy, astronomy, geometry, and architecture, instructed his son in the first rudiments of learning, and afterwards procured him the greatest masters of the age. Galen, having finished his studies, chose physic for his profession, studied the works of Hippocrates, and at length resolved to travel, to converse with the most able physicians in all parts, and to take every opportunity of inspecting on the spot the plants and drugs of the countries thro' which he passed. With this view he went to Alexandria, where he staid some years; thence he travelled through Cilicia, Palestine, Crete, Cyprus, Lemnos, and the Lower Tyria; in which last place he obtained a thorough insight into the nature of the Lemnian earth, and the opobalsamum;

after which he returned home by . Galen had been 4 years at Pergamus, practice was attended with extraordinary success when some commotions induced him to Rome, where he resolved to settle: but he gave of his superior skill, added to shown him by several persons of very great rank, created him so many enemies among the of the faculty, that he was obliged to leave after having resided there 4 or 5 years, not long returned to Pergamus, when called by the emperor Aurelius and after their death, he retired to his native where he died, about A. D. 200. He was a Greek; and is said to have composed 2000 which were unhappily burnt in the temple. The best editions of those that remain, printed at Basil in 1538, in 5 vols. and in 1625, in 7. Galen was of a weak constitution, as he himself asserts; but he overcame, by his temperance and skill, arrived to a great age. One of his rules was to rise from table with some degree of appetite. He is justly considered as the physician of antiquity, next to Hippocrates; he performed such surprising cures, that he was accused of magic.

(2.) GALEN, in geography, a military ship of New York, 12 miles NW. of 13.

(1.) GALENA, in mineralogy, a species of lead ore.

(2.) GALENA, in ancient pharmacy given by Andromachus to the theriac effect in bringing on a pleasing calm blood and spirits.

GALENBULON, a town of Madagascar, 71. 30. E. of Ferro. Lat. 17. 20. S.

GALENIA, in botany, a genus of 1 order, belonging to the octandria class and in the natural method ranking under order, *Succulente*. The calyx is trisid; corolla; the capsule is roundish and di-

(1.) GALENIC, or } *adj.* in medic
(2.) GALENICAL, } plied to that considering and treating diseases, found principles of Galen, or introduced by This author, collecting and digesting physicians before him had done, and every thing according to the strictest the Peripatetics, set physic on a new foundation, introduced the doctrine of the 4 elemental qualities and their degrees; and mours, or temperaments.

(2.) GALENICAL is more frequent contradistinguished from *chemical*. The of *galenical* and *chemical* was occasional union of the practitioners of medicine into GALENISTS and CHEMISTS, on the introduction of chemistry into medicine. The cherishing to themselves every kind of mediocrity, stirred up an opposition to their party founded on the invariable adherence of party to the ancient practice. And this division has long ceased, yet the distinct medicines which resulted from it is still See § 3.

(3.) GALENICAL MEDICINES are those formed by the easier preparations

c. by infusion, decoction, &c. and by
ing and multiplying ingredients; while
chemistry draw their more intimate and
virtues by means of fire, and elaborate
ions, as calcination, digestion, fermenta-

GALENISTS, a denomination given to
sicians as practise, prescribe, or write on
ical principles. They stand opposed to
ists. See **GALENICAL**, § 2. The gale-
chemists are now accommodated; and
our physicians use the preparations and
of both.

GALENISTS, or } in church history, a branch
GALENITES, } of Mennonites or Anabap-
take in several of the opinions of the
b, or rather Arians, touching the divinity
aviour. In 1664, the Waterlandians di-
o two parties, of which the one were
ists, from their leader Abraham Gale-
the other *Apollonians*.

GALENUS, Abraham, a learned and elo-
quent of Amsterdam, who considered
as a system that laid much less
practice; and who was for ta-
the communion of the Mennonites all
to acknowledge the divine origin of the
the Old and New Testament, and led
virtuous lives.

GALENUS, Claudius. See **GALEN**, N° 1.
GALEON. See **GALLEON**.

GALEOPSIS, in botany, a genus of the angio-
order, belonging to the didynamia class
1; and in the natural method ranking un-
42d order, *Verticillate*. The upper lip
prolla is a little crenated or arched; the
more than bidentate.

GALEOTTI, Martio, secretary to Matthias,
Hungary, tutor to his son John, and li-
at Buda, was born at Narni, in Italy. He
d a work entitled, *De homine interiore et*
re ejus, in 4to. and a collection of bon mots
Matthias. Being invited by Lewis XI. of
to his court, he went to Lyons, but meet-
ing unexpectedly, he, in descending haf-
ry his respects to the monarch, fell, and be-
corpulent, was so much hurt, that he
after.

GALEERA, a town of Italy, in the prov. of
nio, between Rome and Bracciano.

GALEKA, two towns of Spain; 1. in
a, 5 miles SSW. of Tortosa; 2. in Gra-
miles SSE. of Huesca.

GALEERIA, a gulf on the NW. of Corsica.

GALERICULATE. *adj.* [from *galerus*, Lat.]
as with a hat.

GALERICULUM, in Roman antiquity, a cap
th by men and women, consisting of skin,
dressed with human hair, that the arti-
ferring could scarcely be distinguished from
real. They were used by those whose
s thin; and by wrestlers, to keep their
r from receiving any injury from the nasty
h which they were rubbed all over before
exercised. They seem to have resembled
b.

GALEIRON, a town of Celebes, 15 miles from
r, famous for its fishery.

GALETTA, an island in the Mediterranean,
anciently called *Ægimurus*.

GALEY, a river of Ireland, which rises in Li-
merick, runs through Kerry, and falls into the
Peal.

GALFALLY, a town of Ireland, in Tipperary,
32 miles SE. of Limerick. Lon. 8. 20. W. Lat.
52. 15. N.

GALGACUS, the name given by Tacitus and
other Roman historians, to the King of Scots,
who opposed Agricola, called by Buchanan, and
our other Scots historians, *Corbreus Galdus*. See
AGRICOLA, and **SCOTLAND**.

GALGON, a town of France, in the dept. of
Gironde, 5 miles N. of Libourne.

GALHARA, a town of Portugal, in Beira;
12 miles NE. of Coimbra.

GALIC. See **GÆLIC**, § 1, 2.

GALICANA, a town of Italy, in Lucca.

(1.) **GALICIA**, a province of Spain, bounded
on the N. and W. by the ocean, on the S. by
Portugal, and on the E. by Asturias and Leon.
The air is temperate along the coast, but in other
places, cold and moist. Galicia affords good pas-
ture, but is not populous. It produces wine, flax,
citrons and other fruits: and the mountains af-
ford gold, copper, lead, iron, and vermilion,
wood, &c. It contains 64 towns and cities, and
about 242,264 families. It was anciently a king-
dom under the Suevi. St Jago di Compostella is
the capital.

(2.) **GALICIA**, or **GUADALAXARA**, a country
of Mexico, containing 7 provinces. It has mines
of silver and copper, and abounds with corn.
The climate is temperate. Guadalaxara is the
capital.

(3.) **GALICIA**, the modern name given to a
large country in the S. of Poland, which was
seized on by the late emp. Joseph II, and annex-
ed to the Austrian dominions. It comprehends
a part of Red Russia and the palatinate of Lem-
berg; and is separated from Hungary by the Car-
pathian mountains. It is 280 miles long, and from
60 to 100 broad. Lemberg, or Leopold, is the
capital. Its chief articles of commerce are corn,
wood, cattle, hides, wax, honey, salt, copper,
lead and iron.

GALIGNANA, a town of Maritime Austria,
in the ci-devant Venetian Istria, 14 miles NE. of
Rovigno.

GALILEE, in ancient geography, a province
of Judea, bounded by mount Lebanon on the N.
by the Jordan and the sea of Galilee on the E. by
the Chison on the S. and by the Mediterranean on
the W. It was the scene of many of our Saviour's
miracles; but the bounds of the country are not
now well known, nor the places where many of
the towns stood. It belongs to the Turks.

GALILEANS, a sect of the Jews. Their foun-
der was one Judas, a native of Galilee, who, esteem-
ing it an indignity for the Jews to pay tribute to
strangers, raised up his countrymen against the
edict of Augustus, which had ordered a taxation
of all the subjects of the Roman empire. They
insisted that God alone should be owned as Lord.
In other respects they were of the opinion of the
Pharisees; but, as they judged it unlawful to pray
for infidel princes, they separated from the rest
of

of the Jews, and performed their sacrifices apart. As our Saviour was supposed to be a native of Galilee, and his apostles were mostly Galileans they were suspected to be of this sect; and it was on this principle, as St Jerome observes, that the Pharisees laid a snare for him; by asking, Whether it was lawful to give tribute to Cæsar; that in case he denied it, they might have an occasion of accusing him.

(1.) **GALILEO**, Galilei, the famous mathematician and astronomer, was the son of a Florentine nobleman, and born in 1564. He had from his infancy a strong inclination to philosophy and mathematics; and made prodigious progress in these sciences. In 1592, he was chosen professor of mathematics at Padua; and during his abode there invented the telescope; or, according to others, improved that instrument, so as to make it fit for astronomical observations: See **ASTRONOMY**, *Index*. In 1611, Cosmo II, grand duke of Tuscany, sent for him to Pisa, where he made him professor of mathematics, with a handsome salary; and soon after inviting him to Florence, gave him the office and title of *principal philosopher and mathematician to his highness*. He had been but a few years at Florence, before he was convinced, that Aristotle's doctrine, however ill-grounded, was held too sacred to be called in question. Having observed some solar spots in 1612, he printed that discovery in 1613, at Rome; in which, and in some other pieces, he ventured to assert the truth of the Copernican system, and brought several new arguments to confirm it. For these he was cited before the inquisition; and, after some months imprisonment, was released upon a simple promise, that he would renounce his heretical opinions, and not defend them by word or writing. But having afterwards, in 1632, published at Florence his "Dialogues of the two greatest systems of the world, the Ptolemaic and Copernican," he was again cited before the inquisition, and committed to the prison of that dreadful court at Rome. On June 22d N. S. 1632, the congregation convened; and in his presence pronounced sentence against him and his books, obliging him to abjure his errors in the most solemn manner; committed him to the prison of their office during pleasure; and enjoined him, as a saving penance, for three years, to repeat once a-week the 7 penitential psalms: reserving to themselves, however, the power of moderating, changing, or taking away altogether or in part, the above-mentioned punishment and penance. On this sentence, he was detained a prisoner till 1634: and his *Dialogues of the system of the World* were burnt at Rome. He lived ten years after this, 7 of which were employed in making still further discoveries with his telescope. But by the continual application to that instrument, added to the damage he received in his sight from the nocturnal air, his eyes grew gradually weaker, till he became totally blind in 1639. He bore this calamity with patience and resignation, worthy of a great philosopher. The loss neither broke his spirit, nor hindered the course of his studies. He supplied the defect by constant meditation: whereby he prepared a large quantity of materials, and began to dictate his *own conceptions*; when, wasting away by de-

grees, he expired at Arcetti near Florence Jan. 1642, N. S. aged 78. Among various inventions of which Galileo was the author that of the simple pendulum, which he had in use of in his astronomical experiments. He wrote a great number of treatises, several of which were published in a collection by Signor Mendel under the title of *L'opera di Galilei Galileo*. Some of these, with others of his pieces, translated into English and published by T. Salisbury, Esq; in his mathematical collection &c. in two volumes folio. A volume also of letters to several learned men, and solutions of several problems, were printed at Bologna. Besides these, he wrote many others, which were unfortunately lost through his wife's superstition, who, solicited by her confessor, gave him leave to peruse her husband's MSS. of which he took away as many as he thought not fit to be published.

(2.) **GALILEO**, Vincenzo, the son of the preceding, was also an eminent mathematician, is famous for improving his father's discovery of the pendulum, by applying it to clocks. He made the experiment at Venice in 1649; and Mr. Huyghens afterwards carried the invention to perfection.

GALINACEUS LAPIS. See **GALLINACEUS**.

GALINGEN, a town of Prussia, in the province of Natagen; 4 miles S. of Bartenstein.

GALINHAS, a river of Africa, which rises in the country of Hondo, and runs into the Atlantic 33 miles from Scherbro.

* **GALLOT**. *n. f.* [*galiette*, French.] A small galley or sort of brigantine, built very light, and fit for chase. It carries but one mast, and has three patereroes. It can both sail and row, and has 16 or 20 seats for the rowers, with a man to each oar. *Dist.*—Barbarossa sent a fleet of notable pyrates with thirty *gallots*, who, with their men, were valiantly encountered, and defeated again to their *gallots*. *Knolles's Hist.*

GALIPAGO ISLES, several uninhabited islands in the South Sea, on both sides of the equator, near Terra Firma, belonging to Spain. Longitude between 83. 40. and 89. 30. W. Lat. from 3° to 10° N.

GALISTEO, a town of Spain, in the province of Extremadura, 10 miles E. of Coria.

(1.) **GALITSCH**, a town of Russia, in the province of Kostrom, 56 miles ENE. of Kostrom. Longitude 60° 15' E. of Ferro. Lat. 57. 56. N.

(2.) **GALITSCH**, a large lake of Russia, 50 miles S. of Kostrom, and 30 miles in circumference.

GALIUM, in botany, a genus of the myrtus order, belonging to the tetrandria class of plants; and in the natural method ranking under the 47th order, *Stellatæ*. The corolla is tubular and plain; and there are two rows of seeds. There are many species; of which the most remarkable are the following:

1. **GALIUM APERINE**, **CLIVERS**, or **GALIA**, GRASS, has a square, very rough, jointed, weak stem, 2, 3, or 4 feet long, and adscive branches are opposite; the joints hairy at the top, the leaves, consisting of 8 or 10 at each joint, narrow, pointed, above rough, beneath smooth and carinated: the seeds are rough; flowers small, few, on slender foot-stalks on the top of the branches. It is common in fields by the

, &c. The expressed juice of this plant externally, and the bruised leaves applied in poultice, are said to have been used as a cure for the cancer. The effects, though sure, the course, it is said, requires to be continued for 9 or 10 months. *LUM VERUM*, the *YELLOW LADY'S* W, has a firm, erect, brown, square, leaves generally 8 in each whirl, linear, pinnate, and often reflex; branches short, two from each joint, terminating in small yellow flowers. It grows on dry ground, and on road sides. The magulate boiling milk; and the best beefsteak is said to be prepared with them. We prescribe them in hysteric and epileptic.

Boiled in alum water, they tinge wool. The roots dye a red not inferior to madder, for which purpose they are used in the island. In the *Edinburgh Medical Commentaries* accounts of some violent scorbutic complaints cured by the juice of this plant. Goats eat the plant; horses and swine cows are not fond of it.

GALL. *n. f.* [*goala*, Saxon; *galle*, Fr.]. The bile, an animal juice remarkable for its bitter taste.

Give to my woman's breast,
Like my milk for gall, you murdering
Ministers!

My tongue, a heart of gall,
For spring, but sorrow's fall.

Reason informs us of a vulgar error, that gall is bitter, as their proverb implies it to be; whereas there's nothing sweeter; and what is most unctuous must be of a sweet savour. *Harvey*.—Gall is the best resolvent of curdled milk; Boerhaave

at a time one drop of the gall of an eel cured a scurvy. *Arbut.* 2. The part which contains the gall.

—The married couple, as a testimony of concord, did cast the gall of the sacrifice on the altar. *Brown*. 3. Any thing bitter.

Neither write, my queen,
With mine eyes I'll drink the words you
Send.

Let ink be made of gall. *Sbak. Cymb.*
Poison be their drink.

Worse than gall, the daintiest meat they
Eat!

Still insults, and you must still adore;
That the honey's much, the gall is more.

Dryd. Juv.
Or; malignity.—They did great hurt
To the people. *Spenser on Ireland*. 5. Anger;
Of mind.—

—Your hero were a lover,
As he before had gall and rage;
Was dispirited and low,
As the fight, and shuns the blow. *Prior*.
It hurt by fretting off the skin. [From
—This is the fatalest wound; as much
As the former, as a gangrene is to a gall
Of the tongue. 7. [From *galla*.]
Gallnuts are preternatural and acciden-
tal, produced on trees; but those of the

oak only are used in medicine. We have Oriental and European galls: the Oriental are brought from Aleppo, of the bigness of a large nutmeg, with tubercles on their surface, of a very firm texture, and a disagreeable, acerb, and astringent taste. The European galls are of the same size, with perfectly smooth surfaces: they are light, often spongy, and cavernous within, and always of a lax texture. They have a less austere taste, and are of much less value than the first sort. The general history of galls is this: An insect of the fly kind wounds the branches of the trees, and in the hole deposits her egg: the lacerated vessels of the tree, discharging their contents, form a tumour or woody case about the hole, where the egg is thus defended from all injuries. This tumour also serves for the food of the tender maggot, produced from the egg, which, as soon as it is in its winged state, gnaws its way out, as appears from the hole found in the gall; and where no hole is seen, the maggot, or its remains, are sure to be found within. It has been observed, that the oak does not produce galls in cold countries; but this observation should be confined to the medicinal galls; for all those excrescences which we call oak-apples, oak-grapes, and oak-cones, are true galls, though less firm in their texture. *Hill*.—Besides the acorns, the oak beareth galls, oak-apples, and oak-nuts. *Bacon's Nat. Hist.*—Malpighi, in his treatise of galls, under which name he comprehends all preternatural and morbose excrescences, demonstrates that all such excrescences, where any insects are found, are excited by some venenose liquor, which, together with their eggs, such insects shed. *Ray on Creation*.—The Aleppo galls, wherewith we make ink, are no other than cases of insects, which are bred in them. *Derham*.

(2.) **GALL**, in the animal economy, (§ 1. *def.* 1.) See BILE, § 1, and ANATOMY, § 300. Gall was generally given amongst the Jews to persons suffering death under the execution of the law, to make them less sensible of their pain; but gall and myrrh are supposed to have been the same thing; because at our Saviour's crucifixion, St Matthew says, they gave him vinegar to drink mingled with gall; whereas St Mark calls it wine mingled with myrrh. Perhaps they distinguished every thing bitter by the name of gall. The Greeks and Romans also gave such a mixture to persons suffering a death of torture. Many experiments have been made upon the gall of different animals, but few conclusions can be drawn from them with any certainty; as there must always be a considerable difference between the effects of acids, or other menstria, upon dead matter, and in the living system. Dr Percival, however, hath shown, that putrid bile may be perfectly corrected and sweetened by an admixture of the vegetable acids, vinegar, and juice of lemons. These, he observes, have this effect much more completely than the mineral ones; and hence, he thinks, arises the great usefulness of the vegetable acids in autumnal diseases; which are always attended with a putrescent disposition of the bile, owing to the heat of the preceding summer. He takes notice of a common mistake among physicians, who frequently prescribe elixir

of gallnuts are preternatural and accidental, produced on trees; but those of the

oak only are used in medicine. We have Oriental and European galls: the Oriental are brought from Aleppo, of the bigness of a large nutmeg, with tubercles on their surface, of a very firm texture, and a disagreeable, acerb, and astringent taste. It has been observed, that the oak does not produce galls in cold countries; but this observation should be confined to the medicinal galls; for all those excrescences which we call oak-apples, oak-grapes, and oak-cones, are true galls, though less firm in their texture. *Hill*.—Besides the acorns, the oak beareth galls, oak-apples, and oak-nuts. *Bacon's Nat. Hist.*—Malpighi, in his treatise of galls, under which name he comprehends all preternatural and morbose excrescences, demonstrates that all such excrescences, where any insects are found, are excited by some venenose liquor, which, together with their eggs, such insects shed. *Ray on Creation*.—The Aleppo galls, wherewith we make ink, are no other than cases of insects, which are bred in them. *Derham*.

of vitriol in those juice would be more effect of acids on see why the immo-ous to dis- tion gall should be it but as acids have perfectly mild and for they must be proportion-ably pernicious to the due concoction and assimilation of the food - which without an acid bile cannot be accom- d. Hence the body is deprived of its p- nourishment and support, the blood becomes rapid and watery, and a fatal cachexy unavoidably ensues. This has been the case with many unfortunate persons, who, in order to reduce their excessive corpulency, have indulged themselves in the too free use of vinegar. From the mild state of the gall in young children, Dr Percival also thinks it is, that they are so much troubled with acidities.

(3.) GALL, in natural history, (§ 1. def. 7.) denotes any protuberance, or tumour, produced by the puncture of insect, on plants and trees of different kinds. These galls are of various forms and sizes, and no less different with regard to their internal structure. Some have only one cavity, and others a number of small cells communicating with each other. Some of them are as hard as the wood of the tree they grow on, whilst others are soft and spongy; the first being termed *gall-nuts*, and the latter *berry galls*, or *apple-galls*. See CYNIPS. The external coat of the excreescence described above (§ 1. def. 7.) is dried by the air; and grows into a figure which bears some resemblance to the bow of an arch, or the roundness of a kernel. This little ball receives its nutriment, growth, and vegetation, as the other parts of the tree, by slow degrees, and is called the *gall-nut*. The worm, that is hatched under this spacious vault, finds in the substance of the ball, which is as yet very tender, a nourishment suitable to its nature; gnaws and digests it till the time of its transformation to a nymph, and from that state soon changes into a fly. After this, the insect disengages itself from its confinement, and takes its flight into the open air. The case, however, is different with respect to the *gall-nut* that grows in autumn. The cold weather frequently comes on before the worm is transformed into a fly, or before the fly can pierce through its inclosure. The nut falls with the leaves; but although it might now be supposed that the fly within is lost, yet in fact its being covered up so close is the means of its preservation. Thus it spends the winter in a warm house, where every crack and cranny of the nut is well stopped up; and lies buried under a heap of leaves, which preserve it from the injuries of the weather. This apartment, however, though so commodious a retreat in winter, is a prison in spring. The fly, routed out of its lethargy by the vernal heat, breaks its way through, and ranges where it pleases. A very small aperture is sufficient, as at this time the fly is but a diminutive creature. Besides, the rugnets whereof its body is composed - and become pliant in the passage. A very tiny of oak galls, put into a solution of water, though but very weak, gives it

a purple or violet colour: which, stronger, becomes black; and on it depends the art of making our writing the arts of dying and dressing leather manufactures. See INK. The best from Aleppo: these are not quite smooth like the other sorts, but tubercles on the surface. Galls have a styptic taste, without any smell; strong astringents, and as such have times made use of both internally and but are not much taken notice of in practice. Some recommend an ointment of galls and hog's lard as very effectual in painful states of hæmorrhoids; and that the internal use of galls has cures tents after the Peruvian bark has failed of galls with a bitter and aromatic has poised as a substitute for the bark.

(4.) GALL, ST, or ST GALLEN, a town in Switzerland, in the Upper Th a rich and celebrated abbey, whose ab- lar prince of the German empire, and the 72 Benedictines who compose He formerly possessed the sovereignty but the inhabitants shook off his au became independent; and the vari which since that period have arisen two rival parties have been compromi- terposition of their allies, the Swiss; town is entirely Protestant, and ment aristo-democratical. The sub- abbot, whose territory is distinct, ar- tholies. The abbey, in which this p is situated close to the town, and in its territory; as the latter is also entire- ed by the possessions of the prince. owes its flourishing state to the ur- dustry of the inhabitants, and to a v- commerce, arising chiefly from its man- huen, muslin, and embroidery. To l- lunging to the abbey, which is very n- well arranged, and which contains- of the classic writers, we are indebted- nus Arbiter, Silius Italicus, Valerius- Quantilian, copies of which were f- 1413. St Gallen is seated in a nar- valley, between two mountains; small streams, 37 miles NE. of Zi- 9. 22. E. Lat. 47. 26 N.

ALLA, a nation of Ethiopia, originally, as Mr Bruce supposes, under the line, using the profession of shepherds, which continue to do. For many years, they have been constantly migrating north-

though the cause of this migration is not. At first they had no horses; the reason was, that the country they came from knew these animals to breed; but as they went northward and conquered some of the provinces, they soon furnished themselves with such numbers, that they are now entirely cavalry, and make little account of them in their armies. On advancing to the north of Abyssinia, the multitude divided, and followed their course towards the Indian Ocean, after which, having made a settlement in the north part of the continent, they turned into the countries of Bali and Dawaw, and were entirely conquered, and settled there.

Another division having taken a westerly course, spread themselves in a semicircle along the banks of the Nile; surrounding the country, and passing eastward behind the country of the Nubians, extended their possessions as far as the banks of the Gongas and Gasats. Since the Nile has been the boundary of their empire; though they have frequently plundered, and sometimes conquered, the Abyssinian empire on the other side of the river, but have made no permanent settlement in these parts. The third division has settled to the S. of the country of Shoa, which the governor of that country has permitted, in order to form a barrier between him and the territories of the empire, whom he scarcely acknowledges any de-

pendence. The Galla are of a brown complexion, and have long black hair; but some of them who live in the valleys are entirely black. At first their common food was milk and butter; but since their intercourse with the Abyssinians, they have learned to plough and sow their land, and to make bread. They seem to have a predilection for the number 7, as each of the three divisions already mentioned are subdivided into seven tribes. In their behaviour they are extremely barbarous; and live in continual war with the Abyssinians, whom they murder without mercy as often as they fall into their hands. They cut off the privities of the men, and hang them up in their houses by way of trophies; and are so cruel as to rip up women with child, in hopes of thus destroying a male. Yet notwithstanding their excessive cruelty abroad, they live under the strictest discipline at home; and every broil or quarrel is instantly punished according to the nature of the offence. Each of the three divisions of the Galla has a king of its own; and they have also a kind of nobility, from among whom the sovereign can only be chosen: however, the commonalty are not excluded from rising to the rank of nobles, if they distinguish themselves very much in battle. None of the nobility can be elected till upwards of 40 years of age, unless he has with his own hand killed such a number of enemies, as added to his own age makes 40. There is a council of each of the 7 tribes, which meets separately in its own district, to settle how many are to be left behind for governing and cultivating the territory, and other matters of importance. These nations have all a great veneration for a tree which grows plentifully in their country, called *wanzey*, and which these superstitious people are even said to adore as a god. Their assemblies for the choice of a king are held under one of these trees; and when the sovereign is chosen, they put a bludgeon of this wood in his hand by way of sceptre, and a garland of the flowers upon his head. The Galla are reported to be very good soldiers, especially in cases of surprise; but, like most other barbarians, have no constancy nor perseverance after the first attack. They will, however, perform extraordinary marches, swimming rivers holding by the horse's tail, and are thus enabled to do very great mischief by the rapidity of their movements. They are excellent light horse for a regular army in an hostile country; but are very indifferently armed on account of the scarcity of iron among them. Their principal arms are lances made of wood sharpened at the end and hardened in the fire; and their shields are composed only of one single fold of bull's hide; so that they are extremely apt to warp by heat, or become too soft in wet weather. They are exceedingly cruel; and make a thrill horrid noise at the beginning of every engagement, which greatly terrifies the horses, and very often the barbarous riders which oppose them. The Galla are somewhat below the middle size, but extremely light and nimble. The women are fruitful; and suffer so little in child-bearing, that they do not even confine themselves for a single day after delivery. They plough, sow, and reap the corn, which is trodden out by the cattle; but the men have all the

the cattle in the fields. In their customs, filthy to the last degree; plaiting their round the guts of oxen, which they likewise round their middle, and which by the quick effect on occasion an abominable stench. They anoint their heads and whole bodies with grease; in which, as well as in other respects, they greatly resemble the Hottentots. It has been supposed that they have no religion whatever; but Mr Bruce is of opinion that this is a mistake. The wanzey, he says, is undoubtedly worshipped by all the three nations as a god; and they have likewise certain stones which are worshipped as gods. They also worship the moon, and some stars, when in certain positions, and at some particular seasons of the year. They all believe in a resurrection; and have some faint notions of a state of happiness, but no idea of future punishment. Some of them to the S. profess the Mahometan religion, but those to the E. and W. are generally pagans. They all intermarry with each other; but will not allow strangers to live among them, though the Moors have found out a method of trading safely with them. The commodities they deal in are blue Surat cloths, myrrh, and salt; the last being the most valuable article. The marriages among the Galla are celebrated with some of the disgusting customs of the Hottentots; and after these ceremonies the bridegroom promises to give the bride meat and drink while she lives, and to bury her when dead. Polygamy is allowed among them; the women solicit their husbands to take others to their embraces, that they may have numerous families of children, who may be capable of defending them against their enemies; as the Galla, according to Mr Bruce always fight in families, whether against foreign enemies or with one another.

(1.) GALLA, a town of Arabia, 24 miles SE. of Tadm.

(2.) GALLA, a town in Ceylon. See GALLU.

(3.) GALLAM, a kingdom of Africa.

(4.) GALLAM, the capital of the above kingdom, is seated on the Senegal. Lon. 9. 55. W. Lat. 14. 25. N.

(5.) GALLAN, or St GALLAN, an island of Peru.

GALLAND, Anthony, a learned antiquarian, member of the Academy of inscriptions, and professor of Arabic in the Royal College of Paris, was born of poor parents at Rollo, in Picardy. Having studied at the Sorbonne and other universities, he travelled into the east; where he acquired great skill in the Arabic tongue, and in the manners of the Mahometans. He wrote several works; the principal of which are, 1. An Account of the Death of the Sultan Osman, and the Coronation of the Sultan Mustapha. 2. A Collection of Maxims, drawn from the works of the Orientals. 3. A Treatise on the Origin of Coffee; and 4. he translated The Arabian Nights Entertainments.

(1.) * GALLANT. *adj.* [*galant*, French, *gala*, fine dress, Spanish.] 1. Gay; well dressed; showy; splendid; magnificent.—A place of broad rivers, wherein shall go no gally with oars, neither shall gallant ships pass thereby. *If.* xxxiii. 22.

The gay, the wife, the gallant, and the grave, Subdu'd alike, all but one passion have. *Walker.* 2. Brave; high spirited; daring; magnanimous.

—Scorn, that any should kill his uncle, & seek his revenge in manner gallant enough! But, fare thee well, thou art a gallant.

—A gallant man, whose thoughts fly at every game, requires no further insight. *D.* Fine; noble; spacious.—

There are no tricks in plain and simple; But hollow men, like horses hot at hand, Make gallant shew and promise of the

4. Courty with respect to ladies.—He did how gallant and how brave a thing it was for his highness to make a journey into Sicily to fetch home his mistress. *Clarendon.*—

When first the soul of love is sent abroad, The gay troops begin In gallant thought to plume their pains.

(2.) * GALLANT. *n. f.* [from the *a.* 1. A gay, sprightly, airy, splendid man. The new proclamation.

—What is't for? —The reformation of travel'd gallants That fill the court with quarrels, talk and lous.

—The gallants and lusty youths of Naples offered themselves unto Vassius. *Kn.* The gallants, to protect the lady's Their fauchions brandish'd at the grill.

Gallants, look to't, you say they are sprightly. But I'll come dance about your beds.

5. A whoremaster, who caresses women and bauch them.—One, worn to pieces, shews himself a young gallant. *Shak.*—left the good-man at home, and brought her gallant. *Spektator.* 3. A wooer; courts a woman for marriage. In the senses it has commonly the accent on syllable.

(3.) GALLANT, in geography, a town, 3 miles SSW. of Serat.

* GALLANTLY. *adv.* [from *gall* Gayly; splendidly. 1. Bravely; nobly. —You have not dealt so gallantly as we did with you in a parallel case: li paper was brought here from England, ordered to be burnt by the common *Swiss.*

* GALLANTRY. *n. f.* [*galanterie*, 1. Splendour of appearance; show; magnificent grandeur; ostentatious finery.

Make the sea shine with gallantry. The English youth flock to their admirer. 2. Bravery; nobleness; generosity.—nence of your condition, and the gallant principles, will invite gentlemen to the sunobling study of nature. *Glanville's S.* A number of gallants.—Hector, Deiphobus all the gallantry of Troy, I would have day. *Shak.* 4. Courtship; refined address.—

The martial Moors in gallantry ref Invent new arts to make their charms

love; lewdness; debauchery.—It looks of compounding between virtue and a woman were allowed to be vicious, he be not a profligate; as if there were joint where gallantry ends, and infamy vists.

ARATO, a town of the Cisalpine republic department of Olone, and late duchy 20 miles WNW. of Milan.

ARDON, a town of France, in the dept. of Eure and Loire, 12 miles W. of and 4 NE. of Chartres.

BLADDER. See **ANATOMY**, *Index*.

ALLE, the name of several engravers, of principal was Cornelius, who flourished 1600. He learned the art of engraving at Rome, and imitated his stiff style, till he came, where he resided a considerable time, there acquired that freedom, taste, and skill of drawing which are found in his best works. He settled at Antwerp upon his return, where he carried on a considerable business in prints. His best prints are those done there.

ALLE, or **PORT GALLE**, a sea-port town on the SW. coast of Ceylon. It was taken from the Portuguese in 1640; and by the British in Feb. 1796. See **CEYLON**. It is 98 miles S. of Candy. Lon. 80. 20. E. Lat. 6. 0. N.

GALEAS. *n. f.* [*galcas*, French.] A heavy vessel, with both sails and oars. It carries many masts, but they cannot be lowered, as in a galley. It has thirty-two seats for rowers, and seven slaves to each. To carry three masts at the head, and at the stern there are many of guns. *Diff.*—The Venetians pretend to set out, in case of great necessity, thirty galley war, a hundred galleys, and ten galleys on Italy.—

My father hath no less three great argosies, besides two galleasses, and twelve tight gallies. *Shak.*

ALLEGRO, a river of Spain, which rises in the mountains, and runs into the Ebro opposite.

ALLEGRO, a town of Spain, in the prov. of 18 miles SSE. of Salamanca.

ALMBERG, a town of Germany, in Carinthia, 10 miles E. of Laubach.

ALNEK, a town of Germany, in Carniola, 10 miles SE. of Stein.

ALNSTADT, a town of Germany in Styria, 10 miles W. of Reiffing.

GALLEON. *n. f.* [*galion*, Fr.] A large ship of 4 or sometimes 5 decks, now in use only by the Spaniards.—I assured them that I would stay for them at Trinidad, and that no wind could drive me thence, except I were sunk by the Spanish galleons. *Raleigh.*—The number of vessels were 130, whereof galleasses 72, goodly ships, like floating tow-ers. *Bacon's War with Spain.*

GALLEONS are employed in the Spanish India trade. The Spaniards send annually 2; the one for Mexico, which they call the *flota*; and the other for Peru, which they call the *flota*. See **FLOTA**, N° 1. By a general law made in Spain, it has been established,

that there should be 12 men of war and 5 tenders annually fitted out for the armada or galleons; 8 ships of 600 tons burden each, and 3 tenders, one of 100 tons, for the island Margarita, and two of 80 each, to follow the armada; for the New Spain fleet, two ships of 600 tons each, and two tenders of 80 each; and for the Honduras fleet, two ships of 500 tons each: and in case no fleet happened to sail any year, 3 galleons and a tender should be sent to New Spain for the plate. They sail from Cadiz in January, that they may arrive at Porto Bello in April; where, the fair being over, they may take aboard the plate, and be at Havannah with it about the middle of June; where they are joined by the flota that they may return to Spain with the greater safety.

GALLEOT. See **GALLOT**. All the seamen on board a galleot are soldiers, and each has a musket by him.

(1.) * **GALLERY**. *n. f.* [*galerie*, French; derived by *Du Cange* from *galeria*, low Latin, a fine room.] 1. A kind of walk along the floor of a house, into which the doors of the apartments open; in general, any building of which the length much exceeds the breadth.—In most part there had been framed by art such pleasant arbors, that, one with another, they became a gallery aloft from tree to tree, almost round about, which below gave a perfect shadow. *Sidney.*—

High lifted up were many lofty towers,
And goodly galleries fair overlaid. *Spenser.*
Your gallery

Have we pass'd through, not without much content. *Shak.*
—The row of return on the banquet side, let it be all stately galleries, in which galleries let there be three cupolas. *Bacon.*

A private gallery 'twixt th' apartments led,
Not to the foe yet known. *Denham.*

—Nor is the shape of our cathedrals proper for our preaching auditories, but rather the figure of an amphitheatre, with galleries gradually overlooking each other; for into this condition the parish churches of London are driving apace, as appears by the many galleries every day built in them. *Graunt.*

—There are covered galleries that lead from the palace to five different churches. *Addison on Italy.*
2. The seats in the playhouse above the pit, in which the meaner people sit.—

While all its throats the gallery extends,
And all the thunder of the pit ascends. *Pope.*

(2.) **GALLERY**, in gardening, an ornament made with trees of different kinds. Galleries are very common in the French gardens, but are seldom introduced into the British ones, especially since the taste for clipped trees has been exploded. For those, however, who may still choose to have them, Mr Miller gives the following directions. In order to make a gallery in a garden with porticoes and arches, a line must first be drawn of the length you design the gallery to be; which being done, it is to be planted with hornbeam; as the foundation of the gallery. The management of galleries is not difficult. They require only to be digged round about; and sheared a little when there is occasion. The chief curiosity is in the ordering the fore part of the gallery, and in forming the arches.

ches. Each pillar of the porticoes or arches ought to be 4 feet distant from one another, and the gallery 12 feet high and 10 feet wide, that there may be room for 2 or 3 persons to walk abreast. When the hornbeams are grown to the height of 3 feet, the distance of the pillars well regulated, and the ground work of the gallery finished, the next thing to be done is to form the frontispiece; to perform which, you must stop the hornbeams between two pillars for that purpose, which forms the arch. As it grows, cut off those boughs which outshoot the others. In time they will grow strong, and may be kept in form by the sheers. Portico galleries may be covered with lime trees.

(3.) GALLERY, in a ship, that beautiful frame, which is made in the form of a balcony, at the stern of a ship without board; into which there is a passage out of the admiral's or captain's cabin, and is designed for the ornament of the ship.

(4.) GALLERY, in fortification, a covered walk across the ditch of a town, made of strong beams covered with planks, and loaded with earth: sometimes it is covered with raw hides, to defend it from the artificial fires of the besieged.

(5.) GALLERY OF A MINE is a narrow passage or branch of a mine carried on under ground to a work designed to be blown up. See MINE.

GALLESE, a town of Italy in the province of Patrimonio, 25 miles N. of Rome.

* GALLETYLE. *n. f.* I suppose this word has the same import with *gallipot*.—Make a compound body of glass and *gallestyle*; that is, to have the colour milky like a chalcedon, being a stuff between a porcelain and a glass. *Bacon*.

(1.) * GALLEY. *n. f.* [*galea*, Ital. *galere*, Fr. derived, as some think, from *galea*, a helmet, pictured anciently on the prow; as others from *γαλῆρας*, the swordfish; as others from *galleon*, expressing in Syriac men exposed to the sea. From *galley* come *galleassi*, *galleon*, *galios*; 1. A vessel driven with oars, much in use in the Mediterranean, but found unable to endure the agitation of the main ocean.—

Great Neptune grieved underneath the load
Of ships, hulks, *galles*, barks, and brigandines.

Fairfax.

—In the ages following, navigation did every where greatly decay, by the use of *galles*, and such vessels as could hardly brook the ocean. *Bacon's New Atlantis*.—Jason ranged the coasts of Asia the Less in an open boat, or kind of *galley*. *Raleigh's History*.—

On oozy ground his *galles* moor;

Their heads are turn'd to sea, their stems to shore.

Dryden.

2. It is proverbially considered as a place of toil-some misery, because criminals are condemned to row in them.—The most voluptuous person, were he tied to follow his hawks and his hounds, his dice and his courtships every day, would find it the greatest torment that could befall him: he would fly to the mines and the *galles* for his recreation, and to the spade and the mattock for a diversion from the misery of a continual uninterrupted pleasure. *South*.

(2.) GALLEYS are low flat-built vessels, furnished with one deck, and navigated with sails and oars. The largest sort are employed only by

the Venetians. They are commonly 161 feet above, and 133 feet by the keel: 31 feet 3 with 23 feet length of stern post. They are furnished with three masts, and 31 banks of oars, every bank containing two oars and every oar managed by 6 or 7 seven slaves, who are usually chained thereto. In the fore part they have 3 little batteries of cannon, of which the lower of two 16 pounders, the 2d of two 24 pounders and the uppermost of 2 two-pounders: the 31 pounders are also planted on each quarter, complement of men for one of these galleys 1000 or 1200. They are esteemed very competent for bombarding or making a descent upon an enemy's coast, as drawing but little water, having by their oars frequently the advantage of a ship of war, in light winds or calms, by reaching the latter near the surface of the sea, by scouring her whole length with their shot at the same time keeping on her quarter on so as to be out of the direction of her cannon. The galleys next in size to these, which are called *half galleys*, are from 120 to 130 feet 18 feet broad, and 9 or 10 feet deep. They have two masts, which may be struck at pleasure, are furnished with two large lateen sails, and pieces of cannon. They have commonly 21 of oars. A size still less than these are called *petty galleys*, carrying from 12 to 16 banks of oars. There are very few galleys now besides those in the Mediterranean, which are found by experience to be of little utility except in fine weather, a circumstance which renders their service extremely precarious. They generally keep close under shore, but sometimes venture out to sea to form a summer cruise.

GALLEY-HEAD, a promontory of Ireland on the coast of Cork, on the extremity of which is Dundee Castle. This is sometimes fatally taken by sailors, for the Old Head of Kinsale, the light of the latter is not seen. It lies 10 SSW. of Bandon bridge. Lon. 8. 54. W. 51. 31. N.

* GALLEY-SLAVE. *n. f.* [*galley* and *slave*] a man condemned for some crime to row in the galley.—As if one chain were not sufficient to poor men, he must be clogged with innumerable chains: this is just such another freedom as Turkish *galley-slaves* do enjoy. *Bramble*.—Heed *galley-slaves* despise manumission. *Dec. of*

The turges gently dash against the shore
Flocks quit the plains, and *galley-slaves* their

Galley

GALLEY-WORM, in zoology. See LULUS.

GALL-FLY, in entomology. See CYNIPID.

(1.) GALLI, in antiquity, a name given to priests of Cybele, from the river Gallus in Phrygia; but of the etymology of the name we have no certain account. All that we learn about them is, that they were eunuchs and Phrygians, and in their solemn processions they danced, bare drummed, cut and slashed themselves, played tumblers, pipes, cymbals, &c. and driving asses loaded with the sacred trumpery of the deity. When a young man was to be initiated, he was to throw off his clothes, run crying to the midst of their troop, and there with sword and castrate himself; after this he was

the street with the parts cut off, in his row them into some house, and in the life put on a woman's dress. These priests names also of *Cætes*, *Corybantes*, and The chief priest was called *Archi-Gallus*. Her of priesthood is found both amongst and Romans. See *Lucret.* lib. ii. and *Juv.*

GALLI, the Gauls. See **GALLIA** and

GALLI, five small desolate islands on the the *Principato Citra* of Naples. They used to be the *Syræusæ*, or islands once called by the Sirens, which Ulysses passed with caution and hazard. Great revolutions, have been occasioned in their shape, size, number, by the effects of subterranean fire; learned persons go so far as to assert, the rocks have risen from the bottom of the Homer's time; consequently, that those who dwelt on some other spot, probably *Sic-Capri*. The tradition of Sirens residing there is very ancient and universally admitted what they really were, divested of their and poetical disguise is not easy to discover **SIREN**. The *Syræusæ* were only three in number; and therefore if these and the *Galli* name, two more must have since risen, or they have been split into five by a subterranean convulsion. On the largest is a watch-tower, and the next has a deserted hermitage. The island is only a narrow semicircular ridge with a shallow coat of soil; two other little islands, and some jagged rocks just peeping above the waves, correspond with this one so as to form the outline of a volcanic crater. The composition of them all is at top a calcareous rock extremely shaken, tumbled, and confused, mixed with masses of breccia, disposed in a most irregular manner; below these is lava, and the deeper you follow it the stronger are the marks of how the surface of the water, and in some places above it, the layers are complete blocks of lava. Hence we may presume, that central fire heaved up to light the torrifed substance originally lay near their focus, with all the strata that covered them from the time the layers incline downwards from E. to W. the air seems to have forced its way into the mass while in fusion, and by checking the sintering caused many large caverns to be left in these islands are uncultivated and uninhabited. The old hermit of St Antonio died. Myrrors most of the surface.

GALLIA, in ancient geography, a large country in Europe, called *GALATIA* by the Greeks. The inhabitants were called **GALLI**, *CELTÆ*, *CELTÆ*, and *Celtescythæ*. Ancient Gaul was divided into 4 different parts by the Romans, called *Gallia Belgica*, *Narbonensis*, *Aquitania*, and *Cisalpine*. Though Julius Cæsar divides it only into *Belgica* and *Cisalpine*. Besides these grand divisions there is often made of *Gallia Cisalpina* or *Citerior*, and *Gallia Transalpina* or *Uterior*, which last comprehended the whole of Gaul, properly so called, as possessed by the ancient Gauls. The inhabitants were brave warriors, and overcame the Roman army at the city of Rome, and invaded Greece

in different ages. They spread themselves over the greatest part of the world. They were very superstitious in their religious ceremonies, and revered their priests as if they had been gods. They long maintained bloody wars against the Romans, and Cæsar resided 10 years in their country before he could entirely subdue them. See **GAUL**.

1. **GALLIA AQUITANICA** contained the late provinces of *Poitou*, *Saintonge*, *Guienne*, *Berry*, *Limousin*, *Gascogne*, *Auvergne*, &c. and was situated between the *Garumna*, the *Pyrenean mountains*, and the ocean.

2. **GALLIA BELGICA** was the largest province, bounded by Germany, *Gallia Narbonensis*, and the German ocean; and contained the modern countries of *Alsace*, *Lorraine*, *Picardy*, with part of the *Low Countries*, of *Champagne*, and of the *isle of France*.

3. **GALLIA CELTICA**, or **LUGDUNENSIS**, was bounded by Belgium, *Gallia Narbonensis*, the *Alps*, and the ocean. It contained the countries heretofore known by the names of *Lyonnois*, *Touraine*, *Franche Comté*, *Senenois*, *Switzerland*, and part of *Normandy*. It was also called *Comata*, because the people suffered their hair to grow to an uncommon length.

4. **GALLIA CISALPINA**, or **CITERIOR**. By these names the Romans understood that part of Gaul which lies in Italy, on this side of the *Alps*, in regard to the inhabitants of Rome. They also styled it *Gallia Togata*, because the Roman gowns called *toga* were worn by the people. It is now chiefly comprehended in the **CISALPINE REPUBLIC**.

5. **GALLIA CISPADANA** was applied to a part of Italy conquered by some of the Gauls; and meant the country on this side of the *Po*, with respect to Rome. See **CISPADANA**.

6. **GALLIA NARBONENSIS**, which contained the provinces lately called *Languedoc*, *Provence*, *Dauphiné*, and *Savoy*, was bounded by the *Alps* and *Pyrenean mountains*, by *Aquitania*, Belgium, and the *Mediterranean*. *Gallia Narbonensis* was called *Braccata*, on account of the peculiar covering of the inhabitants for their thighs.

7. **GALLIA TRANSALPINA**, or **ULTERIOR**, was the name given by the Romans to that part of Gaul, which lay beyond the *Alps*, in regard to Rome.

8. **GALLIA TRANSPADANA**, was the name given to that part of Italy, conquered by the Gauls, which lay beyond the *Po*, in respect of Rome.

GALLIANO, a town of the Cisalpine republic, in the dept. of *Montagna*, and ci-devant duchy of *Milan*, 6 miles SSE. of *Como*.

(1.) * **GALLIARD**. *n. f.* [*gaillard*, French; imagined to be derived from the Gaulish *ard*, genius; and *gay*.] 1. A gay, brisk, lively man; a fine fellow.—

Selden is a galliard by himself. *Cleaveland*.
2. An active, nimble, spritely dance. It is in both senses now obsolete.—I did think, by the excellent constitution of thy leg, it was form'd under the star of a galliard. *Shakespeare's Twelfth Night*.—

There's nought in France
That can be with a nimble galliard won:
You cannot revel into dukedoms there. *Sh. H. V.*
—If there be any that would take up all the time,
let him find means to take them off, and bring o-

thers

use to do with those that
Bacon.—The triplas and

 in the medley of one dance. *Bacon*.
 * *GALLIARDA*, (*g* 1, *def* 2.)
 iently in great request, con-
 motions and actions, some-
 times along the room,
 and sometimes along the room.
 It was also called *Roman-
 esque*, because brought from Rome. *Thomas Ar-
 beau*, in his *Orchesography*, describes it as con-
 sisting of 5 steps and 5 positions of the feet, which
 the dancers performed before each other, and
 whereof he gives us the score or tablature, which
 is of six minims and two triple times.

GALLIARDA, in the Italian music, a tune
 that belongs to the dance, called *GALLIARD*. The
 air of it is lively in triple time.

* *GALLIARDISE*. *n. f.* [French.] Merriment;
 exuberant gaiety. Not in use.—At my nativity
 my ascendant was the watery sign of Scorpius; I
 was born in the planetary hour of Saturn, and I
 think I have a piece of that leaden planet in me:
 I am no way facetious, nor disposed for the mirth
 and *galliardise* of company. *Brown's Rel. Med.*

GALLIC, or } *adj.* belonging to, or origina-
GALLICAN, } ting from France.

* *GALLICISM*. *n. f.* [*gallicisme*, French; from
gallicus, Latin.] A mode of speech peculiar to the
 French language: such as, he *figured* in contro-
 versy; he *beld* this conduct; he *beld* the same lan-
 guage that another had *beld* before: with many
 other expressions to be found in the pages of *Be-
 dingbroke*.—In English I would have *Gallicisms* a
 voided, that we may keep to our own language,
 and not follow the French mode in our speech.
Pelton on the Classes.

GALLICO, a town of Naples, in Calabria Ul-
 tra, 5 miles N. of Reggio.

* *GALLIGASKINS*. *n. f.* [*Galige Gallo-Vas-
 conum*. *Skinner*.] Large open hose. Not used but
 in ludicrous language.—

My galligaskins, that have long withstood
 The Winter's fury, and encroaching frosts,
 By time subdu'd, what will not time subdue,
 An horrid chasm disclose. *Philips.*

* *GALLIMATIA*. *n. f.* [*galimatias*, French.]
 Nonsense; talk without meaning.

* *GALLIMAUFTRY*. *n. f.* [*galimaufree*, Fr.]
 1. A hoch-poch, or haph of several sorts of broken
 meat; a medley. *Hanmer*.—They have made of
 our English tongue a *gallimauftry*, or hodge podge
 of all other speeches. *Spenser*. 2. Any inconsis-
 tent or ridiculous medley.—They have a dance,
 which the wenches say is a *gallimauftry* of gam-
 bols, because they are not in't. *Shak. Wint. Tale*.
 —The painter who, under pretence of diverting
 the eyes, would fill his picture with such varieties
 as alter the truth of history, would make a ridi-
 culous piece of painting, and a mere *gallimauftry*
 of his work. *Dryd. Duf.* 3. It is used by *Shake-
 speare* ludicrously of a woman.—

Sir John affects thy wife.
 —Why, sir, my wife is not young.
 —He wooes both high and low, both rich and poor;
 loves thy *gallimauftry*, friend. *Shak.*

GALLINACEOUS, *adj.* an appella-
 to the birds of the order of the gallinæ.

GALLINACEUS LAPIS, a glossy sub-
 duced by volcanic fires; the same with
obsidianus of the ancients. A species of it
 from Paris, of a beautiful black, refer
 colour of a large crow, in that coun
gallinago.

though not without a most humble advertisement
at the beginning, wherein he declared, that the
author "would not presume to criticise, but sim-
ply give an account of the books." This, with
the protection of M. Colbert, reconciled the pub-
lic to it: and thus began literary journals, which
have been continued from that time to this, under
various titles, and by various writers. Gallois
continued his journal to 1674, when more import-
ant occupations obliged him to turn it over to o-
ther hands. M. Colbert had taken him into his
house to teach him Latin; and when he lost his
patron in 1683, he was first made librarian to the
king, and then Greek professor in the royal college.
He died in 1707.

GALLO-MANIA, *n. f.* [from *Gallia*, France;
and *mania*, madness.] a new word, which owes its
origin to the present political ferment in public
opinion: used in contempt respecting the opinions
of those who are supposed to be infected with the
principles now generally prevailing in France; as
to religion or government. It might have been
long ago applied to the general taste among the
higher ranks, for French fashions, French cook-
ery, the affectation of French words and phrases,
&c. in preference to English.

(1.) * GALLON. *n. f.* [*gelo*, low Latin.] A
liquid measure of four quarts.—Beat them into
powder, and boil them in a gallon of wine, in a
vessel close stopped. *Wise man's Surg.*

(2.) GALLON is a measure of capacity both for
dry and liquid things, but differs according to the
quality of the thing measured: For instance, the
wine gallon contains 231 cubic inches, and holds
8lb. avoirdupois of pure water; the beer and ale
gallon contains 281 solid inches, and holds 10lb.
3¼ oz. avoirdupois of water; and the gallon for
corn, meal, &c. 272¼ cubic inches, and holds 9lb.
13 oz. of pure water.

* GALLOON. *n. f.* [*galon*, French.] A kind of
close lace, made of gold or silver, or of silk alone.

* GALLOP. *n. f.* [from the verb.] The motion
of a horse when he runs at full speed; in which,
making a kind of a leap forwards, he lifts both
his forelegs very near at the same time: and while
these are in the air, and just upon the point of
touching the ground, he lifts both his hind legs al-
most at once. *Farrier's Dict.*

* To GALLOP. *v. n.* [*galoper*, French. Deri-
ved by all the etymologists, after *Budew*, from
καλπαζω; but perhaps it comes from *gant*, all;
and *lopen*, to run, Dutch; that is, to go on full
speed.] 1. To move forward by leaps, so that all
the feet are off the ground at once.—

I did hear

The galloping of horse: who was't came by?

Shak Macb

His steeds will be restrain'd,

But gallop lively down the western hill. *Donne*.

In such a shape grim Saturn did restrain
His heav'nly limbs; and flow'd with such a mane;
When half surpriz'd, and fearing to be seen,
'The leacher gallop'd from his jealous queen.

Dryden's Virgil:

2. To ride at the pace which is performed by leaps.
—Seeing such streams of blood as threatened a
drowning life, we galloped toward them to part
them. *Sidney*.—

B d

They

They 'gan espy
An armed knight towards them gallop fast,
That seemed from some feared foe to fly. *F. G.*
—He who to r and softly goes steadily forward, in
a course that points right, will sooner be at his
journey's end, than he that runs after every one
he meets, though he gallop all day full speed.
Locke. 3. To move very fast.—

The golden sun
Gallop the zodiack in his g'rt'ring coach. *Sb.*
Whom doth time gallop withal?
—With a thief to the gallows. *Sbak.*
—He that rides post through a country may, from
the transient view, tell how in general the parts lie:
such superficial ideas he may collect in galloping
over it. *Locke.*

(1.) * GALLOPER. *n. f.* [from *gallop*.] 1. A
horse that gallops.—Mules bred in cold countries
are much better to ride than horses for their walk
and trot: but they are commonly rough gallopers,
though some of them are very fleet. *Morr. Husb.*
2. A man that rides fast, or makes great haste.

(2.) GALLOPER, in military, is the name of a
carriage, which carries a pound and a half gun.
This carriage has 12 lbs so as to be drawn without
a limber, and is thought by some to be more con-
venient and preferable to other field carriages;
and it may likewise serve for our light three and
six pounders.

GALLOTS, ISLE AUX, an island of Canada,
in the St Lawrence. Lat. 43. 33 N.

GALLUS, *n. f.* See GALLOWES.
* To GALLOW. *v. a.* [*agel-wan*, to fright, Sax.]
To terrify, to fright.—

The wrathful skies
Gallow the very wand'ers of the dark,
And make them keep their caves. *Sbak. K. L.*
(1.) GALLOWAY, in geography, a county of
Scotland, which is divided into two districts; the
western, called *Upper*, and the eastern, *Lower*.

1. GALLOWAY, LOWER, or the Stewartry of
Kirkcudbright. See KIRKCUDBRIGHT.

2. GALLOWAY, UPPER, or the county of Wig-
ton. See WIGTON.

(II.) GALLOWAY, a township of New Jersey,
in Gloucester county.

(III. 1.) * GALLOWAY. *n. f.* A horse not more
than fourteen hands high, much used in the North;
probably as coming originally from Galloway, a
shire in Scotland.

(II.) GALLOWAY, in zoology. Tradition re-
ports that this kind of horses sprung from some
Spanish stallions, which swam on shore from some
of the ships of the famous Spanish armada,
wrecked on the coast; and coupling with the
mares of the country, furnished the kingdom
with their posterity. They are much esteemed,
and of a middling size, strong, active, nervous,
and hardy.

(IV.) GALLOWAY. See GALWAY, N° 1.
(V.) GALLOWAY, MULL OF, the south cape or
promontory of all Scotland, in the county of Gal-
loway, on the Irish sea. Lon. 1. 43. W. of Edin-
burgh. Lat. 54. 44. N.

(VI.) GALLOWAY, NEW, a town of Scotland,
in Kirkcudbrightsh. near the Ken, 15 miles N. of
Kirkcudbright.

* GALLOWGLASSES. *n. f.* 1. It is worn like-

wife of footmen under their shirts
which footmen the Irish call *galla*
which name doth discover them also
English; for *gallogla* signifies an Ei-
or yeoman. And he being so arm-
shirt of mail, down to the calf of h
long broad ax in his hand, was the
armature; and was instead of the

GALLULADI, a town of Sw
Gothland, 10 miles E. of Gothenb
(1.) GALLUS, Cornelius, an a-
poet, born at Forum Julium, in t-
a particular favourite with August-
made him governor of Egypt: bu

in there occasioned his banishment and the loss of his estate; for grief of which he put an end to his life. He wrote 4 books of love elegies; Virgil has complimented him in many places. **GALLUS**, the Cock, in ornithology. See **INDEX**.

GALLUS, a river of Phrygia.

GALLEY, in printing, a frame into which the compositor empties the lines out of his composing stick in which he ties up the page when it is set. The galley is formed of an oblong board, with a ledge on three sides, and is used to admit a false bottom called a *galley slice*. See **GALLEY-HEAD**.

NEIKIRCHEN, a town of Austria.

OMBATZ, a town of Servia, 20 miles S. of Orsova.

OPINA, in botany, a genus of the digynia class, belonging to the tetrandria class of plants.

OVSKOI, a fort of Russian Siberia.

OWAH, or **GHALVAN**, a town of Africa, on the Nile.

ALSTON, a parish of Scotland, in Ayrshire, 10 miles long, and from 4 to 5 broad. The soil is mostly light and gravelly, partly rich clay. The climate is moist but healthy. The quantity of arable acres is 7,200. Oats are the principal produce; peas, beans, potatoes, wheat, and barley are also cultivated. There are many fine old oaks, particularly very large firs in the parish.

The elm measures 24 feet round, 12 feet of the top, and spreads into 24 branches, which is itself a large tree. Great quantities of excellent cheese are made, and about 1000 flax are annually manufactured in the parish. The population, in 1790, stated by the Rev. Mr. Smith, in his report to Sir J. Sinclair, was 1,200 and had increased 564 since 1755. The number of sheep was above 2,600. There are several retreats of Sir William Wallace, in the parish, some of which still bear the name of the patriot. See **BEG**, N° 1; **WALLACE**.

There are 3 lint mills, 1 paper mill, and 1 mill in the parish. One of these last, seat- ing Irvine, is called *Patie's Mill*, and claims credit of having given birth to Ramsay's cele- brated *The Lass of Patie's Mill*.

ALSTON, a flourishing village in the above parish, (N° 1.) seated on the great roads from Edinburgh to Ayr, and from Glasgow to Dumfries, passing through it. The population, in 1790, was 1,200. It has two great fairs, in July and August, and in the evening before St Peter's fair fires are lighted on all the adjacent hills.

ALLA, a town of Sardinia, 14 miles S. of Cagliari.

GAULTIES, or **GAULTIES**, mountains of Ireland, in the counties of Limerick, Tipperary, and Cork.

ELECTRICITY. See **ELECTRICITY**, *Index*.

ALENTEJO, a town of Portugal, in Alentejo; 10 miles N.W. of Estremoz.

GALLOWAY, or **GALLOWAY**, a county of the province of Connaught, 76 miles long, from E. to W. and 40 broad; bounded by the counties of Clare, Tipperary, King's County, and the sea. The Shannon washes the E. and SE. and forms a lake

several miles long. The county contains 17 baronies, 13 boroughs; 28 churches, 116 parishes, about 28,200 houses, and 142,000 souls. The climate is warm and the soil fertile. The chief towns are Galway, (N° 2.) Tuam, Ballinasloe, and Loughrea. Before the Union with Great Britain, this county sent 2 representatives to parliament, for itself, and 6 from the boroughs.

(2.) **GALWAY**, the capital of the above county, (N° 1.) is surrounded with strong walls, has large straight streets, and the houses are built of stone. It has a good trade into foreign parts, on account of its harbour, which is defended by a fort. It is governed by a mayor, sheriffs, and recorder; and, before the Union, returned two members to parliament. It has but one parish church, which is a large and beautiful Gothic structure; an exchange; barracks for 10 companies of foot, a charter school, and an hospital. It was one of the strongest towns in the kingdom: it held out some time against General Ginkle, who invested and took it after the battle of Aughrim. Its fortifications were then repaired; the walls are flanked by bastions, but are mostly decayed. The salmon and herring fisheries are carried on here with great spirit, and employ 700 boats; the quantity of kelp manufactured and exported is considerable; and the linen manufacture, is important. In 1296, Sir William de Burgh founded a monastery here for Franciscan friars, on St Stephen's island, situated without the N. gate of the town. His tomb was discovered in June 1779, 4 feet under ground, with his family arms, and a very long broad sword, elegantly carved thereon. Near the W. gate of the town, without the walls, was the monastery of St Mary of the hill. There are no remains of it except the cemetery; the building having been demolished by the townsmen, in 1652, to prevent Cromwell from turning it into a fortification. This town is seated on the bay of Galway, 49 miles WSW. of Athlone, and 96 W. of Dublin. Lon. 8. 58. W. Lat. 53. 15. N.

(3.) **GALWAY**, a township of New York, in the county of Saratoga.

(4.) **GALWAY BAY**, a large bay of the Atlantic, on the W. coast of Ireland; 20 miles long and 7 broad. The N. side of it is dangerous for ships.

GAMA, Vasco DE, a Portuguese admiral, celebrated for his discovery of the East Indies by the Cape of Good Hope, was born at Synes; and, in 1497, was sent to the Indies by king Emanuel: he returned in 1502, and sailed thither again with 13 vessels richly laden. He was made viceroy of the Indies by king John III; and died at Cochin on the 24th Dec. 1525. Stephen and Christopher De Gama, his sons, were also viceroys of the Indies, and celebrated in history.

GAMACHES, a town of France, in the dep. of Somme, 12 miles SW. of Abbeville.

GAMBACH, a town of Germany, in the principality of Solms Braunfels, 2 m. W. of Munzenberg.

* **GAMBADE**. } n. f. [*gamba*, Italian, a leg.]

* **GAMBADO**. } Spatterdashes; boots worn upon the legs above the shoe.—The pettifogger ambles to her in his *gambadoes* once a week. *Dennis's Letters*.

GAMBAIS, a town of France, in the depart. of Seine and Oise; 3 miles E. of Houdan.

IMBOUTO, a town of the dep. of Tessino, and cit. 12 miles from Vigevano. It is one of the Cisalpine republic, near Po, and is devant Cremona.

META, a town of the Cisalpine republic, seated on the Naviglio, 18 miles from Milan. It had 2000 citizens, in 1797. **MBA**, a town or district of the Cisalpine republic, in the dep. of the Mela, on the confines of Mantua; containing 3 parishes, and 4000 citizens.

(1.) **GAMBARÈ**, a district of Maritime Austria, in the Dogado, W. of Venice, extending from the banks of the lakes to the Paduan. The soil is fertile, but the climate is not healthy.

(2.) **GAMBARÈ**, a village in the above district, (N. 1.) on the Brenta. It has a chapel on the ruins of the abbey of St Ilario.

GAMBARO, a town of Italy, in the duchy of Parma, 24 miles S. of Piacenza.

GAMBASCA, a town of Italy, in Piedmont, and in the marquise of Saluzzo, on a rivulet which runs into the Po 6 miles W. of Saluzzo.

(1.) **GAMBIA**, a country of Africa, ceded to Britain by the peace, in 1783.

(2.) **GAMBIA**, a large river of Negroland in Africa, generally supposed to be a branch of the Niger. See **NIGER**, **NILE**, and **SENEGAL**.

GAMBINA, a river of Italy, in the Cisalpine republic, and department of Upper Po.

* **GAMBLER**. *n. f.* [A cant word, I suppose, for *game* or *gamester*.] A knave whose practice is to invite the unwary to game and cheat them.

GAMBLE'S STATION, a fort of the United States, in Tennessee, 12 miles from Knoxville.

(1.) * **GAMBOGE**. *n. f.* *Gamboge* is a concentrated vegetable juice, partly of a gummy, partly of a resinous nature, heavy, of a bright yellow colour, and scarce any smell. It is brought from America and the East Indies, particularly from Cambaja, or Cambogia. *Hill*.

(2.) * **GAMBOGE** is partly of a gummy, and partly of a resinous nature. See **CAMBOGIA**. It is chiefly brought to us in large cakes or rolls from Cambaja in the East Indies. The best sort is of a deep yellow or orange colour, breaks shining and free from dross: it has no smell, and very little taste, unless kept in the mouth for some time, when it impresses a slight sense of acrimony. It immediately communicates to spirit of wine a bright golden colour, and almost entirely dissolves in it; Geoffroy says, except the sixth part. Alkaline salts enable water to act upon this substance powerfully as a menstruum; the solution is somewhat transparent, of a deep blood red colour, and passes the filtre: the dulcified spirit of sal ammoniac readily and entirely dissolves it, and takes up a considerable quantity; and this solution mixes either with water or spirit, without growing turbid. As a pigment, it makes a beautiful yellow, which is much used by the painters. Dr Lewis says, that it makes a beautiful and durable citron yellow stain upon marble, whether rubbed in substance on the hot stone, or applied in form of a spiritous tincture. When it is rubbed on cold marble, the stone must afterwards be heated, to make the colour

As a medicine, gamboge evacuates both ways; some condemn it as acting with great violence, and occasioning dangerous cathartes. Geoffroy seems fond of it, and says, that he has frequently given from 4 to 8 grains, without its proving at all emetic; and that its operation is soon over, if given in a liquid form, and sufficient. It stands not in need of any corrector. In form of a bolus or pill, it is most apt to be retentive, but very rarely has this effect if *mercurius dulcis*. He nevertheless cautions its use where the patient cannot easily bear it. It has been used in dropsy with tartar or jalap, or both, to quicken the action. It is also recommended by some in cases of the tape worm, if given in a liquid form, and if the expelled in 2 or 3 hours, it is repeated 3d time with safety and efficacy. It has been given to this extent to children. This is said to be the report by Baron Van Swieten, which was by Dr Hucensward, and with his success in the removal of the tape worm.

* **GAMBOL**. *n. f.* [from the verb. *gambol*.] A hop; a leap for joy.—A gentleman's favourite spaniel, that would be still toying upon him, and playing a thousand tricks. *L'Esfrange*.

Bacchus through the conquer'd And beats in gambols his'd before him.

2. A frolic; a wild prank.—

For who did ever play his gambol With such unsuffering gambols?

* To **GAMBOL**. *v. n.* *gambol* dance; to skip; to frolic; to jump for merry frolics.—

Bears, tigers, ounces, par Gambol'd before them. *Antic*
The king of elfs, and little fair Gambol'd on heaths, and danc'd o

The monsters of the flood Gambol around him in the wat'ry And heavy whales in awkward me

2. To leap; to start.—

'Tis not madness That I have utter'd; bring me to And I the matter will record, w Would gambol from.

GAMBON, a river of France, w the Seine, near Andely.

* **GAMBREL**. *n. f.* [from *gambrel* Ital.] The leg of a horse.—What admirable, than for the principles of tendon to be so mixed as to make and yet to have the strength of iron by the weight which it endures, lyi gambrel, doth then the tendon, wh with a man upon his back. *Grege*.

GAMERON, **GOMERON**, or **BE** a city of Peina. See **GOMERON**.

VISSA, a town of Maritime Austria, miles E. of Cabo of Istria.

ME, in law, (§ 1. def. 8.) signifies birds, or

n or killed by fowling or hunting. The

f such animals *feræ naturæ* as are known

denomination of game, with the right of

taking, and destroying them, is vested

alone, and from him derived to such of

his subjects as have received the grants of a chace, a

park, or free warren. By the law of nature, indeed,

every man, from the prince to the peasant, has an

equal right of pursuing, and taking to his own use,

all such creatures as are *feræ naturæ*, and there-

fore the property of nobody, but liable to be seized

by the first occupant. But it follows, (says Black-

stone,) from the very end and constitution of so-

ciety, that this natural right, as well as many others

belonging to man as an individual, may be restrain-

ed by positive laws enacted for reasons of state, or

for the supposed benefit of the community. This

restriction may be either with respect to the place

in which this right may, or may not, be exercised;

with respect to the animals that are the subjects

of this right; or with respect to the persons allowed

or forbidden to exercise it. And, in consequence

of this authority, we find, that the municipal

laws of many nations have exerted such power of

restraint; have in general forbidden the entering

on another man's grounds, for any cause, without

the owner's leave; have extended their protection

to such particular animals as are usually the ob-

jects of pursuit; and have invested the preroga-

tive of hunting and taking such animals in the so-

vereign of the state only, and such as he shall au-

thorize. Many reasons have concurred for making

these constitutions: as, 1. For the encouragement

of agriculture and improvement of lands, by gi-

ving every man an exclusive dominion over his

own soil. 2. For the preservation of the several

species of these animals, which would soon be

extirpated by a general liberty. 3. For prevention

of idleness and dissipation in husbandmen, artificers,

and others of lower rank; which would be the

unavoidable consequence of universal licence. 4.

For prevention of popular insurrections and re-

sistance to the government, by disarming the bulk

of the people: which last is a reason oftener meant

than avowed, by the makers of forest or game

laws. Nor, certainly, in these prohibitions is

there any natural injustice, as some have weakly

enough supposed: since, as Puffendorf observes,

the law does not hereby take from any man his

present property, or what was already his own;

but barely abridges him of one means of acquiring

a future property, that of occupancy; which in-

deed the law of nature would allow him, but of

which the laws of society have in most instances

very justly and reasonably deprived him. Yet, how-

ever defensible these provisions in general may be,

on the footing of reason, or justice, or civil policy,

we must, notwithstanding, acknowledge, that, in

their present shape, they owe their immediate ori-

ginal to slavery. It is not till after the irruption

of the northern nations into the Roman empire,

that we read of any other prohibitions, than that

natural one of not sporting on any private grounds

without the owner's leave. With regard to the

rise and original of our present civil prohibitions,

it will be found, that all forest and game laws were

introduced into Europe at the same time, and by

the same policy, that gave birth to the feudal

system; when those swarms of barbarians issued

from their northern hive, and laid the foundation

of most of the present kingdoms of Europe on the

ruins of the western empire. For when a con-

quering general came to settle the economy of a

conquished country, and to part it out among his soldiers or feudatories, who were to render him military service for such donations; it behoved him, in order to secure his new acquisitions, to keep the *rustici* or natives of the country, and all who were not his military tenants, in as low a condition as possible, and especially to prohibit them the use of arms. Nothing could do this more effectually than a prohibition of hunting and sporting: and therefore it was the policy of the conqueror to reserve this right to himself, and such on whom he should bestow it; which were only his capital feudatories or greater barons. And, accordingly, we find, in the feudal constitutions, one and the same law prohibiting the *rustici* in general from carrying arms, and also proscribing the use of nets, snares, or other engines for destroying the game. This exclusive privilege well suited the martial genius of the troops, who delighted in a sport, which in its pursuit and slaughter bore some resemblance to war. *Vita omnis* (says Cæsar, speaking of the ancient Germans) *in venationibus atque in studiis rei militaris consistit*. And Tacitus in like manner observes, that *quoties bella non ineunt, multum venatibus, plus per otium transigunt*. And indeed, like some of their modern successors, they had no other amusement to entertain their vacant hours; they despising all arts as effeminate, and having no other learning than was couched in such rude ditties as were sung at the solemn carousals, which succeeded these ancient huntings. And it is remarkable, that in those nations where the feudal policy remains the most unaltered, the forest or game laws continue in their highest rigour. In France, before the revolution, all game was properly the king's; and in some parts of Germany it is death for a peasant to be found hunting in the woods of the nobility. With us in Britain, also, hunting has ever been esteemed a most princely diversion and exercise. The whole island was replenished with all sorts of game in the times of the Britons; who lived in a wild and pastoral manner, without inclosing or improving their grounds; and derived much of their subsistence from the chase, which they all enjoyed in common. But when husbandry took place under the Saxon government, and lands began to be cultivated, improved, and inclosed, the beasts naturally fled into the woody and desert tracts, which were called the *forests*; and, having never been disposed of in the first distribution of lands, were therefore held to belong to the crown. These were filled with great plenty of game, which our royal sportsmen reserved for their own diversion, on pain of pecuniary forfeiture for such as interfered with their sovereign. But every freeholder had the full liberty of sporting upon his own territories, provided he abstained from the king's forests. However, upon the Norman conquest, a new doctrine took place; and the right of pursuing and taking all beasts of chase or *venary*, and such other animals as were accounted *game*, was then held to belong to the king, or to such only as were authorised under him. And this, as well upon the principles of the feudal law, that the king is the ultimate proprietor of all the lands in the kingdom, they being all held of him as the chief lord, or lord *paramount of the fee*; and that therefore he has

the right of the universal soil, to enter the land and to chase and take such creatures at his pleasure: as also upon another maxim of the common law, that these animals are *bona vacantia* having no other owner, belong to the king as a prerogative. As therefore the former realm was held to vest in the king a right to pursue and take them any where, the latter was supposed to vest in the king, and such as he should authorise, an *exclusive* right. This right, thus vested in the crown, was exerted with the utmost rigour, and after the time of the Norman establishment, not only in the ancient forests, but in the new ones which the Conqueror made, by laying out vast tracts of country, depopulated for the purpose, and reserved solely for the king's diversion; in which were exercised the most tyrannies and oppressions, under colour of forest laws for the sake of preserving the beasts of chase, to kill any of which, within the limits of the forest, was as penal as the death of a man. And in consequence of the same principle, king John issued a general interdict upon the winged as well as the footed creation: *capturam avium per totam regiam interdixit*. The cruel and oppressive hardships, which these forest laws created to the subject, occasioned our ancestors to be anxious for their reformation, as for the relaxation of the feudal rigours and the other exactions imposed by the Norman family; and accordingly the immunities of *charta de foresta* as was intended for, and extorted from the king, with much difficulty, as those of *magna charta*. By this charter, confirmed in parliament (1215. III.) many forests were disafforested, or of their oppressive privileges, and regulations made in the regimen of such as remained. Particularly killing the king's deer was made a capital offence, but only punished by imprisonment, or abjuration of the realm, by a variety of subsequent statutes, together with the long acquiescence of the crown without enforcing the forest laws, this prerogative is now no longer a grievance to the subject. But the king reserved to himself the *forest* for his own diversion, so he granted out from time to time other tracts of land to his subjects under the name of *chases* or *parks*; or gave them licence to hunt such in their own grounds; which included smaller forests in the hands of a subject, but governed by the forest laws; and by the common law no person is at liberty to take or kill any of the beasts of chase, but such as hath an ancient chase or warren, unless they be also beasts of prey. As to a prior species of game, called *beasts and fowls of warren*; the liberty of taking or killing them is another franchise, or royalty, derived likewise from the crown, and called *free warren*; a word which signifies preservation or custody: as the liberty of taking and killing fish in a stream or river is called a *free fishery*; of which however, no new franchise can at present be created by the express provision of *magna charta* 16. The principal intention of granting these franchises, or liberties, was in order to protect the game, by giving him a sole and exclusive power of killing it himself, provided he preserved it for other persons. And no man but he who

the warren, by grant from the crown, which supposes one, can justify sporting upon another man's soil; nor thorough strictness of common law, either sporting at all. However new this may seem, it is a regular consequence as has been before delivered, that the sole hunting and destroying game belongs to the king. This appears, as well from the deduction here made, as because he has his subjects an exclusive right of taking which he could not do, unless such a right inherent in himself. And hence it follows that no person whatever, but he who derives his right from the crown, is by law intitled to take or kill any beast of his game whatsoever. It is true, that, in consequence of the crown, the frequent enclosure of warren in ancient times, and the introduction of new penalties of late by certain statutes preserving the game, this exclusive right of the king is little known or considered; so that many are exempted from these motions looking upon himself as at liberty to do as he pleases with the game: whereas it is strictly true, and that no man, unless qualified he may vulgarly be esteemed, can encroach on the royal prerogative of game, unless he can show a particular grant of free warren; or a prescription in times of a grant; or some authority under parliament. As to the latter, there are instances wherein an express permission was ever given by statute; the one in 1271. altered by 9 Jac. I. c. 11. and repealed by 22 and 23 Car. II. c. 25. which gave authority, so long as they remained in the hands of the owners of free warren, to lords of manors to appoint game-keepers, for the use of such lord or lady; since that time some alteration still subsists, and plainly shews a power not to have been in them before. The truth of the matter is, that these game laws qualify nobody, except in the instance of a gamekeeper, to kill game: but only to enable a regular and formal process of an action against an injured person, who perhaps too might receive, these statutes inflict additional penalties covered either in a regular or summary way of the king's subjects, from certain inferior rank who may be found offending against the law. But it does not follow that persons exempted from these additional penalties are authorized to kill game. The circumstance of 1000 l. per ann. and the rest, are not prohibitions but exemptions. And these persons exempted from the penalties of the game are not only liable to actions of trespass by the owner of the land; but also, if they kill game within the limits of any royal franchise, they are liable to actions of such who may have the sole or free warren therein. Upon the

whole, it appears, that the king, by his prerogative, and such persons as have, under his authority, the ROYAL FRANCHISE of CHASE, PARK, or FREE WARREN, (See these articles,) are the only persons who may acquire any property, however fugitive and transitory, in these animals *feræ naturæ*, while living; which is said to be vested in them *propter privilegium*. And such persons as may thus lawfully hunt, fish, or fowl, *ratione privilegii*, have only a qualified property in these animals: it not being absolute or permanent, but lasting only so long as the creatures remain within the limits of such respective franchise or liberty, and ceasing the instant they voluntarily pass out of it. It is held indeed, that if a man starts any game within his own grounds, and follows it into another's, and kills it there, the property remains in himself. And this is grounded on reason and natural justice; for the property consists in the possession; which possession commences by the finding it in his own liberty; and is continued by the immediate pursuit. And so, if a stranger starts game in one man's chase or free warren, and hunts it into another liberty, the property continues in the owner of the chase or warren; this property arising from privilege; and not being changed by the act of a mere stranger. Or if a man starts game on another's private grounds, and kills it there, the property belongs to him on whose grounds it was killed, because it was also started there; this property arising *ratione soli*. Whereas if, after being started there, it is killed in the grounds of a third person, the property belongs not to the owner of the first ground, because the property is local; nor yet to the owner of the second, because it was not started in his soil; but it vests in the person who started and killed it, though guilty of a trespass against both the owners. See LAWS, RESPECTING GAME.

(3.) GAMES, in antiquity, (§ 1. *def.* 9.) were public diversions, exhibited on solemn occasions. Such among the Greeks were the Olympic, Pythian, Isthmian, Nemean, &c. games; and, among the Romans, the Apollinarian, Circensian, Capitoline, &c. games. See APOLLINARIAN, FUNERAL, § 3, OLYMPIC, PYTHIAN, &c.

(4.) GAMES, MODERN, are usually distinguished into those of exercise and address, and those of hazard. To the first belong chess, tennis, billiards, &c. and to the latter those performed with cards, or dice, as back-gammon, ombre, picquet, whist, &c. See BACK-GAMMON, CARDS, DICE, GAMING, &c.

* To GAME. *v. n.* [*gaman*, Saxon.] 1. To play at any sport. 2. To play wantonly and extravagantly for money. *Gaming* leaves no satisfaction behind it: it no way profits either body or mind. *Locke*.

(1.) * GAMECOCK. *n. s.* [*game* and *cock*.] Cocks bred to fight. They manage the dispute as fiercely as two gamecocks in the pit. *Locke*.

(2.) GAME-CKOCK. See COCK-FIGHTING.

* GAME-EGG. *n. s.* [*game* and *egg*.] Eggs from which fighting cocks are bred.—

Thus boys hatch game-eggs under birds of prey,

To make the fowl more furious for the fray.

(Garth.)

(1.) GAME.

n. f. [game and keep.] A
or game, and sees it is not

You're a merry *gamester*

My lord Sands.

GAMELIA, in Grecian antiquity, a nuptial
sacrifice, held in the ancient Greek
before a marriage; so called,

had of shewing themselves un-
esent to their had to some
ad particular obligation.

GAMELION, the ancient chronology, was
the 8th month of the Athenian year, containing 29
days, and answering to the end of January and
beginning of February. It was thus called, as be-
ing, in the opinion of the Athenians, the most
proper season of the year for marriage.

GAMELORA, an island in the Mediterranean,
near the NE. coast of Tunis, 3 miles E. of Cape
Zibeeb.

GAMESOME. *adj.* [from game.] Frolic-
some; gay; sportive; playful; sportful.—Geron,
though old, yet *gamesome* kept one end with Cos-
mas. *Sidney*.

I am not *gamesome*; I do lack some part
Of that quick spirit that is in Antony.

Shakeſp. Jul. Cesar.

The *gamesome* wind among her tresses plays,
And curl'eth up those growing riches short.

Pauſan.

Behal, in like *gamesome* mood.

Milton.

—This *gamesome* humour of children should rather
be encouraged, to keep up their spirits and
improve their strength and health, than curbed or
restrained. *Locke*.

GAMESOMELY. *adv.* [from *gamesome*.]
Merrily.

GAMESOMENESS. *n. f.* [from *gamesome*.]
Sportiveness; merriment.

GAMESTER. *n. f.* [from game.] 1. One
who is vitiously addicted to play.—Keep a *game-
ster* from the dice, and a good student from his
book, and it is wonderful. *Shakeſp.*—A *gamester*,
the greater master he is in his art, the worse man
he is. *Bacon*.—

Gamesters for whole patrimonies play;

The steward brings the deeds, which must con-
vey

The whole estate.

Dryd. Juv.

—Could we look into the mind of a common
gamester, we should see it full of nothing but
trumps and mattadores: her slumbers are haunt-
ed with kings, queens, and knaves. *Addis.*—

All the superfluous whims relate,

That fill a female *gamester's* pate,

What agony of soul she feels

To see a knave's inverted heels.

Swift.

—Her youngest daughter is run away with a *game-
ster*, a man of great beauty, who in dressing and
dancing has no superior. *Law*. 2. One who is
engaged at play.—

When lenity and cruelty play for kingdoms,

The gentler *gamester* is the soonest winner. *Shak.*

—A man may think, if he will, that too eyes see
no more than one; or that a *gamester* seeth always
more than a looker on: but, when all is done,
the help of good counsel is that which setteth bu-
siness straight. *Bacon*. 3. A merry frolicsome per-
son.—

GAMET, an island of Denmark, 3
the continent, and 2 WSW. of Ripen

(1.) **GAMING**, the art of playing
any game, particularly those of hazard
dice, tables, &c. Gaming has at all

GAMING, CHANCE IN. Hazard, or chance, of mathematical consideration, because of more and less. Gamesters either set an equality of chance, or are supposed

This equality may be altered in the the game, by the greater good fortune of one of the gamesters, whereby he have a better chance, so that his share in is proportionably better than at first.

and less runs through all the ratios be- ality and infinite difference, or from an ittle difference till it come to an infinite- ne, whereby the game is determined.

a game, therefore, with regard to the is a chance of the proportion the two r to each other. The probability of an eater or less, according to the number of

r which it may happen, compared with ices by which it may either happen or fail.

ivre, in a treatise *de Mensura Sortis*, has the variety of chances in several cases in gaming, the laws of which may be

l by what follows. Suppose p the num- s in which an event may happen, and ber of cases wherein it may not happen,

have the degree of probability, which is her as p to q . If two gamesters, A and on this footing, that, if the cases p hap- all win; but if q happen, B shall win,

ke be a ; the chance of A will be $\frac{p a}{p+q}$, f B $\frac{q a}{p+q}$; consequently, if they sell the

es, they should have that for them re-

If A and B play with a single die, on ion. that, if A throw two or more aces

rows, he shall win; otherwise B shall it is the ratio of their chances? Since

one case wherein an ace may turn up, herein it may not, let $a=1$, and $b=5$.

since there are eight throws of the die,

nd you will have $a+b|n-b^n-nab^n-1$, $n-1$: that is, the chance of A will be

B as 663991 to 10156525, or nearly as

and B are engaged at single quoits; playing some time, A wants 4 of being

6; but B is so much the better game- is chance against A upon a single throw

as 3 to 2; What is the ratio of their Since A wants 4, and B 6, the game

ed at nine throws; therefore, raise $a+b$ h power, and it will be $a^9+9 a^8b+36$

$b^3+126 a^5b^4+126 a^4b^5$, to $84 a^3b^6+36$

b^3+6^9 : call a 3, and b 2, and you will tio of chances in numbers, viz. 1759077

A and B play at single quoits, and A gamester, so that he can give B 2 in 3:

ratio of their chances at a single throw? e chances as x to 1, and raise $x+1$ to

hich will be $x^3+3 x^2+3 x+1$. Now ld give B 2 out of 3, A might under- three throws running; and consequent-

PART I.

ly the chances in this case will be as x^3 to $3x^2+3 x+1$. Hence $x^3=3 x^2+3 x+1$; or $2x^3=3x^2+3x-3x+1$. And therefore $x\sqrt[3]{2}=x+1$; and, con- sequently, $x=\frac{1}{\sqrt[3]{2}-1}$. The chances, therefore, are

$\frac{1}{\sqrt[3]{2}-1}$, and 1, respectively. Again, suppose I

have two wagers depending, in the first of which I have 3 to 2 the best of the lay, and in the second,

7 to 4; What is the probability I win both wagers? I. The probability of winning the first is $\frac{3}{5}$, that

is the number of chances I have to win, divided by the number of all the chances: the probability

of winning the second is $\frac{7}{11}$; therefore, multiply- ing these two fractions together, the product will

be $\frac{21}{55}$, which is the probability of winning both wagers. Now, this fraction being subtracted from

1, the remainder is $\frac{34}{55}$, which is the probability I do not win both wagers: therefore the odds against

me are 34 to 21. II. If I would know what the probability is of winning the first, and losing the

second, I argue thus; the probability of winning the first is $\frac{3}{5}$, the probability of losing the second

is $\frac{4}{11}$: therefore multiplying $\frac{3}{5}$ by $\frac{4}{11}$, the pro- duct $\frac{12}{55}$ will be the probability of my winning the

first, and losing the second; which being subtrac- ted from 1, there will remain $\frac{43}{55}$, which is the

probability I do not win the first, and at the same time lose the second. III. If I would know what

the probability is of winning the second, and at the same time losing the first, I say thus: The

probability of winning the second is $\frac{7}{11}$: the pro- bability of losing the first is $\frac{2}{5}$: therefore, multi- plying these two fractions together, the product

$\frac{14}{55}$ is the probability I win the second, and also lose the first. IV. If I would know what the pro-

bability is of losing both wagers, I say, the pro- bability of losing the first is $\frac{2}{5}$, and the probability

of losing the second $\frac{4}{11}$: therefore the probability of losing them both is $\frac{8}{55}$: which, being subtrac- ted from 1, there remains $\frac{47}{55}$: therefore, the odds

of losing both wagers is 47 to 8. This reasoning is applicable to the happening or failing of any e-

vents that may fall under consideration. Thus if I would know what the probability is of missing

an ace four times together with a die, this I con- sider as the failing of four different events. Now

the probability of missing the first is $\frac{5}{6}$, the second is also $\frac{5}{6}$, the third $\frac{5}{6}$, and the fourth $\frac{5}{6}$; therefore

the probability of missing it four times together is $\frac{5}{6} \times \frac{5}{6} \times \frac{5}{6} \times \frac{5}{6} = \frac{625}{1296}$; which being subtracted

from 1, there will remain $\frac{671}{1296}$ for the probabili- ty of throwing it once or oftener in four times;

therefore the odds of throwing an ace in four times, is 671 to 625. But if the flinging of an ace was

undertaken in three times, the probability of mis- sing it three times would be $\frac{5}{6} \times \frac{5}{6} \times \frac{5}{6} = \frac{125}{216}$; which

being subtracted from 1, there will remain $\frac{91}{216}$ for the probability of throwing it once or oftener in

three times: therefore the odds against throwing it in three times are 125 to 91. Again, suppose

we would know the probability of throwing an ace once in four times, and no more: since the

probability of throwing it the first time is $\frac{1}{6}$, and of missing it the other three times, is $\frac{5}{6} \times \frac{5}{6} \times \frac{5}{6}$, it

follows, that the probability of throwing it the first time, and missing it the other three successive

Since, is $\frac{1}{2} \times \frac{1}{2} \times \frac{1}{2} \times \frac{1}{2} = \frac{1}{16}$; because it is possible to hit every throw as well as the first, it follows, that the probability of throwing it once in four throws, and missing the other three, is $\frac{1}{16} \times \frac{15}{16} = \frac{15}{256}$; which being subtracted from 1, there will remain $\frac{241}{256}$ for the probability of throwing it once, and no more, in four times. Therefore, if one undertake to throw an ace once, and no more, in four times, he has 100 to 796 the work of the day, or 5 to 8 very near. Suppose two events are such, that one of them has twice as many chances to come up as the other; what is the probability that the event, which has the greater number of chances to come up, does not happen twice before the other happens once, which is the case of flinging 7 with two dice before 4 once? Since the number of chances is as 2 to 1, the probability of the first happening before the second is $\frac{2}{3}$, but the probability of its happening twice before it is but $\frac{2}{3} \times \frac{2}{3}$ or $\frac{4}{9}$: therefore it is 5 to 4, seven does not come up twice before four once. But, if it were demanded, what must be the proportion of the facilities of the coming up of two events, to make that which has the most chances come up twice, before the other comes up once? The answer is, 22 to 5 very nearly: whence it follows, that the probability of throwing the first before the second is $\frac{22}{27}$, and the probability of throwing it twice is $\frac{44}{27} \times \frac{44}{27}$, or $\frac{1936}{729}$: therefore the probability of not doing it is $\frac{533}{729}$: therefore the odds against it are as 145 to 144, which comes very near an equality. Suppose there is a heap of 12 red cards, and another heap of 12 black cards. What is the probability, that, taking one card at a venture out of each heap, I shall take out the two aces? The probability of taking the ace out of the first heap is $\frac{1}{12}$, the probability of taking the ace out of the second heap is $\frac{1}{12}$: therefore the probability of taking out both aces is $\frac{1}{12} \times \frac{1}{12} = \frac{1}{144}$, which being subtracted from 1, there will remain $\frac{143}{144}$: therefore the odds against me are 143 to 1. In cases where the events depend on one another, the manner of arguing is somewhat altered. Thus, suppose that out of one single heap of 12 cards of one colour I should undertake to take out first the ace; and, secondly, the two: though the probability of taking out the ace be $\frac{1}{12}$, and the probability of taking out the two be likewise $\frac{1}{12}$: yet, the ace being supposed as taken out already, there will remain only 11 cards in the heap, which will make the probability of taking out the two to be $\frac{1}{11}$: therefore the probability of taking out the ace, and then the two, will be $\frac{1}{12} \times \frac{1}{11}$. In this last question the two events have a dependence on each other; which consists in this, that one of the events being supposed as having happened, the probability of the other's happening is thereby altered. But the case is not so in the two heaps of cards. If the events in question be n in number, and be such as have the same number a of chances by which they may happen, and likewise the same number b of chances by which they may fail, raise $a+b$ to the power n . And if A and B play together, on condition that if either one or more of the events in question happen, A shall win, and B lose, the probability of A's winning will be

$$\frac{a^n + b^n - 1}{a + b}; \text{ and that of B's winning will be } \frac{b^n}{a + b};$$

for when $a+b$ is actually raised to the only term in which a does not occur is b^n : therefore all the terms but the last are to A. Thus if $n=3$, raising $a+b$ to the power 3, all the terms but the last are to A; and therefore the probability of A's winning will be

$$\frac{a^3 + 3a^2b + 3ab^2 + b^3}{a + b}, \text{ or } \frac{a^3 + 3a^2b + 3ab^2}{a + b},$$

and the probability of B's winning is

$$\frac{b^3}{a + b} \text{ for the only term in which } a \text{ does not occur are the } a^2b \text{ and } ab^2.$$

(3.) GAMING, LAWS AGAINST. Car. II. c. 7. if any person by playing shall lose more than 100l. at play, shall not be compellable to pay the value, the king, the other to the informer. 9 Ann. c. 14. enacts, that all bonds, covenants, given for money won at play, sent at the time to play withal, shall be void: that all mortgages and incumbrances made upon the same consideration, shall be void to the heir of the mortgager: person at one time loses 10l. at play, the winner, and recover it back by 10l. at law; and, in case the loser does not pay, the person may sue the winner for treble cost; and the plaintiff in either case the defendant himself upon oath: and of these suits no privilege of parliamen allowed. The statute farther enacts person cheats at play, and at one time than 10l. or any valuable thing, he is to be indicted thereupon, and shall forfeit five l. shall be deemed infamous, and corporal punishment as in case of wilful perjury. By several statutes of the reign of king all private lotteries by tickets, cards, particularly the games of faro, basset, a hazard, passage, roly-polly, and all with dice, except backgammon), are under a penalty of 200l. for him that keeps such lotteries, and 50l. a-time for Public lotteries, unless by authority of parliament and all manner of ingenious device for the promotion of sales or otherwise, the end are equivalent to lotteries, prohibited by a great variety of statutes, and heavy pecuniary penalties. But particular provisions will be ever lame and deficient games of mere chance are at once prevented by the invention of sharpers being swifter than the punishment of the law, which only humours one device to another. The statute 1. Geo. IV. to prevent the multiplicity of gaming, directs that all matches under 50l. value shall be null and void, to be paid by the winner

ing, and pool, by such as advertise the
y statute 12 Geo. II. c. 34. the statute 9
urther enforced, and some deficiencies
the forfeitures of that act may now be
in a court of equity; and, moreover,
n be convicted, upon information or in-
of winning or losing at any sitting 10 l.
ithin 24 hours, he shall forfeit five times

Thus careful has the legislature been
t this destructive vice: which may show
aws against gaming are not so deficient,
es and our magistrates in putting those
ecution.

s of a rope taken round the bowsprit,
d through holes in knees of the head,
enter security of the bowsprit.

IUT. See GAMUT.

B, a town of the Helvetic republic, part-
anton of Schweitz, and partly in that
5 miles S. of Appenzel.

IE, a parish of Scotland, on the coast
ire, 9½ miles long, and 3½ broad. The
y barren, but in many places very fertile,
is almost one continued chain of stupen-
s, 200 yards high, and abounds with
haddocks, turbot, &c. The salmon
the Dovern is let by the E. of Fife, for
year. The church was built in 1004,
likely to last for many ages more. The
i in 1790, stated by the rev. Mr Wilson,
rt to Sir J. Sinclair was 3000, and was
bled since 1732. Longevity is common.
ter, Mr Wilson, was in his 97th year,
ransmitted his Statistical Account; se-
r persons were then living above 90;
rman died a few years before aged 109.
i has been much improved by the exer-
ie earl of Fife, the late Mr Garden of
id Lord Gardenston.

IAMUT. *n. f.* [*gama*, Ital.] The scale
notes.—

Madam, before you touch the instrument,
To learn the order of my fingering,
I must begin with rudiments of art,
To teach you *gamut* in a briefer sort. *Shak.*

When by the *gamut* some musicians make
A perfect long, others will undertake,
By the same *gamut* chang'd to equal it:
Things simply good can never be unfit. *Donne.*

Long has a race of heroes fill'd the stage,
That rant by rote, and through the *gamut* rage;
In songs and airs express their martial fire,
Combat in trills, and in a fugue expire. *Addis.*

(2) GAMUT, GAMMUT, or GAM-ut. See
MUSIC. The invention of this scale is owing to
Guido Aretin, monk of Arezzo, in Tuscany, a-
bout A. D. 1009; though it is not so properly an
invention, as an improvement on the diagram or
scale of the ancients. See ARETIN, N° 2. Several
alterations have been made in the *gamut*; M. le
Maire, particularly, has added a 9th note; viz. *fi*;
and the English usually throw out both *ut* and *fi*,
and make the other five serve for all.

(1.) GAN, a city of China, of the first rank;
capital of the province of Se-tchuen. Lon. 13. 8.
W. of Peking. Lat. 31. 16. N.

(2.) GAN, a town of France, in the department
of the Lower Pyrenees, 4½ miles S. of Pau, and
10 E. of Oleron.

(3.) * GAN, for *began*, from *'gin* for *begin*.—

The noble knight *'gan* feel

His vital force to faint.

of Allier, on the Loire; 15 miles NE. of Moulins.

* To GANCH. *v. a.* [*ganciare*, from *gancio*, a
hook, Italian; *ganche*, French.] To drop from
a high place upon hooks by way of punishment;
a practice in Turkey, to which *Smith* alludes in
his *Pocockius*.—

Cohors catenis qua pia stridulis

Gemunt onusti, vel sude trans lnum

Luctantur acta, pendulive

Sanguineis trepidant in uncis. *Musa Angl.*

GANDANOOKS, or EGYPTIAN HERRINGS,
in ichthyology, a species of fish, belonging either
to the genus of CLUPEA or SCOMBER, of which
vast shoals are caught in the Forth, about the
end of Sept. J. P. Erskine, Esq. of Marr, thus
describes them in his Statistical Account of Alloa.
“ They have a faint resemblance of the mackerel,
but with a long sharp bill like a snipe. This be-
comes fatal to them on our muddy banks, as the
bill is fixed in the mud; and in this way they are
entangled, and caught in great quantities, on the
ebbing of the tide. They are not unpleasant, but
rather dry. They are, however, a great relief to
many poor people. *Stat. Acc.* Vol. VIII. p. 598.

GANDE, a river of Germany, which runs in-
to the Leine, 4 miles WSW. of Gandersheim.

GANDELU, a town of France, in the depart-
ment of Aisne, 8 miles WNW. of Chateau Thier-
ry, and 9 N. of Ferte.

(1.) * GANDER. *n. f.* [*gandra*, Saxon.] The
male

make
as the

GANFORD, a town in Durham, near Burnard.

* GANG. *n. f.* [from the verb.] A number
herding together; a troop; a company; a tribe;
a herd. It is seldom used but in contempt or ab-
horrence.—Oh, you panderly rascals! there's a
knot, a gang, a pack, a conspiracy against me.
Shak: Merry Wives.—As a gang of thieves were
robbing a house, a mastiff fell a barking. *L'Estr.*

Admitted in among the gang,
He ad, and talks as they befriend him. *Prior.*

* To GANG. *v. n.* [*gangen*, Dut. *gangan*, Sax.
gang, Scottish.] To go; to walk; an old word
not now used, except ludicrously.—

But let them gang alone,
As they have brew'd, so let them bear blame.

—Your flaunting beaux gang with their breasts o-
pen. *Arbutnot.*

GANGANELLI. See CLEMENT XIV.

GANGEA. See GANDJA.

GANGLT, a town of Germany, in the cir-
cle of Westphalia, and ci-devant duchy of Juli-
ers; now annexed to the French republic, and
included in the dept. of the Roer: 12 miles SSE.
of Ruremond.

(1.) GANGES, a large and celebrated river of
India. It rises in the mountains which border on
the Thibet, in 96° lon. E. and 35° 45' lat. N. It
crosses several kingdoms, running from N. to S.
and falls into the bay of Bengal by several mouths.
The waters are lowest in April and May, and
highest before the end of September. It over-

flows yearly like the Nile; and renders it
fruitful as the Delta in Egypt. The
these parts hold the water of this river in
neration; and it is visited annually by a
ous number of pilgrims from all parts.
The British have several settlements on it.
The greatest happiness that many of the
wish for, is to die in this river. See I
FOOTER.

(2.) GANGES, a town of France, in
of Herault, 20 miles NE. of Lodeve, a
of Montpellier.

(3, 4.) GANGES ISLANDS, two small i-
tween Borneo and the Gulf of Siam.
45. E. Lat. 4. 45. N.

ANTELOPE. GANTLET. n. f. [gant-
corrupted from *gantelope*, *gant*, all,
to run, Dutch.] A military punish-
rich the criminal running between the
es a lash from each man.—

ould'st thou, friend, who hast two legs

thou to run the gantlet these expose,
le company of hob-nail'd shoes? *Juv.*
ntlemen are driven with a whip, to
tlet through the several classes. *Locke.*

TELOPE; IN SHIPS OF WAR, is exe-
following manner: The whole ship's
posed in two rows, standing face to
sides of the deck, so as to form a lane
go forward on one side, and return
other; each person being furnished
twisted cord, called a *knittle*, having
ts upon it. The delinquent is then

stripped naked above the waist, and ordered to
pass forward between the two rows of men, and
aft on the other side, a certain number of times,
rarely exceeding three, during which every per-
son gives him a stripe as he runs along. In his
passage through this painful ordeal, he is some-
times tripped up, and very severely handled while
incapable of proceeding. This punishment, which
is called *running the gauntlet*, is seldom inflicted,
except for such crimes as will naturally excite a
general antipathy among the seamen; as, on some
occasions, the culprit would pass without recei-
ving a single blow.

(3.) **GANTELOPE, IN THE LAND SERVICE.**
When a soldier is sentenced to run the gantelope,
the regiment is drawn out in two ranks facing
each other; each soldier, having a switch in his
hand, lashes the criminal as he runs along naked
from the waist upwards. While he runs, the
drums beat at each end of the ranks. Sometimes
he runs 3, 5, or 7, times, according to the nature
of the offence. The major is on horseback, and
takes care that each soldier does his duty.

GANTLET. See GANTELOPE and GAUNT-
LET.

GANTON, a town near Scarborough, Yorksh.

GAN-YE, a town of China, of the 3d rank, in
the prov. of Se-Tchuen, 52 miles W. of Hoa.

GANYMEDES, in mythology, a beautiful
youth of Phrygia, son of Tros and brother to Ilus,
kings of Troy; or, according to Lucian, the son
of Dardanus. Jupiter was charmed with him;
and carrying him away, made him his cup-bearer
in the room of Hebe. Some say that he caused
him to be carried away by an eagle, and others
affirm he was himself the ravisher under the form
of that bird. He deified this youth; and to com-
fort his father made a present to him of some of
those swift horses that the gods rode upon.

* **GANZA. n. f.** [*ganfa*, Spanish, a goose.] A
kind of wild goose, by a flock of which a virtuoso
was fabled to be carried to the lunar world.—

They are but idle dreams and fancies,
And favour strongly of the *ganza's*. *Hudib.*

(1.) **GAOGA**, a country of Africa, W. of Nubia.

(2.) **GAOGA**, a town in the above territory, feat-
ed on a large lake. Lon. 26. 0. E. Lat. 16. 0. N.

(1.) * **GAOL. n. f.** [*geol*, Welsh; *geole*, Fr.]
A prison; a place of confinement. It is always
pronounced and too often written *jail*, and some-
times *goal*.—

Then am I the prisoner, and his bed my gaol. *Sh.*

Have I been ever free, and must my house

Be my retentive enemy, my gaol? *Sh. Timon.*

—If we mean to thrive and do good, break open
the gaols, and let out the prisoners. *Shak. H. VI.*

(2.) **GAOL.** Every county has two gaols, one
for debtors, which may be any house where the
sheriff pleases; the other for the peace and mat-
ters of the crown, which is the county gaol. If
a gaol be out of repair, or insufficient, &c. jus-
tices of peace, in their quarter-sessions, may con-
tract with workmen for the rebuilding or repair-
it; and by their warrant order the sum agreed on
for that purpose to be levied on the several hun-
dreds, and other divisions in the county by a just
rate, 11 & 12 Will. III. c. 19. See PRISON.

* **To GAOL. v. a.** [from the noun.] To im-
prison;

prison; to commit to gaol.—*Gaol*ing vagabonds, was chargeable, pestiferous, and of no open example. *Bacon*.

(1.) * **GAOL DELIVERY.** *n. f.* [*gaol* and *deliver*.] The judicial process, which, by condemnation or acquittal of persons confined, evacuates the prison.

Then doth th' aspiring soul the body leave,
Which we call death; but were it known to all,
What life our souls do by this death receive,
Men would it birth or *gaol-delivery* call. *Davies*.

—These make a general *gaol-delivery* of souls, not for punishment. *Saunders*.

(2.) **GAOL DELIVERY.** The administration of justice being originally in the crown, in former times our kings in person rode through the realm once in 7 years, to judge of and determine crimes and offences; afterwards justices in eyre were appointed; and since, justices of assize and gaol-delivery, &c. A commission of gaol-delivery is a patent, in nature of a letter from the king to certain persons, appointing them his justices, or two or three of them, and authorising them to deliver his gaol, at such a place, of the prisoners in it: for which purpose it commands them to meet at such a place, at the time they themselves shall appoint; and informs them, that, for the same purpose, the king hath appointed his sheriff of the same county to bring all the prisoners of the gaol, and their attachments, before them at the day appointed. The justices of gaol-delivery are empowered by the common law to proceed upon indictments of felony, trespass, &c. and to order to execution or reprieve: they may likewise discharge such prisoners, as on their trials are acquitted, and those against whom, on proclamation being made, no evidence has appeared: they have authority to try offenders for treason, and to punish many particular offences, by statute 3 *Hawk.* 24. 2. *Hale's Hist. Placit. Cor.* 35.

(3.) * **GAOLER.** *n. f.* [from *gaol*.] Keeper of a prison; he to whose care the prisoners are committed.—

This is a gentle provost; seldom, when
The steel'd *gaoler* is the friend of men. *Shak.*
I know not how or why my surly *gaoler*,
Hard as his irons, and insolent as pow'r
When put in vulgar hands, Cleanthes,
Put off the brute. *Dryden's Cleomenes*.

—From the polite part of mankind she had been banished and immured, 'till the death of her *gaoler*. *Tatler*.

(4.) **GAOLERS.** Sheriffs are to make such gaolers for whom they will be answerable: but if there be any default in the gaoler, an action lies against him for an escape, &c. yet the sheriff is most usually charged; 3 *Inst.* 592. Where a gaoler kills a prisoner by hard usage, it is felony; 3 *Inst.* 52. No fee shall be taken by gaolers, but what is allowed by law, and settled by the judges, who may determine petitions against their extortions, &c. 3 *Geo. II. c.* 22.

GAONS, a certain order of Jewish doctors, who appeared in the East, after the closing of the *d.* The word *Gaons* signifies *excellent*, or as in the divinity schools we formerly *be, Sublime, Resolute, Angelic*, and The Gaons succeeded the *Sab-* about the beginning of the 6th

century. Chanah Meischtia was the first of the Gaons. He restored the *Pandebita*, which had been shut up for

(2.) * **GAP.** *n. f.* [from *gap*.] 1. A in a broken fence.—

Behold the despair,
By custom and covetous pates,
By *gaps* and openings of gates. *To*
With terrors and with furies to t
And crystal wall of heav'n; which
wide,

Roll'd inward, and a spacious *gap* d
Into the wasteful deep. *Milton*

—Bushes are most lasting of any for de or to mend *gaps*. *Mort. Husb.*—I thought says God, that should make up the l stand in the *gap* before me, for the l should not destroy it. *Rogers.* 1. A The loss of that city concerned the Chs monweal; manifold miseries afterwards the opening of that *gap* to all that side c dom. *Knolles.* 3. Any passage.—

So stands the Thracian herdsman
Spear

Full in the *gap*, and hopes the hunts
And hears him rushing in the wood.

4. An avenue; an open way.—The fo of England passed into them a great p prerogatives; which though then it w tended, and perhaps well deserved, yet a *gap* of mischief lies open thereby, t with it were well stop. *Spenser.* 5. deficiency.—If you violently proceed, mistaking his purpose, it would make in your honour. *Shak. K. Lear.*—No botch or *gap* in the works of nature.

Any interstice; a vacuity—

Each one demand, and answer to
Perform'd in this wide *gap* of time,
We were dissolv'd. *Shak. Wn*

—That I might sleep out this great *g* My Anthony is away. *Shak. Ant. Cleo*

To make 'twixt words and lines b
Wide as meridians in maps.

—One can revive a languishing conver sudden surprising sentence; another is terous in seconding; a third can fill with laughing. *Swift.* 7. An opening of in speech during the pronunciation of five vowels.—The hiatus, or *gap* bet words, is caused by two vowels openi other. *Pope.* 8. To *stop a GAP*, is to some mean shift: alluding to hedges in dead bushes, 'till the quicksets will gr

His policy consists in setting traps
In finding ways and means, and *stop*

9. To *stand in the GAP*. To make d expose himself for the protection of so danger.—What would become of the

re none more concerned for her rights
? Who would stand in the Gap? *Lesley.*

GAPE. *v. n.* [*gapan*, Saxon.] 1. To
mouth wide; to yawn.—

men there are love not a gaping pig;
that are mad, if they behold a cat.

Shakeſp.

or yawning, and stretching, do pass from
in; for that that causeth gaping and
is when the spirits are a little heavy
pour. *Arbutnot.*—

retches, gapes, unglues her eyes,
as if it be time to rise.

Swift.

in the mouth for food, as a young bird.

As callow birds,
mother's kill'd in seeking of the prey,
heir nest, and think her long away;
each leaf that stirs, each blast of wind,
the food which they must never find.

Dryden.

a drought the thirsty creatures cry,
upon the gather'd clouds for rain,
first the martlet meets it in the sky,
th wet wings joys all the feather'd train,

Dryden.

re earnestly; to crave: with *for*.—
er grim death appears in all her shapes;
agry grave *for* her due tribute gapes.

Denham.

my fortune be not thou a slave;
it hath thou to fear beyond the grave?
who gap'ſt *for* my estate, draw near;
ould whisper somewhat in thy ear.

Dryden.

Her.—What shall we say of those who
days in gaping after court favour and
is? *L'Eſt.* 5. With *at*.—Many have
the church revenues; but, before they
low them, have had their mouths stop-
e church-yard. *South.* 6. To open in
holes.—

flume my noble father's person,
k to it, altho' itself should gape

me hold my peace. *Shak. Hamlet.*
that ground gape, and swallow me alive,
I shall kneel to him that slew my father.

Shak. Hen. VI.

at horse-muffel, with the fine shell, doth
rut as the oysters do. *Bacon's Nat. Hist.*
eption of one is as different from the
of the other, as when the earth falls
r the incisions of the plough, and when
d greedily opens itself to drink in the
aven, or the refreshments of a shower.
be mouth of a little artery and nerve
the cavity of these vessels. *Cheyne's*

7. To open with a breach.—

lanks, their pitchy coverings wash'd a-
r,
ld, and now a yawning breach display:
ring waters, with a hostile tide,
ro' the ruins of her gaping side. *Dryd.*

these actions can be performed by ali-
vell as medicines, is plain; by observing
of different substances upon the fluids
when the vessels are open and gape by a
Robert. 8. To open; to have an hiatus.
not, to the best of my remembrance,

one vowel gaping on another for want of a cæsuræ
in this poem. *Dryden.* 9. To make a noise with
open throat.—

And, if my muse can thro' past ages see,
That noisy, nauseous, gaping fool is he. *Rosce.*
10. To stare with hope or expectation.—

Others will gape t' anticipate
The cabinet designs of fate;
Apply to wizards, to foresee

What shall, and what shall never be. *Had.*
11. To stare with wonder.—Parts of different spe-
cies jumbled together, according to the mad ima-
gination of the dawber; and the end of all this to
cause laughter: a very monster in a Bartholomew
fair, for the mob to gape at. *Dryd. Duſt.*—

Where elevated o'er the gaping crowd,
Clasp'd in the board the perjurd head is bow'd,
Betimes retreat. *Gay's Trivia.*

12. To stare irreverently.—They have gaped upon
me with their mouth. *Job. xvi. 30.*

GAPENCOIS, a ci-devant county of France,
in the prov. of Upper Dauphiny, 27 miles long
and 18 broad. Gap was the capital. It is now
included in the dept. of Upper Alps.

GAPENNES, a town of France in the dept.
of Somme, 7 miles NE. of Abbeville.

* **GAPER.** *n. s.* [from *gape*.] 1. One who
opens his mouth. 2. One who stares foolishly.
3. One who longs or craves.—The golden shower
of the dissolved abbey lands rained well near into
every gaper's mouth. *Carew's Survey.*

GAPSAL, a town of Russia, 36 miles SW. of
Revel.

* **GAP TOOTHED.** *adj.* [*gap* and *toothed*.]
Having interstices between the teeth.—The reeve,
miller, and cook, are distinguished from each o-
ther, as much as the mincing lady prioress and
the broad speaking gap-toothed wife of Bath. *Dryd.*
Fab. Pref.

(1.) * **GAR**, in Saxon, signifies a weapon;
so *Edgar* is a happy weapon; *Ethelgar*, a noble
weapon. *Gibson's Camden.*

(2.) **GAR**, or **HORN-FISH.** See **ESOX.**

* **To GAR.** *v. a.* [from *giera*, Icelandick.] To
cause; to make. Obsolete. It is still used in
Scotland.—

Tell me, good Hobbino!, what *gars* thee greet?
What! hath some wolf thy tender lambs yteorn?

Or is thy bagpipe broke, that sounds so sweet?
Or art thou of thy loved lass forlorn. *Spens.*

GARA, or **LOUGH GARA**, a lake of Ireland,
in Sligo county, 20 miles S. of Sligo.

GARABUSA, an island in the Mediterranean,
near the W. coast of Candia, taken by the Turks
in 1692. Lon. 41. 8. E. Lat. 35. 36. N.

of Persia, near the mouth of the Euphrates.

GARAMA, in ancient geography, the capital of
the Garamantes in Lybia Interior; near the spring
of the Cinyphus, now in ruins. It lay S. of Gætulia,
extending from the springs of the Cinyphus, and
the Gir, to the mountains which form at the *Val-*
lis Garamantica, (Pliny): or from the springs of
the Bagradas to the lake Nuba, (Ptolemy)

GARA.

See GARAMA.

Garde, a very ingenious letter-founder, who began, in Paris; where he began, in 1564, to set his printing types, free of the Gothic, or (as it is called) black letter, and brought it to such perfection, that he had the glory of it before him, and of being scarcely ever excelled by his successors in that useful art. His types were prodigiously multiplied: both by the great number of matrices he struck, and the types founded in resemblance of his in all parts of Europe. Thus in Italy, Germany, England, and Holland, the booksellers by way of recommending their books, distinguished the types by his name; and in particular, the small Roman was by way of excellence known among the printers of these nations by the name of *Garmond's small Roman*. By the special command of K. Francis I. he founded three sizes of Greek types for the use of Robert Stephens, who with them printed all his beautiful editions of the New Testament, and other Greek authors. He died at Paris in 1561.

GARAN, an island of Scotland, on the coast of Sutherland, 3 miles ESE. of Cape Wrath.

GARASSE, France, a remarkable jesuitical writer, the first author of that irreconcilable enmity which so long subsisted between the Jesuits and Janseuists, in the church of Rome, was born at Angoulême, in 1585, and entered the Jesuits college in 1600. As he had a quick imagination, a strong voice, and a peculiar turn to wit, he became a popular preacher in the chief cities of France; but distinguished himself still more by his writings, which were bold, licentious, and produced much controversy. The most considerable in its consequence was intitled *La somme theologique des vertus capitales de la religion Chretienne*; which was first attacked by the abbot of St Cyran, who observing in it a prodigious number of falsifications of the scriptures and of the fathers, besides many heretical and impious opinions, conceived the honour of the church required him to undertake a refutation. Accordingly he published a full answer to it; while Garasse's book was also under examination of the doctors of the Sorbonne, by whom it was afterwards condemned. Garasse replied to St Cyran; but the Jesuits were forced to remove their brother to a distance from Paris; where, probably weary of his inactive obscurity, when the plague raged at Poitiers, in 1631, he begged leave of his superiors to attend the sick, in which charitable office he was infected and died.

GARAUP, a Cape of France, in the dept. of Var, and ci-devant prov. of Provence, near Antibes. It runs far into the sea and forms the bay of Cannes.

GARAZU, a town of Brazil, 25 miles N. of Olinda.

* GARB. *n. f.* [*garbe*, French.] 1. Drefs; cloaths; habit.—

Thus Belial, with words of reason's garb,

Counsel'd ignoble ease and peaceful sloth.

INIA, in botany; a genus of the mon-der, belonging to the dodecandria class and in the natural method ranking un-der order, *Sicernes*. The calyx is tetra-ferior; there are 4 petals; the berry is ous, and crowned with a shield-like There is but one species; viz.

MA NGOSTANA, a tree of great ele- producing the most pleasant fruit of own. See *Plata CLX, fig. 4*. This been very accurately described by Dr n honour of whom, Linnaeus gave it the the 35th vol. of the *Philos. Transf.* It informs us, to about 17 or 18 feet high, straight taper stem like a fir," having a it in form of an oblong cone, composed ranches and twigs, spreading out equal- sides without leaving any hollow. Its

oblong, pointed at both ends, entire, f a shining green on the upper side, and e on the back. Its flower is composed almost round, or a little pointed; their embles that of a rose, only deeper and . The calyx of this flower is of one anded, and cut into 4 lobes. The two es are something larger than the lower y are greenish on the outside, and of p red within: the red of the upper ones ily than that of the lower ones. This

loses all the parts of the flower; it is by a pedicle, which is green, and con- mes out of the end of a twig above the of leaves. The fruit is round, of the small orange, from an inch and an half ches diameter. The body of this fruit is of one cavity, composed of a thick rind, ke that of a pomegranate, but softer, nd fuller of juice. Its thickness is com- a quarter of an inch. Its outer colour

brown purple, mixed with a little grey green. The inside of the peel is a rose ad its juice is purple. This skin is of a - astringent taste, like that of a pome- nor does it stick to the fruit it contains. e of this fruit is a furrowed globe, divid- gments, like those of an orange, but un- size, and not adhering to each other.

ber of these segments is always equal to e rays of the top which covers the fruit. r there are of these segments; the bigger There are often in the same fruit leg- big again as any of those that are on the :m. These segments are white, a little it, fleshy, membranous, full of juice like r raspberries, of a taste of strawberries s together. Each of the segments in- ect of the figure and size of an almond s. These seeds are covered with two s, the outermost of which serves for a be filaments and membranes of which is composed. The substance of these

PART I.

seeds comes very near to that of chestnuts, as to their consistency, colour, and astringent quality.

"This tree (says Dr Garcin,) originally grows in the Molucca islands, where it is called *mangostan*, but has been transplanted from thence to the islands of Java and Malacca, at which last place it thrives very well. Its tuft is so fine, so regular, so equal, and the appearance of its leaves so beautiful, that it is at present looked upon at Batavia as the most proper for adorning a garden and affording an agreeable shade. There are few seeds, however, to be met with in this fruit that are good for planting, most part of them being abortive." He adds, that one may eat a great deal of this fruit without any inconvenience; and that it is the only one which sick people may be allowed to eat without any scruple. Other writers concur in their praises of this fruit. Rumphius observes, that the mangostan is universally acknowledged to be the best and wholesomest fruit that grows in India; that its flesh is juicy, white, almost transparent, and of as delicate and agreeable a flavour as the richest grapes; the taste and smell being so grateful, that it is scarce possible to be cloyed with eating it. He adds, that when sick people have no relish for any other food, they generally eat this with great delight; but, should they refuse it, their recovery is no longer expected. "It is remarkable (says he) that the mangostan is given with safety in almost every disorder. The dried bark is used with success in the dysentery and tenesmus; and an infusion of it is esteemed a good gargle for a sore mouth or ulcers in the throat. The Chinese dyers use this bark for the basis of a black colour, to fix it the firmer." Captain Cook, in his *Voyage round the World*, vol. iii. p. 737, says this tree is peculiar to the East Indies. The fruit is about the size of the crab-apple, and of a deep red wine colour. On the top of it is the figure of 5 or 6 small triangles joined in a circle; and at the bottom several hollow green leaves, which are remains of the blossom. When they are to be eaten, the skin or rather flesh must be taken off; under which are found 6 or 7 white kernels, placed in a circular order; and the pulp with which these are enveloped is the fruit, than which nothing can be more delicious. It is a happy mixture of the tart and the sweet, which is no less wholesome than pleasant; and, like the sweet orange, is allowed in any quantity to those who are afflicted with putrid or inflammatory fevers.

GARCON, or **GARSOON**, a French term, literally signifying a boy, or young man unmarried, applied to certain inferior officers, among us called *grooms*, *garçones*. Thus all the servants in the late French king's chambers, wardrobe, &c. who held the lesser offices thereof under the proper officers, were called *garçons de la chambre, de la garderobe*, &c.

(1.) * **GARD**. *n. f.* [*garde*, French.] Ward-ship; care; custody.

(2.) **GARD**, in geography, a department of France, comprehending part of the ci devant province of Languedoc. It is bounded on the N. by the departments of Lozere and Ardeche; on the E. by the Rhone; on the S. by the Mediterranean, and

he made his mercantile friend a present. The same liberal principles of public philanthropy led him to give 300l. to the Society for the Borough reform, as well as a sum to the Association for the Abolition of the African Slave Trade: in which last he took a zealous and active part, by attending at several of the Society's first public meetings in Edinburgh, and signing their addresses and resolutions in the Newspapers. On Sept. 1786, he set out for Dover, on his way to France. After visiting Paris, he went to Provence, and spent the winter at Aix. In spring 1787, he returned northwards; he visited Geneva, Switzerland, the Netherlands, and the Provinces; passed through Germany, and having surveyed all its great cities, numerous monuments of its ancient as well as its many natural curiosities, returned to his native country, in 1789, after an absence of 3 years, in much better health than when he left it. He died at his seat at Moray, Edinburgh, on the 21st July 1793, at the age of 57 years. With regard to his person, he was above the middle size, robust and healthy, and as to his dress, Diogenes himself was his model. His manners were highly polished, and his conversation was highly interesting. Of his comprehensive genius, and excellent classical taste as an author, a few writings he has published afford evidence. His *Travelling Memorandums*, are evidently written "on the spur of the moment," and discover not only just observation on all subjects which occurred to his recollection, but an acquaintance with the best authors, a talent for composition, and a gayety of fancy, which never fails to please. His *Criticisms on English Historians* appear to be impartially just and striking; though some might be thought to favour of democratic principles. His *Letter to the Inhabitants of Moray* exhibits a mind animated with the truest and philanthropic desire to promote the welfare of his rising village;—free from the taint of liberal prejudice, yet under the strong influence of the wisdom and goodness of the British government of the universe, and a full view of the infinite advantages which man derives from Revelation. Beside these acknowledgments, his lordship wrote many anonymous poems in prose and verse, which were published in his younger years in different periodicals, and which, it is to be regretted, have been collected and reprinted. Being a great admirer of *Spenser*, he began a series of Critical Poems, in the *Gentleman and the Gentlewoman*, published at Edinburgh in 1774, and stopping of that work at the end of the year, he put an end to his lordship's criticisms in that poem, and he never resumed them in any other form. As a public speaker his lordship's eloquence was natural and energetic. There was a variety and modulation in the tone of his voice, which attracted attention and delighted the

hearers. We cannot close this brief memoir, which want of room only obliges us to shorten, without mentioning, that the erection of St Bernard's well near Edinburgh, upon the model of the Temple at Tivoli in Italy, for the benefit of the health of the citizens of that metropolis, will afford a lasting monument of lord Gardenstone's taste, as well as of his public spirit. See *BERNARD'S WELL, ST.*

(2.) * GARDEN. *n. s.* [*gardd*, Welsh; *jardin*, French; *giardino*, Italian.] 1. A piece of ground inclosed, and cultivated with extraordinary care, planted with herbs or fruits for food, or laid out for pleasure.—

Thy promises are like Adonis' gardens,
Which one day bloom'd and fruitful were the
next. *Shak.*

My lord of Ely, when I was last in Holbourn,
I saw good Strawberries in your garden there.

Shak. Rich. III.

—In the royal ordering of gardens, there ought to be gardens for all the months in the year. *Bacon.*

—In every garden should be provided flowers, fruit, shade and water. *Temple.*

My garden takes up half my daily care,
And my field asks the minutes I can spare.

Harte.

2. A place particularly fruitful or delightful.—

I am arriv'd from fruitful Lombardy,

The pleasant garden of great Italy. *Shak.*

3. GARDEN is often used in composition for *border*, *tenants*, or belonging to a garden. 4. *Garden-mould*. Mould fit for a garden.—They delight most in rich black garden-mould, that is deep and light, and mixed rather with sand than clay. *Mortimer.* 5. *Garden-tillage*. Tillage used in cultivating gardens.—Peas and beans are what belong to garden-tillage as well as that of the field. *Mort. Husb.* 6. *Garden-ware*. The produce of gardens.—A clay bottom is a much more pernicious soil for trees and garden-ware than gravel. *Mort. Husb.*

(3.) GARDEN. See GARDENING.

(4.) GARDEN BAY, a bay on the E. coast of Newfoundland. Lon. 54. 50. W. Lat. 49. 42. N.

(5.) GARDENS, FLOATING. Abbé Clavigero, in his *History of Mexico*, says, that when the Mexicans were brought under subjection to the Colhuan and Tepanecan nations, and confined to the miserable little islands on the lake of Mexico, they had no land to cultivate, until necessity compelled them to form moveable fields and gardens, which floated on the waters of the lake. The method which they adopted, to make these, and which they still practise, is extremely simple. They plait and twist together willows and roots of marsh plants or other materials, which are light, but capable of supporting the earth firmly united. Upon this foundation they lay the light bulrushes which float on the lake; and over all, the mud and dirt which they draw up from the bottom. Their regular figure is quadrangular; their length and breadth various; but generally they are about 8 perches long, and not more than 3 in breadth, and have less than a foot of elevation above the surface of the water. These were the first fields which the Mexicans had after the foundation of Mexico.

that capital.

...plants thrive in them surpris-
ly; the mud of the lake affords a very fertile soil,
and requires no water from the clouds. In the
large gardens there is commonly a little tree, and
even a little hut to shelter the cultivator and de-
fend him from rain or the sun. When the *Chi-
nampa*, or owner of a garden, wishes to change
his situation, to remove from a disagreeable neigh-
bour, or to come nearer to his own family, he
gets into his little vessel, and by his own strength
alone if the garden is small, he tows it after him,
and conducts it wherever he pleases. That part
of the lake, where these floating gardens are, is a
place of high recreation, where the senses receive
all possible gratification.

(6.) GARDENS, HANGING, in antiquity, gardens
raised on arches by Nebuchadnezzar king of Ba-
bylon, to gratify his wife Amyctis, daughter of
Astyages king of Media. Q. Curtius makes them
equal in height to the walls of the city, viz. 50
feet. They contained a square of 400 feet on
every side, and were carried up into the air in
several terraces laid above one another, and the
ascent from terrace to terrace was by stairs 10 feet
wide. The arches sustaining the whole pile were
raised above one another, and it was strengthened
by a wall, surrounding it on every side, of 22 feet

in thickness. The floors of each of
the arches were first laid large flat
long and 4 broad. Over them was a
mixed with a great quantity of bit
which were two rows of bricks clost
together by plaster, and over all wa

INTRODUCTION.

SECT. I. DEFINITIONS.

GARDENING is thus defined by Dr John-
son:

* GARDENING. *n. s.* [from *garden*.] The act
of cultivating or planning gardens.—My compo-
sitions in *gardening* are after the Pindarick man-
ner, and run into the beautiful wildness of nature,
without affecting the nicer elegancies of art. *Spee*

In the preceding definition, Dr Johnson is ma-
nifestly deficient. GARDENING is an ART, which
comprehends a great variety of *arts*, both of the
planning and cultivation of gardens. Considered
in its utmost extent, whatever contributes to ren-
der the scenes of vegetable nature delightful, forms
a part of gardening; but in its more limited sense,
it denotes the cultivation of gardens for the sake
of their produce. In this last sense, as the most
important, we mean chiefly to treat of it.

SECT. II. HISTORY of GARDENING.

GARDENING, says Mr Walpole, in his *History*

of Modern Gardening, was probabl
first arts that succeeded to that of bu
and naturally attended property an
possession. Culinary, and afterwa
herbs, were the objects of every hea
it became convenient to have them
without seeking them at random i
meadows, and on mountains, as
were wanted. When the earth cea
spontaneously all those primitive lux-
ture became requisite, separate inclo-
ing herbs grew expedient. Fruits
same predicament; and those most i
demanded attention, must have ext
extended the domestic inclosure.

NOAH planted a vineyard, and
wine, and every body knows the
Thus we acquired vineyards, as w
gardens, and orchards. No doubt
of all these sorts was the garden of E
radite was a great deal larger than a
read of afterwards, being inclosed
Pison, Gihon, Hiddekel, and Euphr
ry tree that was pleasant to the sigh

er in it; and as two other trees were like-
 und there, of which not a slip or sucker
 s; it does not belong to the present dis-
 . After the Fall, nobody was suffered
 r into the garden; and the poverty and
 ies of our first ancestors hardly allow-
 m time to make improvements in imita-
 it, supposing any plan had been prefer-
 A cottage and a slip of ground for a cab-
 and a gooseberry-bush, such as we see by the
 a common, were in all probability the ear-
 sts and gardens: a well and bucket succeed-
 the Pilon and Euphrates. As settlements in-
 d, the orchard and the vineyard followed;
 e earliest princes of tribes possessed just the
 aries of a modern farmer.

ters, we may well believe, remained long in
 tuation; and we have reason to think, that
 any centuries the term *garden* implied no
 than a kitchen garden or orchard. The
 s of ALCINOUS, in the *Odyssey*, is the most
 med in the heroic times. No admirer of
 r can read his description without rapture.
 continues our author, what was that boast-
 radise with which

the gods ordain'd

grace Alcinous and his happy land?
 diverted of harmonious Greek and bewitch-
 etry, it was a small orchard and vineyard,
 some beds of herbs and two fountains that
 ed them, inclosed within a quick-set hedge.
 hole compass of this pompous garden in-
 four acres:

acres was th' allotted space of ground,
 d with a green inclosure all around.
 es were apples, figs, pomegranates,
 olives, and vines. Alcinous's garden was
 d by the poet, enriched by him with the
 gift of eternal summer, and no doubt an
 of imagination surpassing any thing he
 ever seen. As he has bestowed on the same
 y prince a palace with brazen walls and co-
 s of silver, he certainly intended that the gar-
 d should be proportionably magnificent. We
 are, therefore, that, as late as Homer's age,
 nclosure of 4 acres, comprehending orchard,
 yard, and kitchen garden, was a stretch of
 y the world at that time had never beheld,"
 ere this era, however, we have in the sacred
 s hints of a garden still more luxuriously
 ed. We allude to the Song of Solomon,
 p. ii. v. 1.) part of the scene of which is un-
 edly laid in a garden. Flowers and fruits
 particularly spoken of as the ornaments and
 produce of it; and besides these, aromatic ve-
 gables formed a considerable part of the gratifi-
 cations it afforded. The camphor and the cinna-
 m tree, with all trees of frankincense, and
 the chief spices flourished there, (Cant. iv. 13.)
 LONDON tells us, (Eccl. ii. 4, 5.) That he made
 great works;—gardens and orchards, and
 d in them trees of every kind. Indeed we
 suppose his gardens to have been both amp-
 ly and curiously furnished, seeing the kinds, na-
 ture, and properties of the vegetable tribes, were
 his favorite study with the royal philosopher, and
 he deemed a subject worthy of his pen: for we
 are told, that he wrote of plants, from the great

cedar of Lebanon down to the hyssop of the wall.
 (2 Kings iv, 33.) Fountains, and streams of water
 appear also to have had a share in the composition;
 probably for ornament as well as use.

The HANGING GARDENS of Babylon were a
 still greater prodigy. But as they are supposed to
 have been formed on terraces and the walls of the
 palace, whither soil was conveyed on purpose, Mr
 Walpole concludes, "they were what sumptuous
 gardens have been in all ages till the present, un-
 natural, enriched by art, possibly with fountains,
 statues, balustrades, and summer-houses, and
 were any thing but verdant and rural." Others,
 however, have allowed them greater praise.
 They seem, in many respects, to have been laid
 out with good taste. Their elevation not only
 produced a variety and extent of view, but was
 also useful in moderating the heat. Such a si-
 tuation would likewise suit a greater variety of
 trees and plants than a plain surface, and would
 contain a larger as well as a more diversified ex-
 tent.

The suiting of the situation to the nature of the
 trees seems, from the account given by Josephus,
 (*Contra Apion*, lib. i. § 19.) to have been one view
 in the erecting the building in such a manner.
 And the success seems to have been answerable,
 as the trees (says Quintus Curtius, lib. 5.) flourish-
 ed extremely well, and grew as tall as in their na-
 tive situations. On the whole, they seem to have
 been formed with judgment and taste, and well
 adapted to the situation and circumstances.

The eastern gardens appear to have been plant-
 ed adjoining to the house or palace to which they
 belonged. Thus, king Ahasuerus went immedi-
 ately from the banquet of wine to walk in
 the garden of the palace. Esther, vii. 7. The
 garden of CYRUS, at Sardis, mentioned by Xeno-
 phon, seems to have been contiguous to the pa-
 lace; as was that of ATTALUS, mentioned by
 Justin. l. 36. c. 4. The hanging gardens at Ba-
 bylon, were not so much adjacent to the palace,
 as a part of the palace itself. since several of the
 royal apartments were beneath them. *Diod.* lib. 2.

We are not certain what the taste for gardening
 was among the Greeks. The ACADEMUS was a
 wooded shady place; and the trees appear to
 have been of the olive species. It was situated be-
 yond the limits of the walls, and adjacent to the
 tombs of the heroes; and tho' we are not inform-
 ed of the particular manner in which this grove
 was laid out, it may be gathered from Pausanius's
Attica, that it was elegantly ornamented. At the
 entrance was an altar dedicated to Love. Within
 the Academus, were the altars of Prometheus, the
 Muses, Mercury, Minerva, and Hercules; and
 at a small distance was the tomb of Plato. So
 that, in all probability, it was highly adapted by
 art, as well as nature, to philosophic reflection
 and contemplation.

PLUTARCH tells us, that before the time of Ci-
 mon, the Academus was a rude and uncultivated
 spot: but that it was planted by that general, and
 had water conveyed to it. It was divided into gym-
 nasia, or places of exercise, and philosophic walks,
 shaded with trees. These are said to have flourish-
 ed very well, until they were destroyed by Sylla,
 along with those in the Lyceum. Near the aca-
 demy

GARDENING.

SACR.

were the gardens of the philosophers, of which Epicurus; which, however, were but small. The scene of Plato's *Dial.* concerning Beauty is elegantly described as on the banks of the river Ilissus, and under shade of the plantane; but as no artificial arrangement of objects is mentioned, the prospect is to have been merely natural.

The art of gardening does not appear to have been among the Romans, otherwise than as a matter of utility, till a very late period; at least the writers on husbandry, Cato, Varro, Columella, and Palladius, make no mention of a garden as an object of pleasure, but solely with respect to its productions of herbs and fruits. The gardens of Lucullus are the first we find mentioned of remarkable magnificence; though indeed from the extravagance to which these were arrived, it is evident, they could not be the first. Plutarch speaks of them as incredibly expensive, and equal to the magnificence of kings. They contained artificial elevations of ground to a surprising height, of buildings projected into the sea, and vast pieces of water upon land. In short, his extravagance was so great, that he acquired the appellation of the *Roman Xerxes*. It is not improbable, from the consideration of Lucullus having spent much time in Asia, in a situation wherein he had an opportunity of observing the most splendid constructions of this kind, that these gardens might be laid out in the Asiatic style. The vast masses of building said to have been erected, might have borne some resemblance, in the arrangement and style, to the Babylonian gardens.

The *Tusculan Villa* of Cicero, though often mentioned, is nowhere described in his works, so as to give an adequate idea of the style in which his gardens were disposed.

Little is to be traced in Virgil relative to this subject. Pines, it seems probable, were a favourite ornament in gardens; (*Ecl.* vii. 65) and flowers, roses especially, were much esteemed, (*Georg.* iv. 218) perfumes indeed having been always highly valued in warm climates. Virgil places Anchises in Elysiun, in a grove of bays, of the sweet-scented kind. The Persian roses were chiefly valued for their excellent odour; and the same quality appears to be the cause why they were placed by Tibullus as ornaments to the Elysiun fields. There appears also to have prevailed among the Romans a piece of luxury relative to gardens, which is equally prevalent at present among us, namely, the forcing of flowers at seasons of the year not suited to their natural blowing: and roses were then, as at present, the principal flowers upon which these experiments were tried; as appears from Martial, Lampridius, and others. See *Epig.* l. vi. *co.* 80, &c.

When Roman authors, (Mr Walpole remarks,) whose climate infused a wish for cool retreats, speak of their enjoyments in that kind, they sigh for grottoes, caves, and the refreshing hollows of mountains, near irriguous and shady founts; or boast of their porticoes, walks of plants, canals, baths, and breezes from the sea. Their gardens are never mentioned as affording shade and shelter from the rage of the dog-star. Pliny

gives us descriptions of two of his villas. As he

used his Laurentine villa for his winter retreat, it is not surprising that the garden makes no considerable part of the account. All he says of that the *gestatio* or place of exercise, which surrounded the garden (the latter consequently being very large), was bounded by a hedge of vines, and where that was perished, with roses, that there was a walk of vines; and that among the trees were fig and mulberry, the soil being proper for any other sorts. On his Tusculan villa he is more diffuse; the garden makes a considerable part of the description.—and what the principal beauty of that pleasure ground was, exactly what was the admiration of this country about 60 years ago; box trees cut into many shapes, animals, letters, and the names of the maker, the artificer. In an age when architecture displayed all its grandeur, all its purity, and all its splendour, when arose Vespasian's amphitheatre, the temple of Peace, Trajan's forum, Domitian's baths, Adrian's villa, the ruins and vestiges of which excite our astonishment; a Roman consul, a friend of the emperor's friend, and a man of elegant taste and taste, delighted in what the most discerning scarcely admire in a college garden. All the ingredients of Pliny's corresponded exactly to those laid out by London and Wile on the principles. He talks of slopes, terraces, a canal, shrubs methodically trimmed, a marble basin, pipes issuing water, a cascade falling into the basin, by trees alternately planted with box and a straight walk, from whence issue paths there parted off by hedges of box and trees, with obelisks placed between every path. There wants nothing but the embroidery of flowers, to make a garden in the reign of the emperor serve for the description of one in that of William III. In one passage, however, Pliny seems to have conceived that natural irregularity to be a beauty: *in opere uroanismo, (say) he, velut illam rursus imitationem.* Something like a view was contrived amidst so much posited position. But the idea soon vanished, lived immediately enveloped the sight scene, and inscriptions in box again succeeded to compensate for the daring intrusion of nature.

In the paintings found at Herculaneum a few traces of gardens, as may be seen in the volume of the prints. They are small square enclosures, formed by trellis-work and espaliers, and regularly ornamented with vases, fountains, and cariatides, elegantly symmetrical, and proper for the narrow spaces allotted to the garden of a house in a capital city.

From these remarks, it appears how narrow and insensibly the idea of a kitchen garden grew into that which has for so many ages been generally termed a garden, and by our ancestors in the country distinguished by the name of a *pleasure garden*. A square piece of ground was originally parted off in early ages for the use of the farmer—to exclude cattle, and ascertain the produce; it was separated from the fields by a hedge, and pride and design of privacy increased, the garden was dignified by walls; and in climates where were not lavished by the ripening glow of sun and soil, fruit trees were assisted and sheltered from the surrounding winds by the like expedient; for

of luxuries, which have swelled into geometrics, have almost all taken their source in a simple fountain of reason.

Nature and prospect were thus excluded, the art of making square gardens inclosed, pomp and solitude combined to calling that might enrich and enliven the unanimated partition. Fountains, first for use, which grandeur loves to disguise out of sight, received embellishments of marbles, and at last, to contradict nature, were, tossed their waste of waters into rising columns. Art, in the hands of man, had at first been made a succedaneum in the hands of ostentatious wealth, it became a means of opposing nature; and the more perfected the march of the latter, the more sought its power was demonstrated. Directed by the line were introduced in winding streams, and terraces were hoisted in opposition to the facile slopes that immediately unite the valley to the hill. Balustrades beset precipitate and dangerous elevations, and steps rejoined them to the subjacent flat where the terrace had been dug. Vases and urns were added to the unnecessary balconies, and furnished the lifeless spot with mimic tions of the excluded sons of men. Thus pomp and expence were the constituent parts of sumptuous and selfish solitudes; and every movement that was made, was but a step from nature. The tricks of water-works were unwary, not to refresh the panting traveller, but to amuse the eye. The walks and parterres embroidered in patterns of mosaic, were but the childish endeavours of man to add novelty to reconcile greatness to a confined space.

When these impotent displays of false taste, were applied to the lovely wildness of nature, which nature has distinguished each variety of tree and shrub. The venerable romantic beech, the useful elm, even the circuit of the lime, the regular round yew, and the almost moulded orange were corrected by such fantastic admirers of art. The compass and square were of more use than the nursery-man. The meander, the quincunx, and the étoile, imposed unsatisfying sameness on every royal and garden. Trees were headed, and their sides painted green; many French groves seem green upon poles. Seats of marble, arbours, summer-houses, terminated every vista; and even where the space was too large to be being remarked at one view, was so effectual, as Pope observed,

—each alley has a brother,
If the garden just reflects the other,
Flowers were more defensibly subjected to the regularity. As Milton expressed it,
Leisure

In gardens took his pleasure.

At the garden of Marshal de Biron at Paris, containing six acres, every walk was buttoned on by lines of flower-pots, which succeeded in rows.

It does not precisely appear what our ancestors called a bower: it was probably an arbour;

sometimes it meant the whole fenced inclosure, and in one instance it certainly included a labyrinth. Rosamond's bower was indisputably of that kind; though whether composed of walls or hedges, we cannot determine. A square and a round labyrinth were so capital ingredients of a garden formerly, that in Du Cerceau's architecture, who lived in the time of Charles IX. and Henry III. there is scarce a ground plot without one of each.

In Kip's Views of the Seats of our Nobility and Gentry, we see the same tiresome and returning uniformity. Every house is approached by two or three gardens, consisting perhaps of a gravel walk and two grass plats or borders of flowers. Each rises above the other by two or three steps, and as many walls and terraces, and so many iron gates, that we recollect those ancient romances in which every entrance was guarded by giants or dragons. Yet though these and such preposterous inconveniences prevailed from age to age, good sense in this country had perceived the want of something at once more grand and more natural.

These reflections, and the bounds set to the waste made by royal spoilers, gave origin to Parks. They were contracted forests, and extended gardens. Hentzer says, that, according to Rous of Warwick, the first park was that at Woodstock. If so, it might be the foundation of a legend that Henry II. secured his mistress in a labyrinth: it was no doubt more difficult to find her in a park than in a palace, where the intricacy of the woods and various lodgings buried in covert might conceal her actual habitation. It is more extraordinary that, having so long ago stumbled on the principle of modern gardening, we should have persisted in retaining its reverse, symmetrical and unnatural gardens. That parks were rare in other countries, Hentzer, who travelled over great part of Europe, leads us to suppose, by observing that they were common in England. In France they retain the name, but nothing is more different both in compass and disposition. Their parks are usually square or oblong inclosures, regularly planted with walks of chestnuts or limes, and generally every large town has one for its public recreation.

“One man, one great man we had (continues Mr Walpole), on whom nor education nor custom could impose their prejudices; who, ‘on evil days though fallen, and with darkness and solitude compassed round’ judged that the mistaken and fantastic ornaments he had seen in gardens were unworthy of the Almighty hand that planted the delights of Paradise. He seems with the prophetic eye of taste to have conceived, to have foreseen modern gardening; as Lord Bacon announced the discoveries since made by experimental philosophy. The description of Eden is a warmer and more just picture of the present style than Claud Lorraine could have painted from Hagley or Stourhead. The first lines we shall quote exhibit Stourhead on a more magnificent scale:

Thro' Eden went a river large,
Nor chang'd his course, but thro' the shaggy hill
Pass'd underneath ingulph'd: for God had
thrown

That mountain as his garden mould, high rais'd
Upon the rapid current——

 Of stateliest view—

and then recollect, that the author of this sublime vision had never seen a glimpse of any thing like what he has imagined; that his favourite ancients had dropped not a hint of such divine scenery; and that the conceits in Italian gardens, and Theobalds and Nonfuch, were the brightest originals that his memory could turnish. His intellectual eye saw a nobler plan, so little did he suffer by the loss of sight. It sufficed him to have seen the materials with which he could work. The vigour of a boundless imagination told him how a plan might be disposed, that would embellish nature, and restore art to its proper office, the just improvement or imitation of it.

“Now let us turn to an admired writer, posterior to MILTON, and see how cold, how insipid, how tasteless is his account of what he pronounced a perfect garden. We speak not of his style, which it was not necessary for him to animate with the colouring and glow of poetry. It is his want of ideas, of imagination, of taste, that deserve censure, when he dictated on a subject which is capable of all the graces that a knowledge of beautiful nature can bestow. SIR WILLIAM TEMPLE was an excellent man; MILTON, a genius of the first order.

“We cannot wonder that Sir William declares in favour of parterres, fountains, and statues, as necessary to break the sameness of large grass-plats, which he thinks have an ill effect upon the eye, when he acknowledges that he discovers fancy in the gardens of Alcimus. Milton studied the ancients with equal enthusiasm, but not bigotry; and had judgment to distinguish between the want of invention and the beauties of poetry. Com-

pare his paradise with Homer's garden ascribed to a celestial design. For Sir just to observe, that his ideas center in a garden. He had the honour of country many delicate fruits, and he did not cite than disposing them to the best

“The best figure of a garden (say) a square or an oblong, and either undescending; they have all their beauties in the air, the view, make amends for the want of variety, which is very great in small gardens, by the terrace-walks, in level places, and the stone stairs that are one to the other. The perfectest garden I ever saw, either at home or that of Moor park in Hertfordshire, it about 30 years ago. It was made by the late Duke of Bedford, esteemed among the best of her time, and celebrated by Dr Johnson with very great eulogy, excellent for much cost; but greater sums may be expended without effect or honour, if they are in proportion to money, or ‘if nature is to be imitated;’ which I take to be the great rule in every thing else, as far as it is not only of our lives but of our joy; [We shall see how natural that ad was.] “Because I take the garden to have been in all kinds the most perfect, at least in the figure and disposition I ever have seen, I will ascribe it to those that meet with such a situation above the regard of common expense the side of a hill, upon which the but not very steep. The length where the best rooms and those of me are, lies upon the breadth of the great parlour opens into the middle gravel walk that lies even with it, as lie, as I remember, about 300 paces broad in proportion; the border set with laurels and at large distances, the beauty of orange trees out of flower. From this walk are three descents of steps, in the middle, and at each end a large parterre. This is divided by gravel walks, and adorned with and eight statues in the several quadrants of the terrace walk, are two fountains and the sides of the parterre are raised by large cloisters open to the garden, and the sides of stone, and terminating other summer houses even with which are paved with stone, and walks of shade, there being none whole parterre. Over these two cloisters are terraces covered with lead and fountains; and the passage into these airy of the two summer-houses at the end of the terrace walk. The cloister facing it is covered with vines, and would have served for an orange house, and the other for other more common greens, and not, been cast for that purpose, if gardening had been then in as much vogue. From the middle of this parterre by many steps flying on each side

between them, covered with lead, and the lower garden, which is all fruit-trees cut the several quarters of a wilderness, very shady; the walks here are all green, embellished with figures of shell rock-mountains, and water-works. If the hill ended with the lower garden, and the not bounded by a common way that high the park, they might have added a tier of all greens; but this want is supplied garden on the other side the house, all of that sort, very wild, shady, and with rough rock-work and fountains. This park when I was acquainted with it, and its place, I think, that I have seen in my before or since, at home or abroad.

unnecessary to add any remarks on this. Any man might design and build a garden, who had been born in and never of Holborn. It was not, however, peculiar to William Temple to think in that way. How many Frenchmen are there who love our gardens, and still prefer unnatural steps and shady cloisters covered with Nautre, the architect of the groves and Versailles, came hither on a mission to our taste. He planted St James's and Parks—no great monuments of his in-

farther justice to Sir William Temple, or omit what he adds: 'What I have best forms of gardens is meant only of in some sort regular; for there may be a wholly irregular, that may, for ought be more beauty than any of the others: we owe it to some extraordinary disposition in the seat, or some great race of judgment in the contrivance, which may by disagreeing parts into some figure, yet, upon the whole, be very agreeable. Nothing of this I have seen in some place more of it from others, who have among the Chinese, a people whose thinking seems to lie as wide of ours in Europe as our country does. Their greatest recreation is employed in contriving figures, beauty shall be great and strike the eye, without any order or disposition of parts, that is commonly or easily observed. And though hardly any notion of this sort of beauty, we find a particular word to express it: and find it hit their eye at first sight, they say awadgi is fine or is admirable, or any sign of esteem: but I should hardly adhere to these attempts in the figure of gardens, they are adventures of too hard attempt for any common hands; and though we more honour if they succeed well, more dishonour if they fail, and it is none they will; whereas in regular figures to make any great and remarkable

only Kent and a few others were not so, or we might still be going up and down the open air. It is true, we have lately, as Sir William Temple did, many imitations of nature in the gardens of the Chinese. The former is certainly

truly true: they are as whimsically irregular, as European gardens are formally uniform and unvaried:—but with regard to nature, it seems as much avoided, as in the squares and oblongs and straight lines of our ancestors. An artificial perpendicular rock starting out of a flat plain, and connected with nothing, often pierced through in various places with oval hollows, has no more pretension to be deemed natural than a lineal terrace or a parterre. The late Mr Joseph Spence, who had both taste and zeal for the present style, was so persuaded of the Chinese Emperor's pleasure-ground being laid out on principles resembling ours, that he translated and published, under the name of Sir Harry Beaumont, a particular account of that inclosure from the Collection of the Letters of the Jesuits. But except a determined irregularity, one can find nothing in it that gives any idea of attention being paid to nature. It is of vast circumference, and contains 200 palaces, besides as many contiguous for the eunuchs, all gilt, painted, and varnished. There are raised hills from 20 to 60 feet high, streams and lakes, and one of the latter five miles round. These waters are passed by bridges:—but even their bridges must not be straight—they serpentine as much as the rivulets, and are sometimes so long as to be furnished with resting-places, and begin and end with triumphal arches. The colonades undulate in the same manner. In short, this pretty gaudy scene is the work of caprice and whim, and, when we reflect on their buildings, presents no image but that of unsubstantial tawdriness. Nor is this all. Within this fantastic Paradise is a square town, each side a mile long. Here the eunuchs of the court, to entertain his imperial majesty with the bustle and business of the capital in which he resides, but which it is not of his dignity ever to see, act merchants, and all sorts of trades; and even delightedly exercise for his royal amusement every act of knavery that is practised under his auspicious government. Methinks this is the childish solace and repose of grandeur, not a retirement from public affairs to the delights of rural life. Here too his majesty plays at agriculture: there is a quarter set apart for that purpose; the eunuchs sow, reap, and carry in their harvest, in the imperial presence; and his majesty returns to Peking, persuaded that he has been in the country.

“Having thus cleared our way by ascertaining what have been the ideas of gardening in all ages, as far as we have materials to judge by, it remains to show to what degree Mr Kent invented the new style, and what hints he had received to suggest and conduct his undertaking.

“We have seen what Moor-park was, when pronounced a standard. But as no succeeding generation in an opulent and luxurious country contents itself with the perfection established by its ancestors, more perfect perfection was still sought; and improvements had gone on, till London and Wiltshire had stocked all our gardens with giants, animals, monsters, coats of arms, and mottoes, in yew, box, and holly. Absurdity could go no farther, and the tide turned. Bridgman, the next fashionable designer of gardens, was far more chaste; and whether from good sense, or that the nation had been struck by the admirable paper in the

Nº 173, he banished verdant sculpture, it even revert to the square precision of a line. He enlarged his plans, dis- make every division tally to its oppo- though he still adhered much to straight lines: the rest he diversified by wilder- d with loose groves of oak, though still surrounding hedges. As his reformation- ing, he ventured, in the royal garden- ond, to introduce cultivated fields, and- rfields of a forest appearance, by the sides- e endless and tiresome walks that stretched- one into another without intermission. was not till other innovators had broke- o from rigid symmetry.

The capital stroke, the leading step to all- s followed, was the destruction of walls- ndances, and the invention of fosses—an- et then deemed so astonishing, that the com- people called them Ha! Ha's! to express- surprise at finding a sudden and unperceived- to their walk.

A sunk fence may be called the *leading step*, these reasons. No sooner was this simple en- vement made, than levelling, mowing, and- s, followed. The contiguous ground of the

— without the sunk fence was to be harmoni- zed with the lawn within; and the garden in its- turn was to be set free from its prim regularity, that it might assort with the milder country with- out. The sunk fence ascertained the specific gar- den; but that it might not draw too obvious a- line of distinction between the neat and the rude, the contiguous out-lying parts came to be inclu- ded in a kind of general design; and when na- ture was taken into the plan, under improvements, every step that was made pointed out new beau- ties, and inspired new ideas. At that moment ap- peared Kent, painter enough to taste the charms of landscape, bold, and opinionative enough to dare and to dictate, and born with a genius to strike out a great system from the twilight of im- perfect essays. He leaped the fence, and saw that all nature was a garden. He felt the delicious contrast of hill and valley changing impercepti- bly into each other, tasted the beauty of the gentle swell or concave scoop, and remarked how loose groves crowned an easy eminence with happy or- naments; and while they called in the distant view between their graceful stems, removed and extended the perspective by delusive comparison.

“ Thus the pencil of his imagination bestowed all the arts of landscape on the scenes he handled. The great principles on which he worked were perspective, light, and shade. Groups of trees broke too uniform or too extensive a lawn; ever- greens and woods were opposed to the glare of the champaign; and where the view was less for- tunate, or so much exposed as to be beheld at once, he blotting out some parts by thick shades, to divide it into variety, or to make the richest scene more enchanting by reserving it to a farther advance of the spectator's eye. Thus, selecting favourite objects, and veiling deformities by screens of plantations, sometimes allowing the rudest walls to add its foul to the richest theatre; he recalled the compositions of the greatest masters

in painting. Where objects were wanting, he imitate his horizon, his taste as an architect be- low immediate termination. His lodges, seats, his temples, were more the work of the pencil than of his compasses. We owe the restoration of Greece and the diffusion of its texture to his skill in landscape.

“ But of all the beauties he added to the of this beautiful country, none surpassed the management of water. Adieu to canals, cataracts, fountains, and cascades tumbling down marble that last absurd magnificence of Italian and villas. The forced elevation of cataracts was more. The gentle stream was taught to glide seemingly at its pleasure; and where, continued by different levels, its course ap- peared to be concealed by thickets properly inter- and glittered again at a distance, where it was supposed naturally to arrive. Its borders smoothed, but preserved their waving irreg- A few trees scattered here and there on its banks sprinkled the same bank that accompa- meanders; and when it disappeared among hills, shades descending from the heights towards its progress, and framed the distance of light under which it was lost, as it turned to either hand of the blue horizon.

“ Thus, desiring in none but the colour of nature, and catching its most favourable moments, men saw a new creation opening before them. The living landscape was chastened or polished, transformed. Freedom was given to the trees: they extended their branches un- checked, and where any eminent oak, or master tree, escaped maiming and survived the forest, and bramble was removed, and all its branches were restored to distinguish and shade the landscape. Where the united plumage of an ancient tree extended wide its undulating canopy, and where the venerable in its darkness, Kent thinned the most tanks, and left but so many detached scattered trees, as softened the approach of the forest, and blended a chequered light with the lengthened shadows of the remaining colour.

“ Succeeding artists have added new strokes to these touches; perhaps, improve- ments brought to perfection some that have been. The introduction of foreign trees and plants, we owe principally to Archibald D. Argyle, who contributed essentially to the richness of colour peculiar to our modern landscape. The introduction of various greens, the contrast of forms between our forest trees and the northern and West- ern firs and pines, are improvements more recent to Kent, or but little known to him. The willow, and every florid shrub, each tree of a single cast or bold leaf, are new tints in the composition of our gardens.

“ But just as the encomiums are that have been bestowed on Kent's discoveries, he was without assistance nor faults. Mr Pope unduly contributed to form his taste. The design of the Prince of Wales's garden at Carlton was evidently borrowed from the Poet's Tem- ple. There was a little of affected modesty in the latter, when he said, of all his works, he was most proud of his garden. And yet it was a great effort of art and taste to impress so

very on a spot of five acres. The gh the gloom from the grotto to the the retiring and again assembling lusk groves, the larger lawn, and of the termination at the cypresses to his mother's tomb, are managed e judgment; and though Lord Peter- ed him

is quincunx, and to rank his vines, not the most pleasing ingredients of pective.

outed professed art (for the modern rts his talents to conceal his art,) ther reformers, knew not how to t limits. He had followed Nature,

ys which do not invite strangers to : their improvements."

ave brought down the history of this the present period. And from what , it must be evident, that GARDEN-

perfection to which it is now brought : entitled to a place of considerable the liberal arts. "It is, says Mr

s superior to landscape-painting as a representation: It is an exertion of ject for taste; and being realised now

r confined to the spots from which it ie; but regulates also the disposition

ments, of a park, a farm, a forest,

&c. and the business of a gardener is to select and apply whatever is great, elegant, or characteristic, in any of them to discover, or to show all the advantages of the place upon which he is employed; to supply its defects, to correct its faults, and to improve its beauties."

But though all these encomiums are justly due to gardening, upon the large scale of an ornamental garden, including a park, farm, forest, &c. yet we apprehend that enough has been said upon this subject here, and under the article FARM, § IV, 1—4. And therefore we shall restrict the remaining part of this treatise, to the description of such a plan of gardening, as will be found to answer best for those, who wish to prefer the *utile* to the *decor*, and to regard usefulness and convenience more than ornament.

SECT. III. *Of the CHOICE of GROUND for a GARDEN.*

IN the choice of a place proper for a garden, the most essential points to be considered are, the situation, the soil, the exposure, water, and prospect.

I. The situation ought to be such as is wholesome, and in a place neither too high nor too low; for if a garden be too high, it will be exposed to the winds, which are very prejudicial to trees; and if it be too low, the dampness, the vermin, and the venomous creatures that breed in ponds and marshy places, will add much to its insalubrity. The best situation is on the side of a hill, especially if the slope be easy, and almost imperceptible; if a good deal of level ground be near the house; and if it abounds with springs of water: for, being sheltered from the fury of the winds and the violent heat of the sun, a temperate air will be enjoyed; and the water that descends from the top of the hill, either from springs or rain, will not only supply fountains, canals, and cascades for ornament, but, when it has performed its office, will water the adjacent valleys, and, if it be not allowed to stagnate, will render them fertile and wholesome.

II. A good soil is next to be considered; for it is scarce possible to make a fine garden in a bad soil. There are indeed methods of meliorating ground, but they are very expensive; and sometimes, when the expence has been bestowed of laying good earth three feet deep over the whole surface, a whole garden has been ruined, when the roots of the trees have reached the natural bottom. To judge of the quality of the soil, observe whether there be any heath, thistles or such like weeds, growing spontaneously in it; for they are certain signs that the ground is poor. Or if there be large trees growing thereabouts, observe whether they grow crooked, ill shaped, and grubby; and if they be of a faded green, and full of moss, or infested with vermin: in all such cases, the place is to be rejected. But if it be covered with grass fit for pasture, the depth of the soil may be tried. To know this, dig holes in several places, six feet wide and four deep; and if there be three feet of good earth it will do very well, but less than two will not be sufficient. The quality of good ground is neither to be stony nor too hard to work; nei-

GARDENING.

SECT.

, too moist, nor too sandy and light; and clayey, which is the worst of gardens.

The next requisite is water; the want of one of the greatest inconveniences that a garden, and will bring a certain mortification whatever is planted in it, especially in drougths that often happen in a hot situation in summer; besides its usefulness gardens for making fountains, canals, &c. which are the greatest ornaments of

the last thing to be considered, is the propriety of a fine country: and though this is not absolutely necessary, yet it is one of the most agreeable qualities of a fine garden: Besides, if a garden is planted in a low place that has no kind of view, it will not only be disagreeable but unprofitable.

PART. IV. OF LAYING OUT and PLANTING GARDENS.

GARDENS are usually distinguished into FLOWER GARDENS, FRUIT GARDENS, and KITCHEN GARDENS. The first being designed for pleasure and ornament, should be placed in the most conspicuous part, that is, next to the back front of the house; and the two latter, being designed for use, should be placed less in sight. But though the fruit and kitchen gardens are here mentioned as distinct, yet they are now usually united; as they equally require a good soil and exposure, and should both be placed out of the view of the house.

In the laying out and planting of gardens, the beauties of nature should always be studied; for the nearer a garden approaches to nature, the longer it will please. According to Mr Miller, the area of a handsome garden may take up 30 or 40 acres, but no more; and the following rules should be observed in the disposition of it. There ought always to be a descent of at least three steps from the house to the garden; this will render the house more dry and wholesome, and the prospect on entering the garden more extensive. The first thing that ought to present itself to view should be an open lawn of grass; which ought to be considerably broader than the front of the building; and if the depth be one half more than the width, it will have a better effect: If on the sides of the lawn there are trees planted irregularly, by way of open groves, the regularity of the lawn will be broken, and the whole rendered more like nature.

For the convenience of walking in damp weather, this lawn should be surrounded with a gravel walk, on the outside of which should be borders 1 or 4 feet wide for flowers; and from the back of these the prospect will be agreeably terminated by a slope of ever-green shrubs; which, however, should never be suffered to exclude agreeable prospects, or the view of handsome buildings. These walks may lead through the different plantations, gently winding about in an easy natural manner; which will be more agreeable than either those long straight walks, too frequently seen in gardens, or those serpentine windings that are twisted about into so many short turns as to render it difficult to walk in them; and as no

garden can be pleasing where there is a want of shade or shelter, these walks should lead as far as possible into plantations, where persons may walk in private, and be sheltered from the sun.

Narrow rivulets, which have a constant flow, if they are judiciously led about the garden, will have a better effect than large stagnating ponds: Ponds so frequently made in large gardens, if they are intended, they should not be made into stars and other ridiculous figures, nor into mazes or labyrinths, which in a great measure appear trifling.

In a word, the several parts of a garden should be diversified; but in places where the eye is in the whole at once, the two sides should always be the same. In designs, the aim should always be at what is natural. The general disposition of a garden and of its parts ought to be accommodated to the different situations of ground, to humour its inequalities, to preserve the number of sorts of trees and shrubs in each part, and to shut out from the view of the garden no objects that may become ornaments: these extended views of the subject are not for present purpose.

A practical attention to a garden, is not to be esteemed a degrading employment. It is indeed, that pastoral and agricultural maxims we may form a judgment from the descriptions of Virgil, are greatly degenerated: employments of the shepherds and husbandmen are now become mean and sordid. The garden is usually left to a peasant. It is unreasonable to assign the labour, which, without amusement, to those who are fully amused by the prospect of their wages. The operations of grafting, of inoculating, of ingrafting, of transplanting, are curious experiments of natural philosophy; and that they are pleasant as well as curious, those can testify who have seen what they felt on seeing their attempts in the branches of practical gardening attended with success. Among the employments suitable to the age, Cicero has enumerated the superintendence of a garden. It requires no great exertion of mind or body; and its satisfactions are of a kind which please without violent agitation. A beneficial influence on health is an additional reason for an attention to it at an age when the mind is abroad.

In almost every description of the seats of the blessed, ideas of a garden seem to have prevailed. The word PARADISE is synonymous with garden. The fields of Elysium, that sweet scenes of poetry, were adorned with all that imagination can conceive to be delightful. Some of the pleasing passages of Milton, are those in which he represents the happy pair engaged in cultivating their blissful abode. Poets have always been delighted with the beauties of a garden. Lucretius is represented by Juvenal as reposing in his garden. Virgil's Georgics prove him to have been contented with rural scenes; though, to the surprise of his readers, he has not assigned a book to the subject of a garden. Seneca made it his subject (See FARM, § IV, 1) but, with all his fondness for it, he was not happy in it. The cultivating scenes which he created at the LAR

him, it is said, little pleasure in the aspectators. The truth is, he made the merit of his grounds, which should have amusement of his life, the business of it ; red himself in such troubles, by the excitation, as necessarily excluded tranquillity.

Indeed, in comparison, possess territories extensive, and sufficiently well adapted to an ornamented farm. Still fewer are of supporting the expence of preserving it in condition. But let not the rich suppose monopolized the pleasures of a garden. A plot of an acre, or a small portion, may afford real pleasure, from observing the progress of vegetation, even in a plantation of cultivated plants. A very limited tract, properly attended, will furnish ample employment for an individual. Nor let it be thought a mean care ; the hand that raised the cedar, formed the vine on the wall. Even the orchard, cultivated for advantage, exhibits beauties unobscured in shrubbery ; nor can the green-house afford an appearance to excel the blossom of the peach and the almond.

The kitchen garden ought to be situated on one side of the house, near the stables, from whence produce may be easily conveyed into it ; and against the wall, borders should be made of stone, which, according to Mr Miller, ought to be 10 feet broad. Upon these borders, exposed to the south, many sorts of early plants may be sown ; and upon those exposed to the north, may be sown some late crops, taking care not to plant any deep-rooting plants, especially peas, too near the fruit-trees.

Proceed to divide the ground into quarters of the best figures for these are a square or an oblong, if the ground will admit of it ; otherwise it may be of that shape which will be most advantageous. The size of these quarters should be proportioned to that of the garden ; if too small, they will be lost in walks, and the quarters enclosed by espaliers or fruit trees, the plants will grow up slender, for want of a more open exposure. The walks should also be proportioned to the size of the ground : these in a small garden should be 6 feet broad, but in a large one 8 or 10 feet on each side of the walk there should be a border 3 or 4 feet wide between it and the walk. In these borders may be sown small seeds or any other herbs that do not take deep roots ; but they should not be planted with the same plants two years.

The quarter nearest to the stables, and best sheltered from the cold winds, should be the hottest, for early cucumbers, melons, &c. and to it there should be a passage from the stables, or a gate through which a small cart may enter. The important points of general culture consist in digging and manuring the soil, and giving proper distance to each plant, according to their different growths : as also in keeping them free from weeds ; for which purpose, always observe to keep the dunghills free from them, or their seeds will be constantly brought in and mixed with the dung.

SECT. V. *The* GARDINER'S KALENDAR.

Under this head we proceed to point out what is proper to be done in the different months of the year, in the Kitchen-Garden, Flower-Garden, Orchard, &c. It is necessary, however, to mention here, that the arrangement in the following Kalendar, was originally drawn up for the climate of England ; but will suit those parts of Scotland where the climate is mild, equally well, upon allowing a difference of 10 or 12 days later for sowing or planting. Where the seasons are still more backward, a proportional allowance will be made by the judicious gardiner, or practitioner in this pleasant art.

JANUARY.

KITCHEN GARDEN. Asparagus, in this season, being one of the greatest rarities which the art of gardening affords, ought to be planted every month, to have a regular succession of it till April, as it is above 3 weeks before it will be fit to cut, and the 4th hotbed should now be made. Beans of the early Mazagan sort must be planted for the second crop. Beets and cabbages of every sort, intended to procure seed from, should now be planted, if it was omitted in October. Carrots, to draw young, for the first crop, should now be sown ; and those intended for seed should be planted. Cauliflower plants under glasses and frames should be covered with pea-straw, or mats, to defend them from the frost. Celery should be dug up as soon as the frost begins, for daily use, and the other covered with straw. Cress, mustard, radish, and rape, should be sown every week on a hotbed. Cucumbers for the first crop, to come in early in March, should now be sown. As soon as they are three or four days old put each into a small pot, and every week sow more to have plenty of plants. Dung should be wheeled into the kitchen garden in frosty weather, when other work cannot be done. Endive should be dug up, like the celery, as soon as the frost begins, and the rest covered with straw. Ground lying vacant should be dug up, if omitted in October, and thrown up into ridges. Hotbeds and loam should be prepared for asparagus, cucumbers and melons. Lettuces under glasses should be examined, and, if they be killed, sow more on a hotbed. Mint should be planted in pots, and if there be no hotbed, it will grow in a warm room. Mushroom beds will require regular attendance, and frost and rain must be kept out by dry straw and mats. Onions, to draw young, should be sown on a warm border. Peas under the south wall, for the first crop, should have the earth drawn up to them in a dry day, and sticks placed to them to defend them from the violence of the winds ; and sow the second crop. Plant asparagus for the 4th crop. Beans for the 2d crop of mazagans. Beets, Cabbages, carrots, parsneps for seed. Mint and potatoes on a hotbed. Onions for eschalions and seed. Radishes for the 2d crop, sow in a warm situation, and the first crop on a hotbed. Small sallading, as cress, mustard, rape, radishes, sow every week on a hotbed. Sow carrots for the first crop, and the second of peas. Sow on hotbeds, carrots and cucumbers for the first crop. Cress, mustard, radish,

radish, and rape for fallads: Sow likewise turneps.

FLOWER GARDEN and SHRUBBERY. Anemones which were planted in the autumn will require to be covered with pea-straw, rotten tan, or mats. Auricula and polyanthus seeds may now be sown in boxes or pots in mild weather. Auriculas should be sheltered from violent rains and frost by mats; and at the end of the month fresh earthed. Beds for bulbous roots should be digged and thrown up into ridges, that they may be planted the first fine weather, if any roots remain unplanted; but it is bad policy not to plant them in October or the beginning of November. Bulbous-rooted flowers in boxes or glasses should be removed in frosty weather, before night, from the windows; nor should they be set on chimney-pieces until they are in flower, for shade draws all flowers up very weak. Boxes made 5 inches deep, 8 wide, and 16 long, filled with light sandy earth, without any dung, are better than glasses, and will not require so much trouble. Stir up the earth often with a table fork. Carnations must be sheltered from violent rains and frost by mats. Plant at the end of the month, or sooner if the weather be mild, all sorts of bulbous roots, crocuses, as jonquils, narcissuses, polyanthus-narcissuses, snowdrops, tulips, &c. Plant flowering shrubs which are hardy, and flower early, as almonds, double-flowering cherries, honeysuckles, lilacs, mezerions, roses, &c. Shrubs and trees of all sorts may be planted at the end of this month. Sow auricula and polyanthus seeds in pots or boxes. Trenches should be cut to carry off the water, if it stands any where, after heavy rains.

FRUIT GARDEN and ORCHARD. Apple trees should be pruned as soon as the violent frosts are over. Espaliers ought always to be repaired before the buds of the trees begin to open. The fruit room should be often examined, to pick out all fruit which begins to decay; and nail mats before the windows to keep out the frost. Ground for planting should be prepared by digging the holes ready; and if wettish, a cart-load of good loam should be brought for each standard tree, and formed into a little hill before the tree be planted. Scrape off the moss from all fruit trees. Orchards in general are much neglected, by not cutting out the dead wood and branches that cross each other. Pear trees require pruning, both standards, espaliers, and against walls, as soon as the weather becomes mild. Prune currants, gooseberries, and raspberries. Strawberries in pots may be placed on hotbeds for forcing. Vines should not be pruned till towards the end of the month.

GREENHOUSE. Air may be given to the plants, if the weather be mild. Fire must be made if it freezes, and particularly when it begins to thaw, or if it is foggy weather, to dry the house; for dampness is as prejudicial as cold; and if there be no fire, light a few candles in frosty weather. To know for a certainty when it begins to freeze, set a pan of water near the windows. Leaves, which are any way decayed, should be constantly ~~bed off~~, particularly from the geraniums. Succulent plants, such as aloes, ficoides, &c. should have any water this month. Water for all ~~of plants~~ should be the softest that can be ~~the water~~ is the best; the chillness should

be taken off by letting it stand in the 1 days before it is used; and this month be given very sparingly. Windows in 1 ther should be kept very close, by pa of paper where the wind blows in, for tributes to the frost; and if the window covered with mats, take them down i time to admit the light; for if plants in the dark, their leaves will soon fall the outward door should be opened as possible; but, to have it proper, there another door leading through a shed.

FEBRUARY.

KITCHEN GARDEN. Asparagus sh the mats taken off the glasses, excep snows; for without light it will, not and the 5th and last crop should be 1 a hotbed. Beans of the early sorts m planted for the 3d crop, and at the e month the first crop of the large sorts, for, long-podded, &c. Sow Beets, t ground be digged very deep. Boorcc and broccoli will want earthing up, dead leaves be first picked off. Sow for the 2d crop of sugarloaf, and the fi and plant out those sown in August. S at the end of the month for the general a deep sandy soil. Cauliflowers under g be examined, all the dead leaves picke the earth stirred up. In mild weather air, and plant some out, leaving only strongest under each glass. Sow the 2d gentle hotbed. Sow cellery, for the fi a gentle hotbed, and draw earth up what remains in the ground, in dry weat coleworts, for the first crop: cress and every week on hotbeds. Cucumber be constantly attended to, to keep them u per heat, and another made for the pl last month: when they have 3 or 4 rou plant them out, 3 or 4 to each light more seed. Tye up endive for blanc plant out some for seed. Eschalots, g rocambole, should not be deferred pl the roots will be very small. Ground cant should be digged and thrown up i to prepare it ready for sowing. H should now be planted. Hotbeds for c melons, and small fallading, prepare plenty of dung. Sow leeks, and mark seed. Plant out lettuces from under the weather be mild, and sow the 2d cr plenty of air to the forced ones. Sow the beginning of the month for the first when about 3 days old, plant each in a Plant mint in pots on a hotbed. Del room beds from wet. Sow Onions at the month or beginning of the next fo ral crop: weed those sown in autumn, some for seed. Sow parsley for edgings curled, very thin on a bed, to grow lar nishing of dishes, and the large root parsneps on ground digged very deep. of the ground should have the earth d them, as they advance, in dry weathe require sticking. Sow marrowfats and sorts, and the 3d crop of hotspurs. P

ring, for the last crop. Beans for a 3d inders, for the first: Cauliflowers from glasses: Endives for blanching and seed. garlic, and romambole: Horse-radish, rom under glasses: Leeks, onions, and r feed: Potatoes on hotbeds, for the

Uncover radishes in mild weather, and aw on again at night. Sow beets, cab- rots, cauliflowers, coleworts, fennel, uces, mustard, onions, parsley, parf-, radishes, spinach. Sow on hotbeds, s, celery, cress, cucumbers, melons, adish, rape for sallads. Sow Spinach, op, and hoe the winter crop if it be too ater should be carried away, if it stands rains, by cutting trenches.

GARDEN and SHRUBBERY. Anemones culuses should not be deferred planting ld weather, or they will flower weak; ds should be prepared some time before rdy annual flowers, such as sweet peas, candy-tuft, alysson, corn-bottles, per- ad some few others, may be now sown, ill flower very early. Auriculas must d by mats from wet, the decayed leaves pulled off, and fresh earthed. Box for ay be planted in mild weather. Bul- of every kind unplanted should not be e first opportunity which offers of mild and let the beds be thrown up into rid- hand. Bulbous roots in boxes, pots,

require a regular attention to water d the earth should be stirred up once a rnations must be fresh potted, and from heavy rains by mats. Flowering d forest trees of all sorts, except ever- ay be planted at the end of the month. ks, if intended to be made next month, ve the ground prepared by levelling it. or sowing amaranths, balsams, and other uals, should be prepared, and the seed e end of the month. Hyacinths, which ground, should be covered with mats by hoops. Mignonette must be sown ed, or it will do in a pot placed in a n where the sunshine comes; but let the n very thin. Perennial-rooted flowers, d of the month, may be removed from eds, and the old roots transplanted. ones and ranunculuses: Box for edg- : end of the month: Bulbous and tube- of all sorts: Flowering shrubs and or- trees: Forest trees of all sorts, except . Shrubbery should be dugged over l smooth, to destroy the young weeds to shoot; but the trees should first be Shrubs of all sorts should have the ken off, and, if small, be planted in beds nder until they are stronger; and any now be planted. Sow at the end of the dy annuals and mignonette.

GARDEN and ORCHARD. Apple and should be finished pruning the first ther. Plant Cuttings of currants and es. Prepare Grafts of apples and pears. dies, against peaches, nectarines, and in the beginning of the month; they about two feet higher than the walls,

that they may be set sloping; and must be fasten- ed with stakes, and remain there till the fruit is set. Sow Kernels of apples and pears, for stocks. Planting all sorts of fruit trees should be finished early in the month, and the roots covered with mulch. Pruning wail trees should be finished. Straw- berries may be planted at the end of the month, and the old beds dressed; those on hotbeds must be frequently watered. Vines, finish pruning be- fore they bleed. Wall-trees, as apricots, necta- rines, peaches, plums, pears, should be finish- ed pruning in the month, and those done in Octo- ber must be examined, and the dead ends cut off.

GREENHOUSE. Admit air, very freely in mild weather. Earth the top of the pots, but first take out the old an inch deep. Fire must be made in foggy weather to dry the house. Leaves this month decay very fast; therefore they will require picking off almost every day, but especially from the geraniums. Myrtles, oranges, winter cherries, and some others, water frequently, but not too much at a time. Succulent plants, as aloes, ficoi- des, &c. must not have any water given them in this month, for it will cause them to rot. Water the plants which require it frequently, but very sparing- ly; for too much moisture in the house will injure the plants. Windows may be opened for a few hours in the middle of the day, but should be shut again about two o'clock, or whenever it begins to be foggy.

M A R C H.

KITCHEN GARDEN. Alifanders sown in an- tumn, should be hoed to a foot asunder, and more seed sown. Aromatic shrubs and herbs on beds, weed and fresh earth, early in the month; and sow and plant more of all sorts. Dress artichokes, and take the suckers off for a fresh plantation. Asparagus seed must now be sown to raise roots for forcing, and for fresh beds; at the end of a- bout 12 years, destroy the old beds, but take up the roots and force them: By now and then making one new bed, a constant succession may be kept up in full vigour. Plant out that which was sown last year. Fork up the beds, and rake them smooth, but do not leave the alleys above six inches lower than the top of the bed. Water the beds in a morning, in dry weather, early in the month, with the drainings from a dunghill, to forward them. Make fresh plantations in moist weather. Plant beans, for the 4th early crop, and the 2d of Windsors. Cut off the tops of thoe in flower. Finish sowing beets. Sow boorcole of various sorts, for the first crop. Sow broccoli, of the early sort for the first crop. Cabbages, sow the 3d crop of sugarloaf, the 2d of red, and the first of savoy. Sow carrots now for the principal crop. Sow capsicums, for pickling, on a hot- bed. Cauliflowers must be planted out, leaving two only of the strongest to each glass: draw earth up to the stems, and prop up the glasses. Prick out those sown last month, and sow the 3d crop. Prick out the first crop of celery from the seedbed, and sow the 2d. Chardons must be sown, and cives planted. Prick out the first crop of colewort. Cress, mustard, radish, and rape, may now be sown in the open ground for sallading; and cover the seed for a few days with a mat, or place

place hand-glasses over it. Sow cress and mustard, very thin for seed. Cucumber beds must be kept to a good heat, by cutting off some around the sides, and adding fresh hot dung instead of it. Plant out the 2d crop on a fresh bed. About the 20th sow seeds of the turkey, and some for bell-glasses. Prepare hotbeds for planting cucumbers, and melons. Plant Jerusalem artichokes. Sow leeks. Sow kidney beans at the end of the month, on a warm border. Plant out lettuces, from under the glasses. Sow the third crop of cos or other sorts. Plant out melons, from the first hotbed. Sow cantaloupes for the 2d crop, and some on a tan-bed, and for bell-glasses. Mint-beds, weed and earth, and plant more. Mushroom beds, make for summer use. Nasturtiums for pickling, sow at the end of the month. Carefully weed onion beds before the weeds are high; and finish sowing the principal crop. Sow parsley, both curled and large-rooted. Finish sowing parsneps. Earth up peas in dry weather and stick. Sow the 2d crop of marrowfats. Plant artichokes, asparagus, beans, cives, cucumbers, Jerusalem artichokes, lettuces, melons, mushrooms, potatoes, and tarragon. Plant aromatic herbs and shrubs; as balm, camomile, lavender, mint, pennyroyal, rosemary, rue, sage, savory, thyme, &c. Pot and sweet-herbs should now be sown. Slip pot-marjoram, savory, and thyme. Weed potatoes, and plant the principal crop. Sow radishes, the 4th crop, and rampions. Sow alifanders, angelica, asparagus, basil, beets, borage, boorccole, broccoli, burnet, cabbages, capscums, carrots, cauliflowers, celery, celeriac, chardons, chervil, clary, corianders, cress, cucumbers, dill, fennel, hyssop, kidney beans, leeks, lettuces, marjoram, marygolds, melons, mustard, nasturtiums, onions, parsley, parsneps, peas, purslane, radishes, rampions, salsafy, savory, scorzonera, sea-kale, skirrets, sorrel, spinach, tarragon, thyme, tomatoes, turneps, water-cresses. Weed spinach, and sow the 2d crop. Plant tarragon, and sow tomatoes. Turneps, sow the first crop. Sow water-cresses, in a moist place, or where it may be constantly supplied with waste water from the pump. Destroy weeds, while small, which will save future trouble.

FLOWER GARDEN and SHRUBBERY. Anemones and ranunculuses, if any remain unplanted, must not be deferred longer than the first mild day. Anemones in flower should be covered with mats in windy or rainy weather. Annual flowers which are tender, (See Catalogue, SECT. VII.) if sown early in the month, will require a 2d hotbed to be transplanted into; and if not sown, should not be deferred any longer, to have them early and strong. Sow those also mentioned in § II. of the general Catalogue, on a moderate hotbed. Annual flowers of all the hardy sorts in the Catalogue may be sown about the middle of the month in small patches where they are to remain; hollow the earth out in the form of a basin, fifteen inches over, and an inch deep, and sow the seeds very thin all over it, and not a small patch in the middle, as is too frequently the custom. Auriculas should be removed into the stand, and if some flat oyster-shells be laid on the earth, they will keep moist, and save trouble in watering them. Borders

of the flower-garden will require over or weeded, to destroy weeds which are beginning to shoot, and then raked, that they may be neat. Box for edgings, in mild weather, should be covered with mats, and the roots in beds should be covered in rainy or stormy weather, and the plants gently up with one's fingers to destroy those also in the house must be attended to. Carnations, if not potted, should be done the beginning of this. Shrubs, and trees of all sorts, may be planted in mild weather; then cover the roots with moss, fern, or some such things, to keep the ground moist, which is better, and gives less trouble in watering. Plant flowering shrubs and forest trees, early in the month, and cover them with mats. Grass walks must be swept and rolled, and will need turning and rolling, and weeding, and cleaned from moss with a broom. Hyacinths must be covered with mats, to prevent their flowers from being cut, but not kept too close. Larkspurs, or patches, must be thinned and not more than 8 or 10 inches. Mignonette, sown the first of the month, should be transplanted, and sown. Myrtles, winter cherries, and greenhouse plants, planted against the wall, have the mats rolled up in fine weather, and the dust washed off from their leaves, and again at night. Perennial and biennial flowers must be sown on beds, very thin, that they may be strong; those sown last year should be transplanted, and the old roots of the perennials edged. Plant annuals from the first hotbed, and perennials from the seedbed. Edgings: Evergreens of all sorts: Perennials, dividing their roots, and seedlings, and sowing: Shrubs and trees early in the month. Strawberries and thrift for edging. Strawberries should be pruned early in the month, and the runners taken off, and planted a foot at least apart, and the rows two feet apart: the ground should be dug, and then raked over, that it may be neat and clean. Sow tender annuals from the hotbed: Annuals that are hardy in the ground: Biennials and perennials on beds, and trees of almost every sort. Strawberries for an edging to the shrubbery, at six feet apart; the flowers make a pleasing appearance, and afterwards you will have very large fruit, being in a single row. Plant strawberries against a south wall, which will produce flowers, and ripen the fruit. Constant weeding by hoeing while small, with a small hoe made to cut both ways, by which it may always keep your shrubbery in a very little trouble.

FRUIT GARDEN and ORCHARD. Apple trees, and peach trees, should have hurdles placed before them, to defend the blossoms; or else stick branches of yew, or other such, amongst them, but hurdles are the best. Those which have mats nailed over them, should have them taken away by degrees, by first taking them at the bottom, towards the end of the month. Graft trees, and cut down the buds. Place hurdles, before the wall trees.

ought to be finished pruning at the the month, if omitted till then; the late lately planted should be cut off. pruning trees of all sorts should be the beginning of the month. Straw- could now be attended to; hoe them y the weeds, and stir up the earth ; then spread some very rotten dung ver them. Those on hotbeds want ering, and the dead leaves should be cked off, to let the sun come to the plantations may now be made. Vines layered; draw some strong bearing ough the bottom of the pot, and ot into the ground; and then they planted the next season, and produce year; plant cuttings. Finish prun- , and mulch those lately planted.

USE. Give air freely in the middle xcept the wind be very cold. Earth the pots, but take the old earth out

Place geraniums near the windows air being drawn up weak. Myrtles, es, and other hardy plants, will want , and, if the weather be mild, may t to make more room, but let them l place at first. Orange trees, if their edered, will want watering with a a warm water. Those with ill shaped be cut down, and placed on a strong e ketters in pots, good strong seed, e let an inch asunder, they will grow alant plants may now have a little of much at a time. Water the plants e of the day, and only when the sun the water should be set in the house e days to take off the chafers, and er. Windows may be opened for a the middle of all fine days.

A P R I L.

GARDEN. April being the latest time e principal crops of the kitchen gar- tring directed to be performed but omitted, or the weather would not t be done early in this. Aromatic ubs of all the following sorts should tely, as balm, camomile, pennyroyal, pearwort, tansy, lavender, rose- ce, southernwood, wormwood, &c. sowing and planting asparagus early in

Let the beds be forked and raked watered twice a week with drainings . Cut off every bud, however small; e left on, they weaken the others; s in general only practised by the a gardeners. Never suffer any weeds er they are an inch high, for they sprout very much. Beans in flower heir tops cut off; and draw the stalks rop close to the wall by strings, and up. Plant the third crop of Wallflowers. scabb should have the first crop prick- the 2d sown. Cabbages of the early have their leaves tied up to forward ing. Prick out from the seedbed the 1st leaf, the 2d of red, and the first Prick out *capitata*, from the seed- ART. I.

bed, to prevent their growing weak, upon another hotbed. Weed carrots, thin the first crop, and sow the 2d to draw young. Search for caterpillars upon cabbages and apple-trees particularly. Cauli- flowers should have the earth drawn up very high to raise the glassies, and a piece of brick put under each corner, and at the end of the month taken quite away. Break down the leaves when the flowers of any begin to appear; earth the 2d crop and prick out the third. Celery, prick out the 2d crop, and sow the third. Sow cress and mu- tard, every weak. Cucumber beds must be at- tended to, and plenty of air given them, when mild; and, if the heat declines, fresh dung must be added to the sides. Make a gentle hotbed within the ground for those that are to be under bell or hand glassies, and plant them on it at the end of the month. Sow more seed, that you may have plenty of plants. Endive planted out for seed should be earthed up, and the first crop sown. Sow fennel, in drills a foot asunder, for the first crop. Hotbeds for sowing of melons for bell glassies must be prepared, and loam and rotten dung pro- cured, to be ready. Sow kidney beans, the 2d crop, and the first of the scarlet flowering. Tie up lettuces, to assist their cabbaging; those in beds should be thinned to a foot distance; others plant- ed out, and the 4th crop sown very thin in an airy place. Melon beds will require to be kept up to a good heat, and the 2d and 3d crop planted out. Finish making mushroom beds, early in the month, which will last till September. Onion beds must be attended to, to keep clear from weeds as soon as any appear, and sow the second crop to draw young. Thin Parsley for garnishing dishes, and leave those plants which have the best curled leaves. Sow the large-rooted. Earth up peas frequently, and stick them as soon as any tendrils appear. Sow the 3d crop of marrowfat. Plant beans, and mushrooms. Plant cucumbers and melons on fresh hotbeds. Potatoes should now be finished planting. Pot and sweet herbs may still be sown and planted; and weed and earth the beds. Sow purslane, on a warm border in rich earth. Sow radishes, for a 5th crop in a cool place. Ship and plant out last year's rosemary, rue, sage, savory, and thyme. Search often for flies and thrips. Sow aromatic herbs and shrubs; mu- tard, peas, purslane, and dracillas. Sow cress, in a cool place. Turnips, hoe the first crop and sow cucumbers and melons. Sow spinach, the 2d crop, the 2d. Weed all the beds of seedling, while the weeds are small, and any other crops sown.

FLOWER-GARDEN AND SHALLOTT. Anemones in stormy weather will still require covering with mats. Annual flowers on hotbeds will require thinning, and some of the strongest must be plant- ed in single pots. Hardy annuals, if not already sown as directed in March, should be deferred no longer, and sown very thin. Anemones in bloom must be constantly attended to, and defended from violent winds, but yet have plenty of air in mild weather; the seedbeds will want frequent and gentle waterings. Balm or galead may be sown or slipped, but the strongest plants will be raised from seed. Biennial and perennial flowers, fi- nish sowing early in the month. Weeds or weeds the borders of the nursery and flower-garden.

ches distant, to be ready for transplanting. Sow the 6th crop of lettuces in a row, and thin those for seed to a foot distance. Sow melons in frames with mats in the day, and lay pieces of broken earth or dishes under the fruit. Plant out the oiled papers. Examine often the onion beds, that they do not want water. Thin the onion beds to 6 or 8 inches distant. Thin the beds for garnish, and the large rooted to the soil. Parsneps must be thinned to 10 inches. Sow the last marrowfat pease in a row. Plant lettuces and melons. Weed and sweet herbs often, and gather for use before they begin to flower; then tie in small bunches, and hang them across a shady room to dry. Prick out broccoli, cauliflowers, and celery. Sow turneps for radishes. Sow radishes, the 7th crop, and cress, and black Spanish, in a cool place. Coleseed may now be sown. Seeds of all sorts should be gathered as they ripen, and defended from vermin. Sow spinach, the 5th crop, thin in a cool place. Thin the following crops, and leave them at proper distances, as, beets, at 10 or 12 inches at first, at 8 or 10 inches. Leeks may be left in the ground, and transplanted in July. Lettuces for seed, at least a foot asunder; but 15 inches will be better. Onions, at 6 or 8 inches. Parsneps, at 10 inches. Turneps at 6 or 8 inches. Sow a row of turneps, and hoe the others. Water the seedlings and cuttings frequently. The young crops is of the utmost consequence this month, especially if it be a rainy season. Must not on any account be omitted; nor weeds run to seed.

FRUIT GARDEN and SHRUBBERY. Take down the fruit before their leaves are quite withered, they will be more readily found. Annuals in the hotbeds will require fresh potting, and be placed in the open air if it be settled weather, but will want frequent watering. Annuals on the borders should have the earth stirred with a hoe, and be often watered, and more so in autumn, as described under last month. Biennials and perennials, transplant from the seedbeds. Hoe and rake borders of the flower garden and shrubbery frequently. Box may be cut, but always do it in moist weather. Budded flowers of every sort, whose leaves are withered, should be taken up before they are entirely disappear, and put into shallow boxes, as directed for hyacinths, as they dry. Carnations require to be examined often, and tied up to the sticks. Search for insects. Evergreens may be clipped in moist weather.

Grass and gravel walks will often require watering, but it should be done after rain, so that the roots may be drawn out without injury: they will often want mowing and rolling.

Hyacinths, as soon as dried, should be taken up of the ground, then rubbed with a woolen cloth to clear them entirely from earth, and allow them to dry in wooden drawers; but they should be put into flower-pots, earthen pans, or brick floors, for they will contract a mildewiness, which will make them rot.

Insects of all sorts should be sought for and destroyed. Kidney beans will want earthing, sticking, and the runners to be trained to the sticks. Mignonette, from the seedbeds, should be transplanted into small pots, and only 3 put into each; it will then be ready to put into larger pots, or upon the borders. Myrtles, and other greenhouse plants against walls, should be often watered, all fore-right shoots pulled off while small, and the others nailed to the walls with long narrow shreds of fine cloth. Plant out perennials and biennials from the seedbeds in showery weather; and, if the sun should be very hot soon after, cover each plant with a flower-pot, until they have taken root. Pinks may now be increased by making pipings or cuttings, but a glass must be placed over them. Plant out all annuals from the seedbeds and hotbeds: biennials and perennials from the seedbeds: mignonette both in pots and on borders: pipings of carnations and pinks. Attend to ranunculuses, and take them up as soon as the leaves are quite withered. Rose trees may now be layered and budded, and some very rotten dung spread on the ground, and digged in, and often watered; the flies and grubs must also be attended to. Seedlings of trees, shrubs, or flowers, should be covered with mats in the daytime, and often watered; but, if in pots, remove them into the shade. Seeds of all sorts which are ripening should be attended to, and gathered before they drop out of the pods. By a little attention to them, in most seasons, enough may be got for the next year, and the expence of buying saved. Shrubberies ought frequently to be looked over; all straggling branches should be cut off or tied up; and the grounds stirred with a Dutch hoe. Shrubs in pots may be set in pans, and watered often. Sow annuals, as described under last month, to flower in autumn, in any vacancies that may be on the borders of the shrubbery or flower garden. Tulips should be taken up before their leaves are quite decayed, that they may be found more readily; and if any of the offsets be very small, plant them again directly, and lay the roots to dry in shallow boxes. Tulips produce new bulbs every year, and the old ones decay entirely; therefore they should never be taken up until the new bulbs are quite formed. Water annuals in pots constantly; seedbeds of all sorts; and shrubs and trees lately planted. Weeds, in this month, it is of the utmost consequence to destroy before they flower. When cut down they should be raked up and carried away, for many sorts will otherwise ripen their seeds lying on the ground.

FRUIT GARDEN and ORCHARD. Apple trees in espaliers must be often examined; all fore-right shoots should be taken off while small, and the others regularly trained to their proper distances. Search for caterpillars. If the standard apple trees be infected with caterpillars, light some damp straw, and with a fork direct the smoke through the tree, and they will soon be suffocated, and instantly drop down. Apricots must be thinned for the 3d and last time, and the shoots frequently nailed up. Blighted trees must be constantly attended to, as directed last month. Bud apricots, cherries, and peach trees. Search for caterpillars upon

upon apple trees. Cherry trees against walls should be covered with nets, to defend the fruit from birds. Look over the espalier trees often, and train the shoots in regular order. Nail up fig trees with very strong shreds. Nail up every week shoots of wall trees. Nectarines and peaches will require thinning the 2d time, nailing up the shoots and pinching off the ends where vacancies want filling up. Nail up pears and plums as they shoot, and pull off all fore-right shoots. Keep stocks, intended to be budded, free from weeds. Strawberries in flower will need frequent watering in dry weather. Lay tiles or wheat straw under the fruit of the scarlets, and pull off all decayed leaves; this will keep the fruit clean, and cause it to ripen sooner by several days. Cut off all runners as fast as they shoot. To make some fresh beds, reserve the first runners, as they are the strongest. Attend to the flowering of the hautboys, as directed under last month. Vines require constant attendance, in rubbing off improper buds, and nailing up the shoots. Water those trees frequently which are blighted: all newly planted trees in dry weather; and strawberries in flower.

GREENHOUSE. Air may now be given very freely in the greenhouse, and the windows may be kept open all night. Fresh earth aloes, and place near the windows, but take out the Americans. Plant cuttings of various sorts, under bell or hand glasses, at the end of the month. Earth all the plants every month at top, if not shifted. It makes them look neater, and grow better. Geranium seedlings sown in March will now require pricking out, and cuttings planted under glasses. March jessamines, lemons, and oranges. Layer jessamines, oleanders, &c. Plant myrtle cuttings at the end of the month under glass, but never take them off till they have grown two inches. Orange trees, if not taken out at the end of last month, will require it at the beginning of this. Clean well the leaves which are mowed, or have insects on them, with a sponge and warm water. Inarching may now be performed. Those on hot-beds, and the young seedlings, must be attended to, and the stems of the old trees should be frequently washed. Often water seedling plants of all sorts; shade them in the middle of the day, and prick out the strongest to make room for others. Succulent plants may now be shifted, the offsets taken off, placed near the windows, and be often watered. Watering some of the plants will be necessary almost every day.

JULY.

KITCHEN GARDEN. Aromatic herbs, flowers, and shrubs, gathered last month, if hung on lines will soon be dried. It is then better to strip off the leaves and flowers from the stalks, and put them into paper bags, which will preserve their flavour better, and keep them free from dust. Continuing to gather them before their flowers are too much opened. Asparagus if wished for in autumn, must be attended to at the beginning of this month; the stalks must be cut down, and, if it be dry weather, the beds must be very well watered with the draining from a dunghill. Next day fork them up lightly, and rake them smooth; if the weather continues dry, water them every night

for a week, and in about 8 or 10 days they will be fit to cut. If this be done every year, leave or 3 beds uncultivated at spring, and make some more beds to allow for this double crop. Beans, plant the 5th crop of mazagan, and the 4th of Windsor, late crops. Finish thinning of beets to their proper distance. Plant the 2d crop of kale, prick out the 3d, and the first of Arjou. Plant out the 3d crop of broccoli, and prick out the 4th. Plant the 4th crop of cabbages, and prick out the 5th. Prick out the 3d crop of red cabbages. Plant the 2d crop of Savoys, and prick out the 3d. Plant bage turneps, &c. for cattle, prick out the 4th crop. Sow carrots to draw young, the 3d crop. Earth up and often water capsicums. Plant the 4th crop of cauliflowers. Plant the 2d of celeriac, and prick out the 5th. Finish sowing coleworts, and rape. Prick out the 2d crop of coleworts. Stick cucumbers on the open ground with branches of elm or other sticks. Lay tiles over endive, or tie up the first crop; plant the 2d, prick out the 3d, and sow the 4th very thin. Take up shallots and garlic for present use. Sow fennel the 4th crop. Sow kidney beans, on a south wall, the 5th and last crop. Still plant lavender and rosemary cuttings. Plant out leeks in double rows, at six inches distance, and a foot between the rows. Sow the 7th crop of lettuces in a cool place; and hoe those intended for seed. Must be frequently attended to. Water the rooms in dry weather. Pull onions, when the leaves begin to wither, out of the ground. Sow the first crop of Welsh onions, and the last crop to draw young. Sow the 3d crop of parsley, against a south wall. Peas sown last month will be sticking. Sow the 4th crop of hotspurs. Plant red cabbages, rosemary, and Savoys. Gather herbs and sweet herbs for drying; and, as soon as dried, strip off the leaves, and put them into paper bags. Prick out broccoli, cabbages, coleworts, and boarcole. Sow radishes, the 1st crop; also turnep-rooted, and black Spanish; hoe the first. Seeds of all sorts must be attended to, and gathered as they ripen. Sow rape and turnep-radishes. Sow spinach the 6th crop, and the first of prickly, in a cool place, very thin. Sow turneps, the 5th and principal crop for winter use, and hoe the other crops. Water the beds of seedlings, and all young crops. Weeds must be constantly attended to, and raked off the ground, or else many sorts will ripen as they are on the ground.

FLOWER GARDEN AND SHRUBBERY. Annuals in pots require a constant attention, lest they should want water; and those on the borders require sticking and tying. Seeds nearly ripe must be watched and gathered, else many sorts will be lost. Annuals, to flower late in autumn, may still be sown. Auriculas and polyanthus from the seed bed should be transplanted upon a shady border, and, if possible, in rainy weather. Finish cutting of box and evergreen shrubs. Bud the curious sorts of jessamines, roses, &c. Bulbous roots must still be attended to, to take up dry and clean, and then put in shallow wooden boxes. Saffron crocus, and many other sorts, which flower in autumn, may now be planted. Carnations must be constantly watered, earwigs gathered for, and laid

pipings made. Evergreens, if required, now be transplanted, but it should be in dry weather; and let the clipping be finished and gravel walks must be frequently mowed, and rolled. Hyacinths should be taken up to see that there is no moulding on them; and if any be decayed, they should be thrown away. Kidney beans must be examined, they are trained to the sticks, and watered as they are trained. Lilies of many sorts, if they have begun to flower, may be taken up; but the roots should be of moderate size, that the small offsets must be taken up and planted again directly. Mignonette should be taken up to flower in winter, and more put in.

Myrtles, and other greenhouse plants, will require frequent nailing and watering.

Finish planting perennials and biennial seed beds. Pinks, finish making pipe cuttings. Plant auricula and polyanthus; biennial and perennial seedlings: cuttings of carnations and pinks: evergreens, if they are rainy: mignonette into pots: offsets: offsets of autumnal flowering bulbs: offsets of carnations and pinks: saffron-crocuses must be taken up, and laid in the dry; then well cleaned from earth, and put in boxes, or put into paper boxes. Finishing and budding of rose trees. Seedling trees, and flowers, must be properly watered. Seeds now begin to ripen very early must be constantly attended to, and sown. Shrubberies will require frequent watering in pruning or hoeing. Sow the last crop of annuals and mignonette. Tulips should be taken up, and as soon as dry, the earth should be rubbed off, and then laid in shallow boxes. Water annuals in pots often, seedbeds, and trees, and shrubs planted this spring. If it be rainy this month, grow very fast; the ground should be frequently hoed, and seeds sown to run to seed.

GARDEN and ORCHARD. Destroy ants, and wasps, as soon as they appear, by hanging half filled with sugar, or honey and vinegar. Often look over apricot trees; pull off the light shoots, and nail those which are to remain. Attend to blighted trees, and water them often. Budding of apricots, cherries, and finish. Currants intended to be preserved for autumn, should now be covered with straw. Often examine espalier trees, and train in them. Fig trees require nailing up as they grow, with strong nails and long threads. Fruit should be gathered in the morning, as soon as the dew has dried from it, and before it is hot, and then laid in a cool room. The fruit should now be prepared; it should be situated in a cool place, the shelves neat and clean, the fruit covered with tiles, or else white washed or painted white. Destroy insects of all sorts. Nail up the shoots of wall trees. Thin nectarines for the 3d and last time, and nail up the shoots. Water strawberries in flower in dry weather, and pull off decayed fruit. Tie up the fruit of the hantboys and other sorts to sticks. Cut off all runners as they come, and these should be planted out as soon as rain falls. Vines must be very often

attended to, to nail up the shoots, and pull off all improper buds. Wall trees require constant attention, to nail up and water in very dry weather. Water the blighted and new planted trees; strawberries in flower, or runners lately planted.

GREENHOUSE. African aloes, and other succulent green-house plants, may now be set out in the open air. Cuttings of asters, geraniums, grewias, myrtles, &c. should now be planted under bell or hand glasses, which should not be taken off until they have grown an inch. Earth the tops of all the pots, first taking a little out. Plant geranium cuttings, and prick out the seedlings before they are too thick. Those with variegated leaves do best in alcoves or under a little shelter. Paint and white-wash the greenhouse. Inarching and layering various sorts may still be performed. Plant myrtle cuttings under glasses, and water frequently near the glass, without taking them off. The small ones may be planted in beds. Orange trees must be examined: if there be insects under the leaves, wash them off. Shade and water those on hotbeds often. Plant stocks when four inches high, in separate pots. Pans should be placed under all the pots, as it is better for the plants, and saves much trouble in watering. Shade, water, and prick out seedling plants. Succulent plants, as a oes, cereuses, ficoides, and Indian figs, torch-thistles, &c. may now be set abroad. Watering the plants must be attended to every day.

AUGUST.

KITCHEN GARDEN. Sow alifanders, angelica, and chervil. Asparagus cut down last month will require constant watering. Beans planted last month will also want watering. Broccoli, cabbages, cauliflowers, and colewort, lately planted, will require hoeing around them, and earth must be drawn up to their stems. Plant out the 3d crop of broccoli. Cabbages, for the first crop at spring, should be sown about the 10th or 12th day of the month. Prick out the 2d crop of cabbage turneps. Weed carrots sown last month as soon as they appear. Sow cauliflowers, for the first spring crop, about the 20th in rich earth, but shade them in the middle of the day by mats. Earth the first crop of celery for blanching, and plant out the third. Plant out some of the 2d crop of coleworts. Sow corn salad on beds. Cucumbers for pickling, either large or small, to have them fine, should now be gathered; and they will be free from spots, and save much trouble in greening. Train them regularly into the sticks. Often tie up endive for blanching; plant out the 3d crop, and thin the 4th. Take up chalcots, garlic, and rorambois, if the stalks be quite withered: clean them from earth, and keep them in a dry place. Kidney beans, sown for the last crop, must be watered in dry weather. Finish planting out beets. Lettuces, for standing through the winter, and for forcing, must now be sown very thin at 3 different times in the month: and plant out those last sown, on a south border. Melons, in rainy weather, must be defended from wet by putting hand glasses over them; and sticks placed for the pickling melons to run up. Prepare mushroom beds, by having dung and spawn ready for the next month. Onions must be frequently

quently turned, that they may be well dried. Sow the 2d crop of Welsh onions. Gather pepper-mint for distilling, as soon as it begins to flower. Sow some hotspur peas, on a south border for the 5th and last-crop. Plant celery, endive, leeks, and lettuce. Prick out Anjou, Brussels booreole, cabbage-turneps, and turnep-rooted cabbages. Sow radishes, the 9th and last crop. Seeds, nearly ripe must be guarded from birds, particularly radish seeds. Sow cress, fennel, mustard, and sorrel. Sow the 2d crop of prickly broadcast spinach, and then, at spring, hoe it into beds 4 feet wide, with paths of 18 inches between the beds. Hoe, and sow the 6th crop of turneps. Water seedling beds in the morning. Weeds grow very fast in moist weather, and therefore must be hoed frequently, raked together and carried away.

FLOWER GARDEN and SHRUBBERY. Annuals in pots will want frequent watering. Those on borders sticking and tying, and the seeds gathering of those nearly ripe. Anemone and auricula seeds are sown this month by many, but they do better in Jan. or Feb. Slip and fresh-pot the auriculas. Balsams, in pots, intended to raise seed from, must be removed into shelter. Plant bulbous roots, that flower in autumn, early in the month. Bulbous roots of all sorts should have their offsets planted at the end of the month. Take off carnations layers, and plant out the pipings from under the glasses. Finish clipping of evergreen trees and shrubs. Grass walks and lawns require frequent mowing. Gravel walks must be weeded and rolled. Take up lilies, if their leaves be decayed; but the offsets must be planted again directly. Plant mignonette in pots to flower in winter, and place them under a south wall. Myrtles and greenhouse plants against walls must be pruned and nailed, and constantly watered. Plant out the pipings of pinks if they have struck roots. Plant Guernsey lilies in pots. Attend to seeds of all sorts of flowers and shrubs, and gather them as they ripen. Remove seedlings in pots, to places where they will have the morning sun. Shrubberies will want frequent hoeing to keep down the weeds. Strawberry runners will require to be constantly taken off as they shoot out, to keep the borders and walks neat. Water plants in the morning, at the end of the month. Weeds must be frequently destroyed to prevent their running to seed.

FRUIT GARDEN and ORCHARD. Destroy ants, flies, and wasps, by supplying fresh bottles of sugar, or honey and water. Apple trees on espaliers will require frequent examining. Budding of all trees, finish, and pull off buds and shoots from the stocks. Currants intended to be preserved, finish covering with mats. Examine espalier trees, constantly to train in the shoots. Nail up fig trees, with strong nails. Gather fruit early in the morning, and lay it in a cool room. Finish the fruit room, by white washing or painting, and putting the shelves in order. Destroy insects of all sorts. Nail up every week the fruit trees. Nail up nectarines and peaches frequently. Attend to pear and plum trees, both on walls and against espaliers, constantly. Transplant strawberry runners if rooted, in rainy weather, and *cut off all the others* as they shoot. Vines must

be constantly nailed up, as they shoot and the bunches of grapes begin to be all weak shoots must be constantly Water strawberry runners lately planted blighted fruit trees.

GREENHOUSE. Take off the offsets both African and American, and plant in separate pots. Often water the cuttings of raniums, &c. Earth the tops of a Water geraniums and myrtles, and pour on the water gently. Oranges, the middle of the month. Prune an quire it, as this is the season of the Water the young stocks and those Finish the painting and white-washing of house. Finish pricking out seedling water and shade them. Shift the p require it into large pots, and earth Succulent plants should be shifted, and of the month be rainy, take them in. freely, if the weather be dry, but in morning.

SEPTEMBER.

KITCHEN GARDEN. Aromatic herb should have their decayed stalks cut and strengthen them; and transplant them. ed in July must be earthed up, and the ed off as soon as they begin to flower. the third crop of kale and the first of the other crops and earth them up. part of the 4th crop of broccoli, and other crops. Plant out the 5th crop prick out the first crop, on a south earth up any that want it. Plant out of favoys and red cabbages; and the cabbage-turneps. Hoe carrots sown in leave them at six inches distance. Cauliflower last month must be pricked out, watered until they are rooted. Earth up them and break down the leaves if they begin Plant out the 4th crop of celery, and first and 2d to blanch. Chardons will blanching. Plant out more of the coleworts, a few at a time, to thin the cress and mustard, every week, and at the month under glasses. Cucumbers should be finished gathering; which the advantage of sticking them, and pick Plant out a little of the 4th crop of endive it, and give the rest more room. to blanch. Eichelots, garlic, and should have the offsets and small roots Lettuces must be thinned early in the sown thick, and pricked out on a south about 4 or 5 inches asunder. Melons will now be fit to gather. Make must at the beginning of the month. Gather for pickling. Finish sowing onions, in month, the 2d crop of Welsh. Weeds last month before the weeds are in water-cresses. Prick out cabbages, and lettuces. Gather seeds constantly as Sow cress, mustard, turneps, and water Finish sowing spinach for spring use, in sown last month. Plant tarragon roots thin turneps, turnep-radishes, and bl radishes. Water in dry weather any

l. Weeds must be particularly attended to the onions, carrots, and lettuces, are small.

GARDEN and SHRUBBERY. Plant single flowered, at the end of the flower early. Annuals in pots must be watered to ripen the seeds. Remove that they may have the morning sun, slipping them. Balsams, cockscombs, or other curious annuals in pots, which to raise seeds from, must be placed in an alcove, greenhouse, or room to the south, and then the seeds will ripen. Plant box for edgings, at the beginning of the month, or as soon as any rain falls. Plant roots of all sorts, early in the month; sets and lilies, and crown-imperials first. Greens, at the end of the month, if it be moist. Grass walks may now be made or new ones made. Weed and roll paths often. Plant hyacinths, jonquils, anemones, polyanthus narcissus, &c. at the end of the month. Plant laurel cuttings, in

Layer laurustinus and other shrubs. Lilies which flower late, as soon as their buds are decayed, but plant the offsets again and all other sorts of lilies. Place Mignonette in pots, under shelter. Myrtles and other plants against walls must be constantly watered in dry weather. Plant out perennial feeders, divide the old roots. Plant box for evergreens; crown-imperials and lilies in the month; cuttings of laurel, honeysuckles, shrubs and trees of all sorts; and after there has been some rain. Straw-thrift for edgings. Gather seeds, in the evening of the day. Weed and earth seedling beds, hoe, and rake, shrubberies. Sow peas, as cornbottles, larkspurs, pansies, poppies, sweet peas, &c. to flower in spring. Constantly take off strawberry and replace any of the edgings which have run up entirely the old plants; then take up the earth, and bring in fresh loam. Plant bulbs, and all sorts of bulbous roots, the first of the month. Lay down turf for grass walks. Hoe and rake weeds off the ground; after the seeds will ripen, and in wet weather the roots will strike again.

GARDEN and ORCHARD. Destroy ants, and insects of all sorts constantly. Sow seeds on beds. Plant currant and gooseberry cuttings and trees. Nail up fig-trees fresh strong shreds. Attend to the fruit and pick out the rotten pears, or any which begin to decay. Put grapes in scrape, gauze, or paper. Plant currants, raspberries, strawberries. Strawberries planted early in the month, and then they will be rooted before the frost begins. Daisies and plant some strong roots in pots to winter in, and they will bear fruit till January. Dressing, in cold wet weather, of foot-paths, is proper to be spread on the borders of the garden. Vines will require frequent nailing;

PAR. I.

take off all the weak shoots, that the grapes may not be too much shaded.

GREENHOUSE. Remove aloe into the greenhouse in the beginning of the month, but leave out the American ones till the end. Plant cuttings and seedlings, in separate pots, and earth the tops of all the pots. Set in geraniums with variegated leaves, early in the month, and leave off watering the leaves. Take myrtles out of the ground and pot them. Fresh earth orange trees, thin the fruit, or most of it will fall off, and take them into the house at the end of the month. Take in succulent plants of all sorts, early in the month, and give them very little water. Take in aloe, variegated geraniums, and succulent plants, at the beginning of the month; orange trees and tender plants at the end; but myrtles and hardy plants may remain out till the beginning of the next month, unless there is an appearance of frosty nights. Water in the morning, and keep the windows open all night; leave off watering the geraniums over the leaves.

O C T O B E R.

KITCHEN GARDEN. As October is the only time to crop a kitchen garden before winter, omit not any thing ordered now, till next month, and if it can be done at the beginning, instead of the end of the month, it will be much better, lest the rains should come on. Weed aromatic herbs and shrubs in beds, and spread some earth over them. Cut down asparagus stalks, hoe the weeds, and spread earth from the paths on them, but first a little rotten dung. Prepare hotbeds, for forcing, and plant three-year old plants for the first crop. Beans, the early mazagan, must be planted on a south border, for the first crop. Plant out anjou boorcole, the second crop, early in the month, and hoe the ground around the others. Plant out broccoli, the rest of the 4th crop. Plant out half the cabbages, sown in August, of the early sorts, in a warm situation. Plant cabbage-turneps, early in the month, and earth up the others. Finish hoeing carrots, sown in July. Attend to cress-flowers, beginning to flower, by breaking down the leaves. Those intended for glasses will want planting out; let there be six to each glass, and the rest in a frame, or under a south wall. Plant out celery, the 5th and last crop, and earth up the 2d to blanch. Finish planting coleworts. Sow cress, mustard, and radish, under glasses, and on a hotbed at the end of the month. Tie up endive, to blanch, or lay tiles on it, and plant more. Plant eschalots, garlic, and rocambole. Throw up vacant ground into ridges. Hoe boorcole, broccoli, cabbages, and cabbage-turneps; and draw up earth to their stems. Hoe carrots and turneps. Prepare hotbeds, for forcing asparagus and lettuces. Plant out lettuces, cabbage and brown Dutch, on asparagus beds, some under glasses, and others on hotbeds for forcing. Finish gathering melons for pickling. Plant mint, in pots, on a hotbed. Cover mushroom beds well with straw and mats, to defend them from rain. Onions will require to be very well weeded, and should be examined 2 or 3 times in the month. Sow peas, the early hotspurs, on a south border near the wall, for a

first crop. Plant on hotbeds asparagus for the first crop, and lettuces and mints. Plant out, to stand for seed, beet, cabbage, carrots, parsnips, parsnips, turneps. Weed pot herbs and sweet herbs in beds; dig up the earth, and spread some over them. Seeds of all sorts should be threshed out, dried, and put into bags. Sow cress and mustard on hotbeds: Peas on a south border. Hoe spinach for the last time before winter. Destroy weeds in every part of the garden.

FLOWER GARDEN and SHRUBBERY. Any thing ordered last month, if omitted, should early in this, as the beginning of this month is the proper time when the flower garden and shrubbery should be put into order before the winter. Finish planting anemones, to flower early, the first week in the month. Remove zinnias and carnations, into shelter, and in wet weather cover them with mats. Balsams, cockscombs, egg plants, &c. intended to raise seed from, must be constantly attended to, to hasten the ripening of the seed. Turn over beds and composts for bulbous roots, frequently. Finish planting box for edgings, early in the month. Plant bulbous roots for edgings, in pots or boxes, and finish planting pot plants before the rain sets in. Plant a row of aconites, snowdrops, and any bulbous roots which it were early not sowing, at the beginning of the month. Plant evergreens of all sorts, early in the month. Finish laying grass walks, and repair any of the cold places. Weed gravel walks, and rake them in dry weather. Plant by this time, jonquils, lilies, narcissus, and polyanthus in redoubts, early in the month. Finish layering of shrubs. Take off suckers and layers; and, if small, plant them in beds two feet asunder, to be ready against the next season. Finish planting tulips, early in the month, and all sorts of bulbous roots. Finish laying turf early in the month. Hoe and rake off weeds, or they will root again. If possible leave nothing ordered this month unfinished, on account of the uncertainty of the weather in the succeeding month.

FRUIT GARDEN and ORCHARD. Gather apples and pears in the middle of fine dry days. Plant apple trees at the end of the month. Plant currants, gooseberries, and raspberries. Examine grapes in bays, to see that they are not mouldy or decayed. Gather nectarines and peaches, in the middle of the day. Orchards or fruit trees intended to be planted, should have the ground prepared, and the holes dug some weeks before the time; if the soil be very good, some loam and rotten dung should be mixed together, and

the trees planted in it. If the soil be poor, bring a cart load of earth at least 1 foot from the earth into a little hill, above and put the tree upon it, but first a foot deep in a circle of 4 feet. Gather peaches in the middle of the month, lay them in the sun for a week, they are much improved gently like a pie, and eating, the best wine. Plant peach trees, at 1 month. Plant fruit trees of all sorts, four or five trees, but sweep off all with a black brown. Finish dressing beds, and water the asparagus frequently. Vines in pots should be made the holes ready, pour water in this, gently turn them out of the pot in the hole and break it, and it cannot be disturbed, and you will next year. Finish pruning and planting early in the month.

GARTEN. Give air very day time, at the very close of the winter night until the end of the month. If of the pots. Take in geraniums monthly, if not done the last; water by, or they will begin to shoot small and become a decayed leaves. Open the best plants, or set in order, the decayed. Take in myrtles two the month. Open the trees found in the month; even the leaves there in for insects, which fasten underneath, and pick them off; if milkweed, wash them with warm urine. Water succulent plants sparingly, myrtles, orange trees, winter chesnut, woody plants often. Open the winter fine day, but keep them shut in fog.

NOVEMBER.

KITCHEN GARDEN. Any thing month, if omitted, may be finished before the rain prevents. Cut do stalks, and earth them up. Asparagus beds must have air given to it; a plant the 2d bed; cut down the straw dressing the beds. Finish planting first crop. Plant beets, cabbages, a feed. Take up carrots and lay them in frames, in the middle of fine days. Sery when dry, to blanch. Sow cress and radishes on hotbeds. Take up plant edout, and plant on the south side raised up two feet high. Throw up vines into ridges. Prepare hotbeds for fungus and lettuces. Attend to lettuce and give them air in the middle of the mushroom beds from wet. Take and large rooted parsley. Draw ear and beans above ground, and place in nice. Plant asparagus on a hotbed crop: endive on the south side of beets, cabbages, and carrots, for potatoes, sort them, pick out the best and reserve the best for use in winter. Short topped radishes about the 20th

beaten straw over the beds. Dig up fillets, and scorzoneras. Sow cress, mustard, and radishes on hotbeds for small saladings. Sowing again, if it be too thick. Drain off water; weed all the crops; and take care to prevent their rooting again.

FRUIT GARDEN and SHRUBBERY. November generally a very rainy month, if any sowing to be omitted last month, let it be done early in this. Bulbous roots, intended for forcing in water early, may now be placed on hotbeds, and let all others be finished planting during the month. Those in pots or tubs must be frequently watered, and placed as near the sun and light as possible; for in the winter they will draw up weak. Composts wanted for forcing in spring should now be collected; peat, sand, willow earth, rotten tan, dung, &c. must be laid in dry sunny places, and frequently turned over, but by no means in the open places. Gravel walks near the house must be rolled a little when the weather will permit; their being kept hard prevents weeds growing; but never throw them up into the air. Leaves should be constantly swept up as they fall, or they will spoil the walks. Myrtles against walls should have two boards six inches wide fixed, one at each side, with a mat on the top, on which a mat should be nailed up and down occasionally. Plant early in the month all bulbous roots; particularly those for forcing. Shrubberies should be pruned, and the ground hoed. All sorts of shrubs and trees must be finished planting early in the month; litter, straw, or turf, turned downwards, and laid over the roots to keep out the frost. Drains should be dug, and drains made to carry off the water wherever it stands; a large drain, placed downwards in the earth, will carry off a great quantity of water.

GARDEN and ORCHARD. Finish any sowing omitted last month, that has been omitted, &c. Finish gathering apples and pears as they come in together and sweated; the most delicate sorts, which keep long, should be wiped with a cloth. Prune and plant apple and pear trees, and pull off the green figs. Attend to the fruit room; pick out every leaf, and all decayed apples or pears. Finish plantings at the beginning of this month, and all fruit trees. Finish planting and pruning of standard and wall trees, early in the month. Plant strawberries in pots for forcing, &c.; and attend to the alpine. Finish planting and pruning of wall trees.

GREENHOUSE. Give air in the middle of the day when very foggy. Earth the tops of any pots, when any mould appears on them. Frequently pick off geranium leaves as they decay; and give them water sparingly; also, all decayed leaves, as they decay, give air of the house very much. Succulents, as aloes, ficoides, &c. will require but little water; large aloes the most. Water plants often, but give them only little at a time; dampness is more prejudicial in a greenhouse than cold.

KITCHEN GARDEN. Asparagus must be planted for the 3d crop, and give it both light and air to colour it. If the beds be not warm enough, line them with fresh dung. Broccoli, and cabbages must be well earthed up, to keep them upright, and all decayed leaves picked off. Cauliflower plants must have air while the weather is mild, and pick off dead leaves. Earth up celery when dry, for blanching. Sow cress, mustard, and radishes, on hotbeds every week. Weed and turn over dunghills in frosty weather. Tie up endive for blanching. Hotbeds must be attended to, and plenty of hot dung and loam provided for cucumbers and melons. Lettuces under glasses must have air given them in the middle of mild days. Mushroom beds must have dry straw. Earth up peas and beans above ground. Roots preserved in sand, as carrots, potatoes, &c. should be finished before the frost sets in. Search for snails in the holes of the walls. Sow cress, mustard, and radishes, on hotbeds every week. Repair, grind, and put in order tools. Set traps to catch mice in; and make trenches to drain off the water.

FLOWER GARDEN and SHRUBBERY. Examine auriculas frequently, and pick off all decayed leaves. Bulbous roots for forcing must be constantly attended to, to give them water, which should always be soft; and change that in the glasses when foul. Carnations in pots should be plunged into the ground; but, if ashes or sand be put between the pots, it will keep them dryer than earth. Flowers and shrubs in pots should be plunged into the ground, to keep the frost from the roots. Forest trees may still be planted, if there be not much frost; otherwise it is better to defer it till spring. Shrubs and trees may still be pruned; and long litter, &c. laid over the roots of those lately planted. Trenches and drains should be made wherever the water stands.

FRUIT GARDEN and ORCHARD. Examine apples and pears in the fruit room; pick out such as appear the soundest of the best sorts, and wrap each in a piece of paper. This will cause them to keep several weeks longer. Repair espaliers; prune the trees; spread some rotten dung on the border, and fork it in. Finish pruning fig trees. Guard the fruit room from frost, but give it some air, when the weather is not very damp nor frosty. Examine the orchard, and take care that the newly planted trees are well staked and mulched; and cut out the dead wood from the standard trees. Finish pruning and planting wall trees early in the month.

GREENHOUSE. Air must be given whenever the weather is mild and will permit it. Earth the tops of the pots, but first take out a little of the old. Frost must be guarded against, by keeping the doors and windows close, when it begins to freeze. Constantly pick off decayed leaves. Myrtles and other greenhouse plants against walls will require to have mats placed before them, and, in the middle of fine days, before the frost is set in, rolled up, but let down again at night. Long litter, or rotten tan, should also be laid over the roots

GARDENING.

See

he frost. Myrtles may al-
pits made against a south
by frosty weather with mats
near a foot thick. Many are preserved
near London, with only hurdles
er the pit, without any glass, and covered
ick in frost with straw and mats. Succu-
will require but very little water. Wa-
plants which require it very sparingly.
rindows for 3 or 4 hours in the middle
day.

CATALOGUE of FLOWERS, SHRUBS, TREES USUALLY CULTIVATED.

TENDER ANNUAL FLOWERS.

Sown on a strong hotbed the last week in March, transplanted afterwards in another at 4 inches distance; then in small pots in May; afterwards in larger, and of June placed in the open air.

- | | |
|--------------|--------------------|
| Antennaria | 6. Humble plant |
| Asperula | 7. Ice plant |
| Campanula | 8. Sensitive plant |
| Centaurea | 9. Stramonium |
| C. amarantha | |

II. ANNUAL FLOWERS.

Sown on a moderate hotbed in March or April, transplanted afterwards before they are too high in light earth, and covered with mats; in the month or six weeks into pots, or border flower-garden.

- | | |
|--------------|----------------------|
| Antennaria | 8. French marygold |
| Asperula | 9. Marvel of Peru |
| Campanula | 10. Mignonette |
| Centaurea | 11. Nolana |
| C. after | 12. Palma Christi |
| C. or Indian | 13. Stock Julyflower |
| | 14. Sultan, yellow |
| anthemum. | 15. Zinnia |

Give them, six numbers to them, corresponding to these, to distinguish each sort when they come.

III. HARDY ANNUAL FLOWERS.

Sown in March or April on the borders of a garden. Those marked thus †, being hardy, may be sown in the beginning of the flower early. Hollow the earth out a little basin, about a foot over, and deep; draw a circle near the edge half an inch deep, and drop a few seeds in it; thin after they appear, and leave them at 6 inches, but the large sorts wider. In the autumn, they will want frequent watering. Save the seeds as they ripen, and you may save the trouble of buying any in another season.

In July, sow again annual stock, candy tuft, convolvulus minor, cornbottles, Lobel's catchfly, and yellow lupines, and they will flower until the frost kills them.

IV. BIENNIAL FLOWERS.

To be sown in March or April in beds very thin; as soon as the plants touch one another, thin them, and leave them at 4 or 6 inches asunder; those drawn out, plant at the same distance. In July transplant them all upon beds, at eight inches asunder; there to remain till the end of September, when they must be planted upon the borders of the flower garden, and they will produce their flowers the next summer, after which they will perfect their seeds and die.

| 14. Peach | 21. Walnut |

Following method may be taken for *preserving*
blossoms of fruit-trees in spring. Procure
rep-burdles made of hazel or willow
about 2 or 3 feet higher than the walls.
just before the blossoms of the fruit-
in to open, place these before the trees,
n them in windy weather with stakes,
eir being taller than the walls are high,
be set sloping about two feet from the
f the wall, which will keep them steady.
e fruit is set, and entirely out of danger,
n quite away, and by keeping in a dry
ey will last many years, and will be al-
th one 3d of the first cost for lighting
in unfit for any other use.

Experiment that was made, the hurdles
ed before the trees in December; they
ded a crop of peas, and both seemed to
benefited, particularly the peas. Poi-
s might also thus be defended in spring,
e forwarder; at least it is worth trying
e walls are not too high.

XIV. HARDY GREENHOUSE PLANTS.

To be planted against a south wall, in the open
ground, the roots covered with tan or long litter.
These will not be killed except in very severe frosts,
and then they generally shoot up afresh from their
roots. By this method, many curious plants,
formerly only kept in greenhouses, will now orna-
ment the walls, where they will appear in great-
er vigour and beauty, and many may produce
both flowers and fruit, which they will not do
when confined in pots in a greenhouse.

in the army, the son of Capt. Patrick
of the family of Torwood-Head, by
Hodge of Gladsmuir. His father had
the army under K. William III and Q.
1 died in Germany, after the battle of
His maternal uncle, Col. Hodge, was
the battle of Stecnkirk, in 1692; and
brother, Robert Gardiner, at the siege
; in 1695. Our hero was born at Car-

G A R

riden, Jan. 10th, 1688. He was educated at Lin-
lithgow, and made a very considerable progress
in the languages; but having a kind of hereditary
attachment to the military life, he served very ear-
ly as a cadet; and at 14 years of age, bore an en-
sign's commission in a Scots regiment in the Dutch
service, wherein he continued till 1702; when he
received a similar commission in a British regiment
from Q. Anne, which he bore in the famous bat-
tle of Ramillies. In this memorable action, being
sent on a desperate service, with a party of what
is called the FORLORN HOPE, he very narrowly
escaped with his life. While calling to his men,
a musket ball entered his mouth, and without
touching his tongue or his teeth, went through
his neck, and came out about 1½ inch on the left
side of the vertebræ. Not feeling the pain at first,
he began to suspect he had swallowed the ball, till
he fell with loss of blood. After this he passed
two nights and all next day in the open air, in ex-
treme

could we and had his wound dressed by an ig barber-surgeon; in spite of which he recovered. In 1706, he was raised to a lieutenancy, and soon after was made a cornet in Lord Stair's reg. of Scots Greys; and in 1711, a capt. lieutenant of dragoons. When the E. of Stair went ambassador to France, he appointed him his master of horse. In 1715, he was promoted to a captaincy, and in 1717 to a majority. In 1724, he was made major of an older regiment; in 1730, he was advanced to the rank of lieutenant colonel, and in 1743, to that of colonel of a regiment of dragoons; at the head of which he fell, fighting bravely for his country, at the battle of Preston parr, on the 21st Sept. 1745; in the 38th year of his age. In his person he was tall, graceful, strong built, and well proportioned. And being endowed with a strong constitution, he in his younger years plunged so deep in every fashionable vice, that his companions styled him the *happy rake*. But in this vortex of vice and dissipation, he was suddenly arrested in a manner almost, if not entirely *miraculous*. Our limits permit us not to quote the full account of this *phenomenon* given by Dr Doddridge, in his work entitled *Remarkable passages in the Life of Col. Gardiner*; but the substance of it is as follows: In July 1719, Major Gardiner, having spent the sabbath evening with some gay company till 11, and having an assignation with a married woman at 12, in order "to kill the tedious hour," took up a book, left by his mother or aunt in his chamber, entitled *The Christian Soldier*; wherein he expected to find some amusement from the author's spiritualizing the terms of his profession. But while reading it carelessly, he was surprised by a sudden and extraordinary blaze of light; and upon looking up, beheld to his astonishment a visible representation of our Saviour on the cross, suspended in the air, and surrounded with glory; while at the same time he thought he heard a voice, saying, "Oh sinner, did I suffer this for thee, and are these thy returns?" Struck with this amazing phenomenon, he sunk down in his arm chair, and continued for some time insensible; from which circumstance Dr Doddridge often suggested to him, that he was perhaps all the time asleep, and dreaming; but he himself considered it as not a dream, but a real waking vision. Be that as it may, the consequences were as salutary, as if an angel had been sent express from heaven to convert him; and from that time to his death he became as eminently distinguished for piety as he had formerly been for profanity. In July 1726, he married Lady Frances Edmonstone, daughter of the E. of Buchan, by whom he had 13 children. From the numerous anecdotes recorded of this great and good man by Dr Doddridge, we shall only add one more, which may afford an useful example to others in an age wherein duelling is so frequent. He had been so much addicted to this fashionable folly in his younger years, that he had fought 3 duels, before he was quite a man; but being challenged to fight a 4th after his conversion, he made this calm reply;—"I fear *fighting*, though you know I do not fear *fighting*." Dr Doddridge has summed up his character in few words, in the

quotation from Virgil prefixed as a motto work:

—*Iustior alter*

Nec pietate fuit, nec bello major &

(1.) * GARGARISM. *n. f.* [*gargare garyme*, French.] A liquid form of u with the mouth with. *Quincy*.—Apoph

ifus draw the rheum down by the pa-
is Nat. Hist.

GARGARISMS are used when the mouth
 are inflamed, or ulcerated. A small
 may be taken into the mouth, and mo-
 about, and then spit out; or if the
 not do this, the liquor may be injected
 &c. When gargles are required, their
 be more frequently repeated than is
 common practice.

ARGARISE. *v. a.* [*γάργαιζω*; *garga-*
ch.] To wash the mouth with medica-
 —Vinegar, put to the nostrils, or *gar-*
 with ease the hiccough; for that it is af-
 and inhibiteth the motion of the spirit.
ist. Hist.—This being relaxed, may make
 of the larynx; as when we *gargarize*.
Elements of Speech.

ARGET. *n. f.* A distemper in cattle.—
 appears in the head, maw, or in the
ts. Mort. Husb.

GARGET, consists in a swelling of the
 and the neighbouring parts; to prevent
 eding in the spring is recommended.

IL, a distemper in geese, which by stop-
 head frequently proves mortal. Three
 es of garlic, beaten in a mortar with
 ter, made into little balls, and given fast-
 he ordinary means of cure.

ILESSE, a town of France, in the dept.
 5 miles SE. of Argenton.

GLE. *n. f.* [from the verb.] A liquor
 with the throat is washed.—His throat was
 with one of the *gargles* set down in the
 cure. *Wifeman.*

GARGLE. *v. a.* [*gargouiller*, French; *gar-*
Ital. gurgel, Germ. the throat.] 1. To
 throat with some liquor not suffered
 ely to descend.—*Gargle* twice or thrice
 poxycrate. *Harvey.*—The excision made,
 ling will soon be stopt by *gargling* with
Wifeman's Surgery.—

comb, and then they order ev'ry hair;
gargle well their throats. *Dryd. Pers.*
 rible; to play in the throat. An impro-

le which only warble long,
rgle in their throats a song. *Waller.*

arm'd you were, you ceas'd awhile to doat
 sense *gargl'd* in a eunuch's throat. *Fenton.*

GLION. *n. f.* An exudation of nervous
 a bruise, or the like, which indurates
 d immoveable tumour. *Quincy.*

NAGO, or } a quadra, or district, of

 moist eyes, staggering, and loss of ap-
ortimer.

RGOWNNO, or } a parish of Scot-
RGUNNOCK, } land, in Stirlingsh.
 bank of the Forth, 6 miles long from N.

. PART I

to S. and 3½ broad. The surface is partly hilly
 and 3000 acres are moor lands. The soil of the
 rest is partly light and sandy, partly rich loam and
 clay. Husbandry is much improved by liming,
 inclosing, &c. but the roads are still bad, and,
 multures are not entirely abolished. Grounds for-
 merly over-run with thistles and furze, now pro-
 duce 10 bolls per acre, of wheat, barley, or oats.
 Peas, beans, hay, and potatoes, are also cultiva-
 ted. The population in 1793, stated by the rev-
 Mr James Robertson, in his report to Sir J. Sin-
 lair, was 830, and had decreased 126, since 1755.

(2.) **GARGUNNOCK,** a village in the above pa-
 rish, containing about 90 houses and 400 souls, in
 1793. Each house has a small garden.

(3.) **GARGUNNOCK, PEEL OF,** an ancient fort
 in the above parish, which was taken by Sir W.
 Wallace by stratagem from the English; but of
 which few relics now remain, though its site is
 still pointed out.

GARIA, a bay on the S. coast of Newfound-
 land, 22 miles E. of Cape Ray.

GARIDELLA, in botany, *Fennel flower of*
Crete, a genus of the trigynia order, belonging to
 the dodecandria class of plants; and in the natu-
 ral method ranking under the 26th order, *Mal-
 filique*. The calyx is pentaphyllous, with leaves
 resembling flower-petals; there are five bilabiate
 and bifid nectaria; the capsules are polyspermous,
 and adhering together.

GARIEVITZA, or Mount Claudius, a moun-
 tain of Slavonia, 16 miles N. of Krakiovelika.

(1.) **GARIGLIANO,** a river of Naples, which
 runs into the Mediterranean, 8 miles E. of Gaeta.

(2.) **GARIGLIANO,** one of the 11 departments,
 into which the ci-devant Neapolitan republic was
 divided in 1798-9.

GARIOCH, CHAPEL OF, a parish of Aber-
 deenshire, anciently called *LOGIE-DURNIO*, seated
 on the N. side of the Don; about 8 miles long
 from N. to S. and 7 broad. The climate is dry
 and healthy, the surface hilly; and the soil vari-
 ous. Oats and bear are the chief produce. There
 are considerable plantations of trees, which thrive
 well. The population in 1793, stated by the
 rev. Mr Shand in his report to Sir J. Sinclair, was
 986, and had decreased 365, since 1755. The
 number of sheep was 1550, horses 209, and black
 cattle 859.

GARITENA, a town of European Turkey in
 the Morea, 32 miles W. of Argos.

GARIVAN, a town of Turkey in Bulgaria,
 near the Danube, 22 miles SW. of Driftra.

GARIZIM. See *GERIZIM*.

(1.) * **GARLAND.** *n. f.* [*garlande*, *guirland*,
Fr.] 1. A wreath of branches or flowers.—

Strephon, with leavy twigs of laurel-tree,
 A *garland* made, on temples for to wear;

For he then chosen was the dignity
 Of village-lord that Whitsuntide to bear. *Sidn.*

A reeling world will never stand upright,
 'Till Richard wear the *garland* of the realm.

—How! wear the *garland*! do'st thou mean
 the crown?

—Ay, my good lord. *Shak. Richard III.*

Then party-colour'd flow'rs of white and red
 She wove, to make a *garland* for her head.

Dryden's Fables.

Vanquish again; though she be gone,
Whose garland crown'd the victor's hair,
And reign; though she has left the throne,
Who made thy glory won by thy care. *Prior.*
Her gods and godlike heroes rise to view.

And all her faded garlands bloom anew. *Pope.*

2. The top; the principal; the thing most prized.

With every minute you do change a mind,
And call him noble, that was now your hate,
Him vile, that was your garland. *Shak.*

(1.) GARLAND is derived by Hicks from *gardel banda*, which in the northern languages signify a *nosegay artfully wrought with the hand*. The word (*§ 1. def. 1.*) denotes ornaments of flowers, fruits, and leaves, intermixed; anciently much used at the gates of temples, where feasts and solemn rejoicings were held; or at any other place where marks of public joy or gaiety were required, as at triumphal arches, tournaments, &c.

(2.) GARLAND is also used for a chaplet made of feathers, or sometimes of precious stones, worn on the head in the manner of a crown.

(1.) GARLIC, in botany. See ALLIUM.

(1.) * GARLICK, *n. f.* [*gar*, Saxon, a lance; and *lick*, the leaf that shoots up in blades. *Stimmer*, *Allium*, Latin.] It has a bulbous root, consisting of many small tubercles included in its coats; the leaves are plain: the flowers consist of six leaves, formed into a corymbus on the top of the stalk; and are succeeded by subrotund fruit, divided into three cells, which contain roundish seeds. *Miller*.—Garlick is of an extremely strong smell, and of an acrid and pungent taste. It is extremely active, as may be proved by applying plasters of garlick to the feet, which will give a strong smell to the breath. *Hill*.—Garlick has, of all our plants, the greatest strength, affords most nourishment, and supplies most spirits to those who eat little flesh. *Temple*.—

'Tis mortal sin an onion to devour;
Each clove of garlick is a sacred pow'r;
Religious nations sure, and blest abodes,
Where ev'ry orchard is o'er-run with gods. *Tate*.

(3.) * GARLICK PEAR-TREE, *n. f.* This tree is pretty common in Jamaica, and several other places of America, where it usually rises to the height of 30 or 40 feet, and spreads into many branches. When the flowers fall off the pointal, it becomes a round fruit, which, when ripe, has a rough brownish rind, and a mealy sweet pulp, but a strong scent of garlick. *Miller*.

(4.) GARLICK PEAR TREE. See CRATEVA.

(5.) * GARLICK WILD, *n. f.* A plant.

* GARLICK EATER, *n. f.* [*garlick* and *eat*.]

A mean fellow.—

You've made good work,
You and your apron men, that stood so much
Upon the voice of occupation, and
The breath of garlick eaters. *Shak. Coriolanus*.

GARLIESTOWN, a village of Scotland, in Wigtonshire, in the form of a crescent; containing 450 inhabitants in 1790.

GARLIN, a town of France, in the dept. of Pyrénées, 16 miles N. of Pau.

NE, a village in Cornwall.

MENT, *n. f.* [*guarniment*, old Fr.]
which the body is covered; cloaths;

Hence, rotten thing, or I shall shake
Out of thy garments. *Shak.*

—Our leaf, once fallen, springeth no other doth the sun or summer adorn us the garments of new leaves and flowers

Farest thing that shines below,

Why in this robe dost thou appear?

Would'st thou a while more perfect

Thou must at all no garment wear.

Three worthy persons from his fid

And dy'd his garment with their feat

—The peacock, in all his pride, does half the colours that appear in the garb British lady, when it is dressed. *Spett* him that sues for the coat, i. e. the shirt garment, take the cloak also, is a proverb too; for in the truth of the letter, a likely matter of a law suit, and signifies testing sufferance of such small losses. *A*

(2.) GARMENT. See DRESS and HAIR.

GARN, a town of Sweden, 12 m. N. GARNACHE, a town of France, in the Verdun, 3 miles NNE. of Châlons.

GARNARD, a town in the Isle of V.

(1.) * GARNER, *n. f.* [*garner*, Fr.] place in which threshed grain is stored.

Earth's increase, and toyson plenty

Barren and garner never empty. *St*

For landry faces the rural realm fur

The holdmouse builds her garner under

For gather'd grain the blind laborious

In winding mazes, works her hidden

(2.) GARNET, in geography, a river of which joins the Garraun, and runs into 4 miles SW. of Rols in Herefordshire.

* To GARNER, *v. a.* [from the noun store as in garners.—

There, where I have garner'd up

Where either I must live, or bear no

(1.) * GARNET, *n. f.* [*garnato*, Ital, low Latin; from its resemblance in color grain of the pomegranate.] The garn.

of a middle degree of hardness, between phire and the common crystal. It is so

rious sizes. Its surfaces are not so smooth as those of a ruby, and its colour is

strong red, with a plain admixture of a degree of colour is very different, and

wants much of the brightness of the rub

The garnet seems to be a species of the of the ancients: the Bohemian is red, w

cast of a flame colour; and the Syrian is a slight cast of purple. *Woodward's Me*

(2.) GARNET, in natural history.

NOTE. When pure and free from blem little inferior in appearance to the one

Among lapidaries and jewellers, genui are known by different names according

different degrees of colour. 1. The garly so called, is the finest and most valu

being of a very deep blood-red with a mixture of blue. 2. The rock ruby; a

improperly given to the garnet when it

ry strong but not deep red, and has a

blue: this is a very beautiful gem. 3. The or *sciran* garnet; that of a yet brighter approaching to the colour of native cinnabar, faint blue tinge. 4. The *almadine*, a garnet a little paler than the rock ruby.

GARNET COLOUR. See GLASS.

GARNETS, COUNTERFEIT, are made as follows: Take prepared crystal, 2 oz. red lead, 6 grains, 16 gr. zaffre, 3 gr.: Mix all well, and put into a crucible. cover it well with lute, and put in a potter's kiln for 24 hours. Or take 2 oz. minium, 5½ oz. manganese, 15 gr. red, 4 gr. Mix and bake them as above.

GARNISH. *n. s.* [from the verb.] 1. Ornament; decoration; embellishment.—

So are you, sweet,
in the lovely *garnish* of a boy. *Shak.*

utter and figure they produce;

garnish this, and that for use;

seek to feed and please their guests. *Prior.*
garnished strewed round a dish. 3. [In gaols.]

A cant term. 4. *Penfuntula carceraria*; acknowledgment in money when first a prisoner is put into a gaol. *Ains.*

GARNISH. *v. a.* [*garnir*, Fr.] 1. To deck with ornamental appendages.—There were such *garnished* their proud heights with trees. *Sidney*—

All within with flowers was *garnished*,
when mild Zephyrus amongst them blew,
breathed out bounteous smells, and painted
colours shew. *Spenser.*

With taper light
deck the beauteous eye of heaven to *garnish*,
useful and ridiculous excess. *King John.*
It was a terrestrial garden, *garnished* with
lighting both the eye and taste. *Raleigh.*
The streets were *garnished* with the citizens,
in their liveries. *Bacon's Henry VII.* 2.
To embellish a dish with something laid round it.
With what expence and art, how richly drest!
G'd with 'sparagus, himself a feast!

Dryden's Juvenal.
No man lards salt pork with orange-peel,
garnishes his lamb with spitchcock'd eel.

King's Cookery.
with fetters. A cant term.

GARNISHMENT. *n. s.* [from *garnish*.] Ornament; embellishment.—The church of Sancti in Padoua is a sound piece of good art, the materials being ordinary stone, without ornament of sculpture, ravish the beholders.

GARNITURE. *n. s.* [from *garnish*.] Furniture; ornament.—They conclude, if they fall in *garniture* of their knees, that they are in furniture of their heads. *Gov. of T.*—

In sense, which pleas'd your fires an age
on,

without the *garniture* of show. *Granv.*
Nature has poured out her charms upon the
earth of our species, so they are very assiduous
looking upon themselves the finest *garniture*.
Spektor.

Gar, a river of the Cisalpine republic, in the
department of Lower Po. It is one of the
tributaries of the Po, and falls into the Adriatic.
Port of Garo.

(1.) **GARONNE**, a fine river in the S. of France, which rises in the Pyrenees, and taking a NW. direction, waters Toulouse and Bourdeaux, below which it is joined by the Dordogne, and thence to its entrance into the bay of Biscay is called the GIRONDE. It has a navigable communication with the Mediterranean by its junction with the *ci-devant* Royal Canal. See CANAL, § 6.

(2.) **GARONNE, UPPER**, a department of France, bounded on the N. by that of Lot; on the NE. by that of Tarn; on the SE. by those of Aude and Arriege; on the S. by Spain, and on the W. by the dept. of the Upper Pyrenees and Gers. It contains part of the *ci-devant* province of LANGUEDOC. The Garonne runs through it. Toulouse is the capital.

* **GAROUS.** *adj.* [from *garum*.] Resembling pickle made of fish.—In a civet cat an offensive odour proceeds, partly from its food, that being especially fish; whereof this humour may be a *garous* excretion, and odious separation. *Brown.*

GARRACHICA, a sea port town of the isle of Teneriffe. It was destroyed by an earthquake, and overwhelmed by an eruption of the volcano on the Peak, in 1704: so that houses are now built where ships then lay at anchor.

GARRAF, a town of Spain in Catalonia, on the coast, 10 miles SW. of Barcelona.

(1.) * **GARRAN.** *n. s.* [Erse. It imports the same as gelding. The word is still retained in Scotland.] A small horse; a hobby. A Highland horse, which, when brought into the North of England, takes the name of *galloway*.—When he comes forth, he will make their cows and *gar-rans* to walk, if he doth no other harm to their persons. *Spenser.*—Every man would be forced to provide Winter-fodder for his team, whereas common *garrans* shift upon grass the year round; and this would force men to the enclosing of grounds, so that the race of *garrans* would decrease. *Temple.*

(2.) **GARRAN**, in geography, a river of England, which runs into the Wye. See GARNER, N° 2.

GARRESSIO, a town of Italy, in Piedmont, 9 miles SW. of Ceva.

(1.) * **GARRET.** *n. s.* [*garite*, the tower of a citadel, Fr.] 1. A room on the highest floor of the house.—

The mob, commission'd by the government,
Are seldom to an empty *garret* sent. *Dryden.*
—John Bull skipped from room to room; ran up stairs and down stairs, from the kitchen to the *garret*. *Arbutnot.*—

On earth the god of wealth was made
Sole patron of the building trade;
Leaving the arts the spacious air,
With licence to build castles there:
And 'tis conceiv'd their old pretence,
To lodge in *garrets*, comes from thence. *Swift.*
2. Rotten wood. Not in use.—The colour of the shining part of rotten wood, by day-light, is in some pieces white, and in some pieces inclining to red, which they call the white and red *garret*. *Bacon.*

 of a garret.
 LETSTOWN, a town of Meath, Ireland.
 ICK, David, Esq; the great Koscius of
 country, who for near 40 years shone
 luminary in the dramatic hemisphere,
 at the Angel Inn at Hereford, in 1716.
 His father, Capt. Peter Garrick, was a French refu-
 ge, and had a troop of horse which were then
 quartered in that city. This rank he maintained
 in the army for several years, and was a major at
 his death. Mr Garrick received the first rud-
 iments of his education at Litchfield; which he
 afterwards completed at Rochester, under the ce-
 lebrated Mr Colson, since professor at Cambridge.
 Dr Johnson and he were fellow students at the
 same school; and went up to London to push
 themselves into active life, in the same coach. On
 the 9th March 1736, he was entered at Lincoln's
 Inn. He soon quitted the law and followed for
 some time the business of a wine merchant; but
 at last he gave way to the irresistible bias of his
 mind, and joined a travelling company of come-
 dians at Spilwich, where he went by the name of
Lyddle. Having in this poor school of Apollo got
 some acquaintance with the theatric art, he burst
 at once upon the world, in 1740-1, in all the lus-
 tre of perfection, at the little theatre in Goodman's
 Fields, then under the direction of Henry Giffard.
 The character he first performed was Richard III.
 in which, like the sun bursting forth behind a
 cloud, he displayed in the earliest dawn a some-
 what more than meridian brightness. His unpa-
 ralleled excellence quite astonished the public. To
 see a young man, in his 14th year, and a mere
 novice to the stage, reaching at one step to that
 height of perfection, which the then capital perform-
 ers of the English stage, had not been able to ap-
 proach half way, after an experience of many
 years, was a phenomenon that could not but
 become the object of universal speculation and ad-
 miration. The theatres at the west end of the
 town were deserted; Goodman's Fields, from
 being the rendezvous of citizens and their wives,
 became the resort of all ranks of men; and Mr
 Garrick continued to act till the close of the sea-
 son. Being offered very advantageous terms for
 performing in Dublin during part of the summer
 1741, he went over, and found the same just ho-
 mage paid to his merit, which he had received
 from his own countrymen. In the following win-
 ter he engaged with Fleetwood then manager of
 Drury Lane: in which he continued till the year
 1745, when he again went over to Ireland, and
 continued there the whole season, joint manager
 with Mr Sheridan of the theatre royal in Smock
 Alley. Thence he returned to England, and en-
 gaged for the season of 1746 with Mr Rich at Co-
 vent Garden. This was his last performance as
 an hired actor; for in the close of that season Mr
 Fleetwood's patent for the management of the
 theatre in Drury Lane being expired, Mr Gar-
 rick and Mr Lazy purchased the property of it,
 novation of the patent; and in winter
 and it with the greatest part of Mr Fleet-
 y, and with the addition of Mr

Barry, Mrs Pitchard, and Mrs Cibber, in
 vent Garden. To trace Mr Garrick thro'
 various occurrences of his life, would swel-
 count to many pages. Suffice it to say,
 nued in the full enjoyment of fame to t
 of his retirement. His universality of t
 never once admitted of a competitor.
 comedy, an I farce, the lover and the
 jealous husband who suspects his wife
 caute, and the thoughtless lively rake w
 it without design, were all alike his ow
 and ridicule, doubt and despair, tran
 tenderness, compassion and contempt;
 lously, fear, fury, and simplicity: all to

 There is one part of his theatrical conc
 will ever be recorded to Mr Garrick
 while virtue, morality, and purity of p
 ners, are held in esteem: and that is
 which he showed to banish from the sta
 plays that carry with them an immora
 and to prune from those which do n
 whole, tend to promote the interests o
 scenes of licentiousness, as a redunda
 and liveliness of imagination had induc
 our comic writers to indulge in, and
 too prevalent spirit of gallantry and in
 given sanction to. The purity of t
 stage was beyond a doubt much mor
 blished during the administration of th
 minister, that it had ever been during
 managements. He carried his moral,
 pious principles with him into the te
 ment of the theatre itself, and rescued
 from that obloquy which had brier
 the profession. Of a class of men
 accounted blackguards, unworthy the
 of the virtuous, he made gentlemen, i
 with society, and introduced them to t
 of social life. The theatre was no lo
 ed the nursery of vice; and the mor
 ous, and even the religious part of n
 not hesitate to partake of the ration
 ment of a play, when they could pas

 uncorrupted by the immorality, of th
 Notwithstanding the numberless and
 vocations attendant on his profession
 and his station as a manager; yet hi
 genius frequently burst forth in vario
 ductions in the dramatic and poetic
 merit of which leads us to regret his
 to compose more extensive and impo
 Though his merit as an author is no
 magnitude, yet his great knowledge
 manners, of stage effect, and his ha
 lively and striking satire, made him;

d his prologues and epilogues in part:—
 are almost innumerable, possess such
 perfection, both in the conception and
 as to stand unequalled. His Ode on
 of Mr Pelham run through 4 editions
 in six weeks. His Ode on Shakespeare
 by piece; and when delivered by him-
 self, most capital exhibition. His altera-
 tions of Shakespeare and other authors have been
 successful, and at times exploded. The
 the grave-digger's scene from Hamlet
 be forgiven by the frequenters of the
 Drury Lane. Though necessary to the
 of the scene, they are unwilling to lose
 erling wit and humour; and it must be
 at exuberances of that kind, though
 the uniformity, yet increase the luxuri-
 : piece. Among the plays he altered
 following: Every man in his Humour,
 Jonson; Romeo and Juliet, Winter's
 crine and Petruchio, Cymbeline, Ham-
 om Shakespeare; Gamblers, a come-
 Shirley; and Isabella, from Southerne.
 original productions, The Farmer's
 nd Linco's Travels, interludes; The
 Lethe, Lying Valet, Miss in her Teens,
 et, Irish Widow, and other comedies
 ; The Enchanter, a musical entertain-
 liput, the Christmas Tale, and many o-
 have thus traced him to the period of
 ment in spring 1776; when, full of
 a splendid fortune, and advancing in
 ought to enjoy in the vale of life that
 nd honourable ease, which he had so
 d by the activity and merits of his dra-
 . But short was the period allotted to
 enjoyment: for he died on the 20th
 , leaving not a single rival in excellence
 to compensate for his loss.

 Wirtemberg, $4\frac{1}{2}$ miles NNW. of Heilbronn.

GARTAU, a town of Lunenburg Zell, 12 m.
 E. of Lucknow, and 48 ESE. of Lunenburg.

GARTEMPE, a river of France, which runs
 into the Creuse, near Roche-Pofay, in the dep. of
 Indre and Loire.

(1.) * GARTER. *n. f.* [*gardus*, Welsh; *jar-
 tier*, French; from *gar*, Welsh, the binding of
 the knee.] 1. A string or ribband by which the
 stocking is held upon the leg. Let their heads be
 sleekly comb'd, their blue coats brush'd, and their
garters of an indifferent knit. *Shak.*—When we
 rest in our cloaths we loosen our *garters*, and o-
 ther ligatures, to give the spirits free passage.
Ray.—

Handsome *garters* at your knees. *Swift.*

There lay three *garters*, half a pair of gloves,

And all the trophies of his former loves. *Pope.*

2. The mark of the order of the garter, the high-
 est order of English knighthood.—

Now by my george, my *garter*.

—The

—The george, profan'd, hath lost his only honour;

The garter, blemish'd, pawn'd his knightly virtue. *Shak.*

You owe your Ormond nothing but a son,
To fill in future times his father's place,
And wear the garter of his mother's race. *Dryden.*

3. The principal king at arms.

(2.) GARTER, in heraldry, a moiety, or the half of a LEND.

(3.) GARTER, ORDER OF THE, a military order of knighthood, the most noble and ancient of any lay order in the world, instituted by Edward III. The knights companions are generally princes and peers; and the king of England is the sovereign of the order. The number of knights was originally 26; but six were added in 1786, on account of the increase of the royal family. They are a corporation, having a great and little seal, &c. Their officers are a prelate, chancellor, register, king at arms, and usher of the black rod. They have also a dean, with 12 canons, and petty canons, vergers, and 26 pensioners or poor knights. The prelate is the head. This office has always been vested in the bishop of Winchester. Next to the prelate is the chancellor; which office is vested in the bishop of Salisbury, who keeps the seals, &c. The next is the register, who by his oath is to enter upon the registry, the fortunes, elections, penalties, and other acts of the order with all fidelity: The dean of Windsor is always register *ex officio*. The 4th officer is Garter and King at arms, being two distinct offices united in one person. (See § 5.) He is the principal officer within the college of arms, and chief of the heralds. See KING AT ARMS. All these officers, except the prelate, have fees and pensions. The college of the order is seated in the castle of Windsor, within the chapel of St George, and the charter-house, erected by the founder for that purpose. The habit and ensign of the order are a garter, mantle, cape, george, and collar. The three first were assigned the knights companions by the founder; and the george and collar by Henry VIII. The garter challenges pre-eminence over all the other parts of the dress, as from it the order is denominated. It is the first part of the habit presented to foreign princes and absent knights, who, as well as all other knights elect, are therewith first adorned; and it is of so great honour and grandeur, that by the bare investiture with this noble ensign, the knights are esteemed companions of the greatest military order in the world. It is worn on the left leg between the knee and calf, and is enamelled with this motto, *HONI SOIT QUI MAL Y PENSE*. (See § 4.) The mantle is the chief of these vestments made use of upon all solemn occasions. The colour of the mantle is by the statutes appointed to be blue. The length of its train only distinguishes the sovereign from the knights companions. To the collar of the mantle is fixed a pair of long strings, anciently woven with blue silk only, but now of round, and made of Venice gold and silk, or of the robe; with knobs or buttons to the end. The left shoulder has from been adorned with a large garter,

with the device, *HONI SOIT, &c.*

is the cross of the order, which was first be worn at all times by king Charles I. the star was introduced, being a sort of diadem with beams of silver. The collar is composed of pieces of gold in the shape of garters, the ground enamelled blue, and set with gold. In 1551, Edward VI. made alterations in the ritual of this order; that he put it in Latin, the original whereof was in his own hand-writing. He then decreed that the order should no longer be called of St George, but the order of the garter, instead of the George, hung at the collar. He instituted a cavalier, bearing a boar on his sword, with the word, *prolehi* the sword, and *verbum Dei* on the boar's buckle in the left hand, and the word *on*. When the knights do not wear it, they are to have a silver star on the left; they commonly bear the picture of the cross enamelled on gold, and beset with diamonds at the end of a blue ribbon, crossing the left shoulder. They are not to appear without the garter, on penalty of 6s. the register. The manner of electing a companion into this most noble order, and the ceremonies of investiture, are these: The sovereign designs to elect a companion; the chancellor of the order draws the names, which, passing both under the sign manual and signet of the order, the person by Garter principal king at arms, which is of blue velvet bordered with gold wire, having the letters of the motto on the time of election, buckled upon it by two of the senior companions, who present it from the sovereign, to whom it was presented upon a velvet cushion, by the king at arms, with the usual reverence, the chancellor reads the following admonition by the statutes: "To the honour of Almighty God, and in memorial of the blessed St George, tie about thy leg, for this noble garter; wear it as the sign of this most illustrious order, never to be so laid aside; that thereby thou mayest be encouraged to be courageous; and having us in just war, in which thou shalt be engaged, mayest stand firm, valiantly fight, and conquer." The princely garter being put on, and the word of its signification read, the knight elect is brought before the sovereign, who puts about his neck, kneeling, a blue ribbon, whereunto is appendant in gold within the garter, the image of St George on horseback, with his sword drawn, and a dragon. In the mean time the chancellor reads the following admonition: "this ribbon about thy neck, adorned with the image of the blessed martyr and soldier of St George, by whose imitation prove thou mayest so overpass both prosperous and adverse adventures, that having stoutly vanquished thy enemies both of body and soul, thou mayest only receive the praise of this transient life, but be crowned with the palm of eternity." Then the knight elect kisses the

books his majesty for the great honour; rises up, and salutes all the company, who return their congratulations. Institution of this order, there have been kings and all kings, besides numerous sovereigns, enrolled as companions.

GARTER, ORIGIN OF THE ORDER OF THE. Various accounts related by historians. The most not improbable account is, that the king of Salisbury happening at a ball to drop his garter, the king took it up and presented it to him with these words, "*Moni soit qui mal y pense*;" to him that evil thinks. This accident led to the order and the motto; it being the custom of the times to mix love and war together. Original statutes however there is not the least allusion to such a circumstance, farther conveyed in the motto. Camden, Fern, and others, say the order to have been instituted on occasion of the victory obtained by Edward over the Scots at the battle of Crassay. That prince, historians, ordered his garter to be displayed as a signal of battle; in commemoration of which he made a garter the principal ornament of the order erected in memory of this signal victory. A symbol of the indissoluble union of the king and his subjects.

And they account for the motto, that the king having laid claim to the kingdom of France, and denounced shame and defiance upon him who should dare to think amiss of the just enterprise undertaken for recovering his lawful crown; and that the bravery of those knights whom he had elected into this order was such as would enable him to maintain the quarrel, and that *he* that thought ill of it. This interpretation, however, appears to be rather forced. A more ancient origin of this order is given in *Parville*, lib. vi. quoted by Granger, in the 1st to his *Biographical History*: viz. that it was instituted by Richard I. at the siege of Acres, and consisted of 26 knights, who firmly stood by their sovereign's thongs of blue leather about their waists, that it was revived and perfected in the reign of Edward III.

GARTER PRINCIPAL KING AT ARMS. The principal king at arms, are two distinct offices in one person: Garter's employment is to attend the service of the order of the garter; for which he is allowed a mantle and badge, a house or castle, and pensions both from the king and knights, besides fees. He also carries a sword and sceptre at every feast of St George, when the sovereign is present, and notifies the names of such as are newly chosen; attends the coronations of their installations, and funerals; and of placing their arms over their seats; and presents the garter to foreign kings and princes, and in that service it has been usual to join him in arms with some peer, or other person of rank. Garter's oath relates only to services performed within the order, and is taken before the sovereign and knights. The oath of a king at arms, is taken before the earl

GARTER. v. g. [from the noun.] To bind. *ter.*—He, being in love, could not see his horse. *Shak.*—A person was wound-

ed in the leg, below the gartering place. *Wizeman's Surgery.*

(1.) **GARTH**, Sir Samuel, an excellent English poet and physician, descended from a good family in Yorkshire. He studied at Cambridge where he took the degree of M. D. in 1691, and was admitted into the college of physicians at London in 1693. He zealously promoted the erecting of the dispensary for the relief of the sick poor. This work of charity having exposed him and many other philanthropic physicians to the resentment of others of the same faculty, he ridiculed them, with peculiar spirit and vivacity, in a poem called the *Dispensary*, in six cantos, highly esteemed. He was one of the most eminent members of the Kit-Kat Club. See **KIT-KAT**. Upon the accession of George I. he was knighted, and made physician to his majesty, and the army. Nor were these more than just rewards of his physical as well as political merits. He had gone through the office of censor of the college in 1702; and practised always with a strict regard to the honour of the faculty, never prostituting the dignity of his profession, from interested motives, to any even the most popular and wealthy apothecaries. He had a very extensive practice, but was very moderate in advancing his own fortune; his humanity inclining him more to use the great interest he had, for the encouragement of other men of letters. He lived with the great in that degree of independence which became a man possessed of superior genius. One of his last performances was his translation of the 14th book, and the story of Cippus in the 15th of Ovid's *Metamorphoses*. These, with an English version of the rest, were published in 1717; and he prefixed an excellent preface to the whole, wherein he not only points out the principal beauties of the poem, but shows its uses, and how it may be read to most advantage. He died in Jan. 1718—19; and his death caused a general concern; which was particularly testified by lord Lansdown, a brother poet, though of a different party, in some admirable verses written on the occasion.

* (2.) **GARTH**. *n. f.* [as if *girth*, from *gird*.] The bulk of the body measured by the girdle.

(3.) **GARTH** is used in some parts of England for a little back-yard or close. It is an ancient British word. *Gardd*, in that language, signifies garden, and is pronounced *garth*. It is also used for a dam or wear, &c.

GARTH-MAN, in the old English statutes, one who catches fish by means of fish garths, or wears. See **GARTH**, N° 3. By statute 17. Ric. II. c. 9. no fisher, nor garth-man, shall use any nets or engines to destroy the fry of fish, &c. The word is supposed to be derived from the Scotch word *gart*, the preterite of the verb, *To GART*, i. e. to force or compel; because fish are forced by the wear to pass into a loop, where they are taken.

GARTLY, a parish of Scotland, in Banffshire, 12 miles long from E. to W. 6 broad, and of an irregular oval form. It is divided nearly in the centre, by the Bogie, and bounded on the E. and W. by heath-covered hills. The soil is fertile, and produces luxuriant crops of oats, bear, pease, potatoes, turnips and cabbages; husbandry being much improved. The population in 1793, stated by

by the rev. Mr. James Scott, in his report to Sir J. Sinclair, was 1800, and had increased 472, since 1755. The number of horses was 340; of sheep, 4,500, and of black cattle, 1,500. A man died in it, in 1788, aged 102.

GARTMORN DAM, an artificial lake in Clackmannanshire, formed about the beginning of the 18th century, for the use of the Alloa coal-works. Mr J. F. Erskine of Marr thus describes it: When full it covers 162 English acres. The head is faced with rough hewn stone, and measures 320 yards. It is a sluice, which regulates the quantity of water to be conveyed into a lade, which first drives a mill for chipping wood and dye stuffs; next a lint mill; then it is conveyed into pipes forcing it up to a engine, that draw up the water and the coals from the pits; after which it is collected into a smaller dam, and conveyed thence in a lade, to a set of mills in Alloa for grinding wheat, oats, malt, and barley; which are capable of grinding 400 bolls, or 250 quarters in a day. There are 2 large wheels, 19 feet diameter in the centre of the house, which drive the whole machinery, in both ends of the mills. From these mills, the water falls into a rivulet, that runs through Alloa, drives a snuff and fulling mill, and passing through Mr Erskine's pleasure grounds, comes near the harbour, where it is again confined by a strong dam of earth, a large sluice, and a long trough, both of stone; which gives it a prodigious velocity for clearing the harbour; so that this little water, originally a branch of the Black Devon, is made to serve the most important purposes, by driving 7 mills besides clearing the harbour. *Stat. Acc. Vol. VIII.*

(1.) **GARTZ**, a town of Germany, in Prussia, near the marche of Brandenburg. Lon. 14. 18. E. Lat. 53. 13. N.

(2.) **GARTZ**, a town of Pomerania, in the isle of Rugen, on the site of the ancient Carenz.

GARUAGH, a town of Ireland, in Derry.

GARVAGHY, a town of Ireland, in Down.

(1.) **GARVOLD**, [Gael. from *gar*, rugged, and *vold*, a burn.] a parish of Scotland, in Haddingtonshire, united with that of **BARO**, in 1702. Agreeably to its Gaelic name, it is watered by a very rugged rivulet, which, when swelled by the rains, overflows its banks. The two parishes extend from E. to W. 8½ miles, and from N. to S. about 4½. The air is pure and healthy. The soil is partly light gravel, and partly deep rich clay. Wheat, barley, oats, pease, turnips, potatoes and clover, are the produce. Husbandry is highly improved. The farmers are uncommonly intelligent. The population of both parishes in 1791, stated by the rev. Mr Andrew Nesbet, in his report to Sir J. Sinclair, was 730, and had decreased 44, since 1755. The number of horses was 314; of sheep 6080; and of black cattle, 575. There are several antiquities in the parishes, particularly the ruins of White-castle, the ancient castle of Yester, and a large fortification on a rising ground of a circular form, 1500 feet in circum-

WALD, a village in the above parish, situated on the rivulet above described, which, swelled to such a pitch, that it

had almost swept the village totally away, and tained 214 inhabitants in 1791.

GARVAO, two towns of Portugal, 1. on the S. side of the Tajo, 12 miles from Lisbon; 2. six miles W. of Ourique.

GARVELACH, an island on the N. of Argyllshire, 8 miles SE. of the isle of Mull.

GARVILANS, an island on the N. of Ireland, in Donegal, 2 miles ESE. of Ballyshannon.

GARUMNA, a navigable river of Gaul, rising from the Pyrenees, anciently Aquitain on the N.; but, by a re Augustus, divided it in the middle: the N. of Burdegala, into the Aquitani. It is now called GARONNE. Mela observes, unless it is swelled by winter rains, or of the snow, it is for a great part shoaly and scarce navigable; but when by the meeting tide, whereby its waters are pelled, it is somewhat fuller, and the river advances, it is broader, till at length it resembles an extensive frith; not only by vessels, but swelling like a raging sea, extremely, especially if the direction be one way and that of the current air.

(1.) **GARVOCK**, [Gael. *i. e.* the hill of Scotland, in Kincardineshire, 12 miles S. of the Grampians, one mile high, steep on the N. side, but having a gradual descent of 4 miles on the S.

(2.) **GARVOCK**, a parish in Kincardineshire, partly seated on the above hill, (N. 10. E. 36 miles N. of Culterin, and 53 N. of Aberdeen.) It was surrounded with walls in 1248.

GARZA, a small river of the Cisalpine, in the dep. of Mela, and late province of Africa, in the F. S. of Menilla. The houses are built of mud.

(1.) * **GAS**. *n. f.* [A word invented by Van Helmont.] It is used by Van Helmont, to signify, in general, a spirit when being coagulated: but he uses it loose senses. *Harris.*

(2.) **GAS** is a general name for all aerial kind, except common air. from the German *gascht* or *gast*, signification of wind, or the ebullition, or expulsion of elastic fluids from sublimation of fermentation or effervescence. It is given by Van Helmont to the vapour, the same with the fluid after fixed air, now carbonic acid, and other factitious airs. From him it has been employed by modern philosophers as a general one for all the elastic fluids ab-

invariant. Under the article *ANATOMY* and properties of these fluids are according to the tenets and language HEP. and others, at the time when that celebrated work *On different kinds of Air* occupied the attention of the philosophers.

Many additional discoveries, however, since made, and a new language indicative of the component parts of gases undergoing any chemical change, will find the subject treated in a still new way under the article *CHEMISTRY*. *ARN*, a town of Sweden, in the prov. of Å, 41 miles NNE. of Carlscadt.

IGN. See *GASCOIN*.

SCOIGNE, George, an English poet some time in the reign of Q. Elizabeth. He was of Essex, of an ancient family, and educated at Oxford and Cambridge. From thence he went to Gray's Inn, but, having a genius for the law, he travelled and for some time in the army in the Low Countries. He then went to France, where he became acquainted with a Scottish lady, and married her. He returned to England, and settled once more at Gray's Inn, where he wrote most of his poetry. The latter part of his life he spent in his native place of Walthamstow, where he died in 1587. The character of a polite gentleman, a patron, *et vir inter poetas sui seculi præcipuus*. His plays, first printed separately, were afterwards re-printed with other poems, in 1600; in 1577 and 1587.

SCOIGNE, Sir William, chief justice of the Bench under Henry IV.; a most learned judge, who, being insulted on the throne by the then prince of Wales, afterwards with great coolness and intrepidity committed him to prison; and by this intemperate foundation of the future glory of the monarch, who from this event dated his reign from licentiousness. It is not related that the prince struck Sir William, nor is it recorded by Shakespeare; but all authors agree that he interrupted the course of justice to the prince's servant. Sir William died in 1413.

IN, or *GASCOIN*, is the hinder thigh which begins at the stifle, and reaches to the bending of the ham.

ONADE. *n. f.* [French; from *Gastol*, a name for boasting.] A boast; a brag; to brag; to bluster.

NES, or *VASCONES*, the ancient inhabitants of Gascony, called by the moderns, *Basques*, or *GASCOONS*. See next articles.

NY, a ci devant province of France, lying between the N. by Languedoc and the Pyrenees on the S. and by the sea on the W. It had its name from the Gauls, its ancient inhabitants. After being subdued by the Franks, they had for some time of their own, who were subject to the kings of Aquitaine; but both were at last by the kings of France. It produces

PART. I.

corn, wine, fruit, tobacco, hemp, brandy, prunes, &c. It now forms along with *ARMAGNAC* the department of *GERS*.

GASCOONS, the people of the ci-devant province of Gascony. They are noted for a corrupt pronunciation of the French tongue, as well as for boasting and rhodomontade.

GASCUENA, a town of Spain, in New Castile, 30 miles NNW. of Cuenca.

GASEOUS, *adj.* Belonging to Gas. See *Gas*.

* *GASH*. *n. f.* [from the verb.] 1. A deep and wide wound.—

He glancing on his helmet, made a large
And open *gash* therein; were not his target,
That broke the violence of his intent,
The weary soul from thence it would discharge.

Spenser.

A perilous *gash*, a very limb lapt off.

Shakspeare. Hen. IV.

—Hamilton drove Newton almost to the end of the lists; but Newton on a sudden gave him such a *gash* on the leg, that therewith he fell to the ground. *Hayward.*—

But th' ethereal substance clos'd,

Not long divisible; and from the *gash*

A stream of nectarous humour issuing flow'd.

Milton.

2. The mark of a wound. I know not if this be proper.—I was fond of back sword and cudgel play, and I now bear in my body many a black and blue *gash* and scar. *Arbush.*

* *To GASH*. *v. a.* [from *hacher*, to cut, French. *Skinner*] To cut deep so as to make a gaping wound; to cut with a blunt instrument so as to make the wound wide.—Where the Englishmen at arms had been defeated, many of their horses were found grievously *gashed* or gored to death.

Hayward.—Wit is a keen instrument, and every one can cut and *gash* with it; but to carve a beautiful image requires art. *Tillotson.*—

See me *gash'd* with knives,

Or fear'd with burning steel. *Rome's R. Com.*

Streaming with blood, all over *gash'd* with wounds,

He reel'd, he groan'd, and at the altar fell.

A. Phillips.

GASK, [Gael. *i. e.* a slope,] a parish of Perthshire, bounded on the S. by the Barn, and in form nearly a square, each side of which is above two miles. An ancient Roman causeway runs through it, and the ground *slopes* gradually down from it on each side. This causeway is 20 feet broad, and is in high preservation; being composed of rough stones laid close together; leading W. to one camp still visible in the parish of Muthil, and E. to another in that of Scone. Vestiges of other two camps on the N. and S. surrounded by ditches, are also visible. The air is dry and healthy; the soil is fertile, and produces wheat, barley, oats, pease, potatoes, turnips, and clover. The population, stated by the rev. Mr David Kemp, in his report to Sir John Sinclair, was 485, in 1790; when there were 50 sheep, 131 horses, and 648 black cattle in the parish.

* *GASKINS*. *n. f.* [from *Gastaigne*. See *GALLIGASKINS*.] Wide hose; wide breeches. An old ludicrous word.—

If one point break, the other will hold;
Or, if both break, your *gasps* fall. *Shakefp.*
* *GASP*. *n. f.* [from the verb.] 1. The act of
opening the mouth to catch breath. 2. The short
catch of breath in the last agonies.—

His fortunes all lie speechless, and his name
Is at last *gasp*. *Shakefp. Cymbeline.*

Ah, Warwick, Montague hath breath'd his
last;

And to the latest *gasp* cry'd out for Warwick.

Shakefp. Hen. VI.

If in the dreadful hour of death,
If at the latest *gasp* of breath,

When the cold damp bedews your brow,
You hope for mercy, shew it now. *Addis. Ros.*

* To *GASP*. *v. n.* [from *gasper* Sinner; from
gipse, Danish, to sob, *Ynnus*.] 1. To open the
mouth wide; to catch breath with labour.—

The sick for air before the portal *gasp*. *Virg.*

They rais'd a feeble cry with trembling notes;

But the weak voice deceiv'd their *gassing* throats.

Dryd. n.

The *gassing* head flies off; a purple flood

Flows from the trunk. *Dryden's Æn.*

The ladies *gasp'd*, and scarcely could respire;

The breath they drew no longer air, but fire.

Dryden.

—A scantling of wit lay *gasp*ing for life, and groan-
ing beneath a heap of rubbish. *Dryden's Spangb*
Friar.—The rich countrymen in Aulonia were faint
and *gasp*ing for breath. *Brown's Trav.*

Pale and faint,

Hegasp for breath; and, as his life flows from him,

Demands to see his friends. *Addis. Cata.*

1. To emit breath by opening the mouth convul-
sively.—

I lay me down to *gasp* my latest breath;

The wolves will get a breakfast by my death.

Dryden.

He staggers round, his eyeballs roll in death,

And with short sobs he *gasp*s away his breath.

Dryden's Æn.

3. To long for. This sense is, I think, not prop-
er, as nature never expresses desire by *gasp*ing.—
The Castilian and his wife had the comfort to be
under the same master, who, seeing how dearly
they loved one another, and *gasp*ed after their li-
berty, demanded a most exorbitant price for their
ransom. *Spettator*.

GASPAR ISLAND, an island and channel in
GASPAR STRAITS, the Eastern Seas, between
the isles of Banca and Billiton. Lon. 107.0. E.
Lat. 1. 45. S.

GASPARINI, a celebrated grammarian, born
at Barzizia, about 1370, who contributed much
to the revival of learning in Europe. He read
Cicero, Cæsar, Virgil, &c. entered into their spi-
rit, and communicate it to his pupils. He was
invited to be professor of belles lettres at Padua,
but the duke of Milan retained him and loaded
him with favours. He wrote commentaries on
Cicero, and Letters and Orations, reprinted in
1723, with a curious and useful preface. He died
in 1431.

GASPE, or **GACHEPE**, a bay and head land
America, S. of Florell isle, E. of Lower Ca-
1 W. of the Gulf of St Lawrence.

GASPEE, or **NAMUIT POINT**, a
America, projecting from the W. of
Providence. Here a British armed schi-
ed the *Gaspree*, was burnt the 20th Jan
about 60 men from Providence, patri-
dians.

GASPESIA, a tract of country,
Canada, S. of the Lawrence, and N. of
Bay.

GASSE, a town of Piedmont, on
miles S. of Chivasso.

GASSENDI, one of the most cele-
Joseph a France has, reduced, was bo-
terter, about 3 miles from Digne in P
1502. When a child, he took delight
at the moon and stars in clear uncloud
This frequently drew him into bye pla-

To make aghast; to fright; to shock

to fear; to affray.—

he saw my best alarmed spirits
the quarrel's right, rous'd to th' en-
counter,

ether galled by the noise I made,

he only he fled.

Shak. K. Lear.

SEIN, a town of Bavaria, in the arch-
diocese of Salzburg, 16 miles SW. of Rad-
sbach S. of Salzburg; famous for its warm
mines of gold, lead, and iron.

SEL, a river of Wales, which runs into
the sea, in Caernarvonshire.

SESTER, a ci-devant bailiwick of Switzer-
land, in the cantons of Schwitz and Glaris.

SESTER, a fort of Africa, in the country
of the Garamantes.

SEPIOSTEUS, the STICKLE-BACK, in
fishery, a genus of fishes belonging to the
Muraenidae. There are 3 rays in the mem-
brane of the gills; the body is carinated; and
some distinct prickles before the back
are 11 species distinguished by the
prickles on the back. One of these,

SEPIOSTEUS ACULEATUS, stickle-back,
or sharpling, is common in many of the
fens. In the fens of Lincolnshire and some
proceed from them, they are found in
quantities. At Spalding, once in 7 or
8 years shoals appear in the Welland,
up the river in form of a vast column,
supposed to be the multitudes that have
drifted out of the fens by the floods of severe
winter collected in some deep hole, till

with numbers, they are periodically
attempt a change of place. The quan-
tity of that they are used to manure the
fields have been made to get oil from
this idea may be conceived of this vast shoal,
that a man being employed by the
to take them, has got for a considerable

SETOIS. See GATINOIS.

SESTRE, a town of Bohemia, in the circle
of Silesia, 8 miles SE. of Leitmeritz.

SESTRE, a town of Turkey, in the Morea,
in the district of Chiarenza.

SELL, Francis, Bp. of Chester, was
appointed preacher to the society
in St. John's Inn, in 1694, and made Bp. of Ches-
ter. He preached a course of sermons
lectures; engaged in the Trinitarian
with Mr Collins and Dr Clarke; and
wrote excellent pieces, intitled, *Christianity*
and A Moral Proof of a Future State. He
was the rights of the university of Oxford
Bp. of Canterbury, in the appoint-
ment of warden of Manchester college; and
violent proceedings against Bp. Atter-
bury of lords, though he disliked the
Whig principles. He died in 1725.

SESTRICK, *adj.* [from *sestren*.] Belong-
ing to a sister.

(2.) **GASTRICK JUICE**, a thin pellucid liquor,
which distils from certain glands in the stomach,
for the dilution, &c. of the food. See **ANATOMY**,
Index.

GASTROCNEMIUS. See **ANATOMY**, § 217.

GASTROMANCY, *n. f.* [from *gaster*, the belly,

GASTROMANTIA, *n. f.* and *mantia*, divination,]
a kind of divination practised among the ancients,
by means of words coming or seeming to come
out of the belly. There is another kind of *gastro-*
mancy, which is performed by means of glasses, or
other round transparent vessels, within which cer-
tain figures appear by magic art. It is thus call-
ed, because the figure appears as in the belly of
the vessels.

(1.) * **GASTRORAPHY**. *n. f.* [from *gaster* and *graphein*.]
In strictness of etymology signifies no more than
sewing up any wound of the belly; yet in com-
mon acceptance it implies, that the wound of
the belly is complicated with another of the in-
testine. *Sharp's Surg.*

(2.) **GASTRORAPHY**. See **SURGERY**, *Index*.

(1.) * **GASTROTOMY**. *n. f.* [from *gaster* and *tomos*.]
The act of cutting open the belly.

(2.) **GASTROTOMY** is also called the **CÆSARIAN**
OPERATION. See **MIDWIFERY**.

* **GAT**. The preterite of *get*.—Moses *gat* him
up into the mount. *Ex. xxiv. 18.*

(1.) **GATA**, a town of Spain, in Estremadura,
85 miles NNW. of Cordova.

(2.) **GATA**, a river of Spain, which rises near
the town (Nº 1.) and runs into the Alagon, 15
miles NNW. of Cordova.

GATAKER, Thomas, a learned critic and di-
vine, born at London, in 1574. He studied at St
John's college, Cambridge, and was afterwards
chosen preacher at Lincoln's Inn; which he quit-
ted in 1611, for the rectory of Rotherhithe. In
1620, he made a tour through the low countries;
and in 1624, published at London a book, entitled,
"Transubstantiation declared by the confession of
the Popish Writers to have no necessary founda-
tion in God's Word." He wrote also a defence of
this discourse. In 1642, he was appointed one of
the assembly of divines, and was engaged with
them in writing annotations upon the Bible. He
died in July 1654, in the 80th year of his age. He
published also, 1. A Dissertation upon the Style of
the New Testament. 2. *De nomine tetragramma-*
ta. 3. *De diphthongis, five bivocalibus*. 4. An Edi-
tion and Translation of Marcus Antoninus's Me-
ditations. 5. A Collection of Sermons, in folio;
and many other works. His piety and charity
were very exemplary; and his modesty was so
great, that he declined all ecclesiastical dignity.
His extensive learning was much admired; his
house was a private seminary, and many foreigners
resorted to him to receive advice in their studies.

(1, i.) * **GATE**. *n. f.* [from *gat*, Saxon.] 1. The
door of a city, castle, palace, or large building.—

Open the *gate* of mercy, gracious God!

My soul flies thro' these wounds to seek thee.

Shaksp.

Gates of monarchs

Are arch'd so high, that giants may jet through,
And keep their impious turbans on, without
Good-morrow to the sun.

Shak. Cymbeline.

L 1 2

2. A

2. A frame of timber upon hinges to give a passage into inclosed grounds.—

Know'st thou the way to Dover?

—Both stile and gate, horseway and footpath.

Shakspeare.

3. An avenue; an opening.—Auria had done nothing but wisely and politically, in setting the Venetians together by the ears with the Turks, and opening a gate for a long war. *Kneller's History of the Turks.*

(II.) GATE, (§ I, i. def. 1.) See ARCHITECTURE. Thebes, in Egypt, was anciently sited the city with a hundred gates. In ancient Rome there was a triumphal gate, *porta triumphalis*. In modern Rome there is the jubilee gate, which is only opened in the year of a grand jubilee. The gates of London were many of them converted into gaols or prisons, as Ludgate, Newgate, &c. but they are now removed. The lesser or bye-gates are called *posterns*. Gates through which coaches &c. are to pass, should not be less than 7 feet broad, nor more than 12; the height, $1\frac{1}{2}$ the breadth.

(II.) GATE, or GAIT, in the manege, called in French *trou*, is used for the going or pace of a horse.

(III.) GATES, in a military sense, are made of strong planks, with iron bars, to oppose an enemy. They are generally made in the middle of the city, from whence they are seen, and defended by the two flanks of the bastions. They should be covered with a good ravelin, that they may not be seen or enfiladed by the enemy. These gates, belonging to a fortified place, are passages through the rampart, which may be shut and opened by means of doors and portcullises. They are either private or public:

1. GATES, PRIVATE, are those passages by which the troops can go out of the town unseen by the enemy, when they pass to and from the relief of the duty in the outworks, or on any other occasion which is to be concealed from the besiegers.

2. GATES, PUBLIC, are those passages through the middle of such curtains, to which the great roads of public ways lead. The dimensions of these are usually about 13 or 14 feet high, and 9 or 10 feet wide, continued through the rampart, with proper recesses for foot passengers to stand in, out of the way of wheel carriages.

(IV.) GATES OF HELL, an expression used in scripture figuratively to denote either the *graves* or the *powers of darkness*, i. e. the devil and his angels. The Mahometans use it literally, and suppose that hell has 7 gates. The first, they pretend, is that where Mussulmans, who incur the guilt of sin, will be tormented; the 2d is for the Christians; the 3d for the Jews; the 4th for the Sabins; the 5th for the Magians or worshippers of fire; the 6th for Pagans and idolaters; and, the 7th for hypocrites, who make an outward show of religion, but have none.

GATEHOUSE, a town of Scotland, in Kirkcudbrightshire, on the mouth of the river Fleet, 13 miles W. of Kirkcudbright. It has 3 regular streets, and carries on a cotton manufacture.

GATES, a county of North Carolina, in Edenton. bounded on the N. by Virginia, and was county. It contained 3173 citizens,

and 3119 slaves, in 1795. Hertford is town.

GATESHEAD, a village of Dursley kind of suburb of Newcastle, though in other county, being divided by the Tyne, which there is a fine stone bridge, with a gate in the middle, having the arms on one side, and those of Newcastle on the other, which is the boundary between the bishopric of Northumberland. The church is a fine building with a very high tower, seen at a great distance. In the church yard are several monuments. There are few traces left of a monastery, except a stone gateway, modern erection. The house covers a great deal of land. Here live the coal pit men.

* GATEVEIN. *n. s.* The vein of a king that loved wealth, he could not have trade sick, nor any obstruction in the *gatevein* which disperseth that *royal's* Henry VIII.

* GATEWAY. *n. s.* [gate and way] through gates of inclosed grounds, between inclosures are so many, that cart between one field and another.

(1.) GATH, or GATH, in ancient times a city of the Philistines, and one of the most famous for having given birth to David made a conquest of it, and it was subject to his successors, till the death of king Rehoboam rebuked it; king Uzziah retook it, and he more reduced it under his subjection. about 5 or 6 miles from Jamnia, about 30 W. of Jerusalem.

authors, among whom is F. Calmet, committed an egregious mistake in making it most southern, and Ekron the most northern of the Philistine cities; as if these had the boundaries of their dominions, when not above 5 miles asunder; and Gath of the five satrapies S. Josephus expresses plainly enough, when he says, it took all the Philistine cities from Gath; there being many more cities of that name in the Hebrew *some press*. of the name of Geth or Gath are Eusebius and St Jerome, whose situation to them, plainly shows them to be different places from this, and from each other. This city recovered its liberty in the time of the prophet Amos and was afterwards demolished by Hazael; since which it became of but little use till the time of the holy war, when of Jerusalem built a castle on its ruins.

(2.) GATH, a town of the tribe of Dan. GATH-EPHER, or GATH-OPHER, a place of the tribe of Dan. Joshua makes this city to be part of Zebulun; and St Jerome, in his commentary on Jonah, says, that it was two miles from otherwise called *Diocefarea*.

(3.) GATH RIMMON, a city belonging to the tribe of Dan. St Jerome places it in the way from Eleuthera given to the Levites of Kohath's family.

TH RIMMON, a city in the tribe of
likewise given to the Kohathites.

TH RIMMON, a city in the half tribe of
on this side Jordan, also given to the

herer. *Wotton*.—To pay the creditor,
him his rent, he must *gather* up money
a. *Locke*. 4. To crop; to pluck.—

What have I done?
my youth, my beauty, and my love
ner gain'd, but slighted and betray'd;
e a rose just *gather'd* from the stalk,
y smelt, and cheaply thrown aside,
her on the ground! *Dryd. Span. Fryar.*
emble.—They have *gathered* themselves
gainst me. *Job*.—All the way we went
e *gathered* some people on both sides,
n a row. *Bacon's New Atlantis*. 6. To
to accumulate.—He that by usury and
n increaseth his substance, shall gather it
at will pity the poor. *Prov.* 7. To se-
ake.—Save us, O Lord, and *gather* us
ng the heathen, to give thanks unto thy
e. *Psf. cvi. 47.* 8. To sweep together.—
dom of heaven is like unto a net that was
be sea, and *gathered* of every kind. *Mat.*
. To collect charitable contributions. 10.
into one body or interest.—I will *gather*
him, besides those that are *gathered* un-
f. *lvi. 8.* 11. To draw together from a
ffusion; to compress; to contract.—

Immortal Tully shone,
oman rostra deck'd the consul's throne;
ing his flowing robe he seem'd to stand,
to speak, and graceful stretch'd his hand.

ain.—

gathers round upon her in the chace;
breathes upon her hair with nearer pace.

Dryden.
ucker needlework. 14. To collect lo-
o know by inference.—That which, out
of reason or of God, men probably *ga-*
be expedient, they make it law. *Hooker.*
reason that I *gather* he is mad,
ad tale he told to day at dinner,
own door being shut against his entrance.

Shak.
e had seen the vision, we endeavoured
to Macedonia, assuredly *gathering* that
had called us. *Acts*.—From this doctrine
creasing and lessening of sin in this re-
may *gather*, that all sins are not alike
d, as the flocks of ancient times, and
powers, have falsely imagined. *Perkins*.—

Return'd

By night, and listening where the hapless pair
Sat in their sad discourse, and various plaint,
Thence *gather'd* his own doom. *Milt. Par. Lqst.*
—Mademoiselle de Scudery, who is as old as a Si-
byl, is translating Chaucer into French; from which
gather that he has formerly been translated into
the old Provençal. *Dryden.* 15. To draw toge-
ther in needlework. 16. To GATHER *Breath*. [A
proverbial expression.] To have respite from any
calamity.—

The luckless lucky maid
A long time with that savage people staid,
To *gather breath*, in many miseries. *Spenser.*
(2.) * To GATHER. *v. n.* 1. To be condensed;
to thicken.—

If ere night the *gath'ring* clouds we fear,
A song will help the beating storm to bear.
Dryden's Pastorals.

When *gath'ring* clouds o'ershadow all the
skies,
And shoot quick lightnings, weigh, my boys!
he cries. *Dryden.*

When the rival winds their quarrel try,
South, East and West, on airy courses born,
The whirlwind *gathers*, and the woods are torn.
Dryden.

Think on the storm that *gathers* o'er your
head,
And threatens every hour to burst upon it.

Addison's Cato.
2. To grow larger by the accretion of similar mat-
ter.—Their snow-ball did not *gather* as it went;
for the people came in to them. *Bacon's Hen. VII.*
3. To assemble.—There be three things that mine
heart feareth; the slander of a city, the *gathering*
together of an unruly multitude, and a false ac-
cusation. *Ecclus. xxvi. 5.* 5. To generate pus or
matter.—Ask one, who by repeated restraints hath
subdued his natural rage, how he likes the change,
and he will tell you 'tis no less happy than the
ease of a broken imposthume after the painful *ga-*
thering and filling of it. *Decay of Piety.*

* GATHER. *n. f.* [from the verb.] Pucker; cloth
drawn together in wrinkles.—

Give laws for pantaloons,
The length of breeches, and the *gathers*,
Part cannons, periwigs and feathers. *Hudib.*

* GATHERER. *n. f.* [from *gather*.] 1. One
that gathers; one that collects; a collector.—I
will spend this preface upon those from whom I
have gathered my knowledge; for I am but a *ga-*
therer and disposer of other men's stuff. *Wotton's*
Preface to Elements of Architecture. 2. One that
gets in a crop of any kind.—I was a herdman and
a *gatherer* of sycamore fruit. *Amos*.—

Nor in that land
Do poisonous herbs deceive the *gatherer's* hand,
May's Virgil.

* GATHERING. *n. f.* [from *gather*.] Collec-
tion of charitable contributions.—Let every one
lay by him in store, that there be no *gatherings*
when I come. *1 Cor. xvi. 2.*

GATINOIS, or GASTINOIS, a ci-devant pro-
vince of France, 45 miles long and 30 broad. In
the 11th century, it had counts of its own, but
was afterwards joined to Anjou. It was next di-
vided

in which there is a nobleness and thought, with a greatness of style, that looked on as the best written book in language at the time.

REL, among builders. See GABLE.

(3.) GAVIL, in law, tribute, toll, custom, or yearly revenue; of which we had in old time several kinds. See GABIEL, N° 1, 2.

(1.) GAVELET, in law, an ancient and special cessavit used in Kent, where the custom of gavel-kind continues, by which the tenant, if he with-draws his rent and services due to the lord, for- seits his land and tenements. The process is thus. The lord is first to seek by the steward of his court, from 3 weeks to 3 weeks, to find some distress upon the tenement, till the 4th court; and if at that time he find none, at this 4th court it is awarded, that he take the tenement in his hand in name of a distress, and keep it a year and a day without manuring; within which time, if the tenant pays his arrears, and make reasonable amends for the with-holding, he shall have and enjoy his tenement as before; if he come not be- fore the year and day be past, the lord is to go to the next county court with witnesses of what had passed at his own court, and pronounce there his process, to have further witnesses; and then by the award of his own court, he shall enter and manure the tenement as his own: so that if the tenant desired afterwards to have and hold it as before, he must agree with the lord; according to this old saying: "Has he not since any thing given, or any thing paid, then let him pay five pound for his were, e'er he become heald again." Other copies have the first part with some varia- tion; "Let him nine times pay, and nine times repay."

(2.) GAVELET is also a writ used in the huf- tings, given to lords of rents in London. Here the parties, tenant and demandant, appear by *fare facias*, to show cause why the one should not have his tenement again on payment of his rent, or the other recover the lands on default thereof.

(3.) * GAVELKIND. *n. f.* [In law.] A custom whereby the lands of the father are equally divided at his death amongst all his sons, or the land of the brother equally divided among the brothers, if he have no issue of his own. This custom is of force in divers places of England, but especially in Kent. *Cowell*.—Among other Welsh customs he a- bolished that of *gavelkind*, whereby the heirs fe- male were utterly excluded, and the bastards did inherit as well as the legitimate, which is the very Irish *gavelkind*. *Davies on Ireland*.

(2.) GAVELKIND is a tenure belonging to lands in the county of Kent, and formerly universal in Ireland. (See ENGLAND, § 42.) The word is said by Lambard to be compounded of three Sax- on words, *gyf, eal, kyn*, "omnibus cognatione pro- ximis data." Versteegan calls it *gavelkind*, quasi "give all kind," that is, to each child his part; and Taylor, in his history of *gavelkind*, derives it from the British *gavel*, i. e. a hold or tenure, and *cenned*, "generatio aut familia;" and so *gavel- cenned* might signify *tenura generationis*.—It is well known what struggles the Kentish men made to preserve their ancient liberties, and with how much success those struggles were attended. And as it is principally here that we meet with the custom of gavel-kind (though it was and is to be found in some other parts of the kingdom), we may conclude, that this was a part of those liber- ties; agreeable to Mr Selden's opinion, that *ga- velkind*

velkind, before the Norman conquest, was the general custom of the realm. The distinguishing properties of this tenure are principally these: 1. The tenant is of age sufficient to alienate his estate by feoffment, at the age of 21. 2. The estate does not escheat in case of an attainder and execution for felony; their maxim being, "the father to the bough, the son to the plough." 3. In most places he had a power of devising lands by will, before the statute for that purpose was made. 4. The lands descend, not to the eldest, youngest, or any one son only, but to all the sons together; which was indeed anciently the most usual course of descent all over England, though in particular places particular customs prevailed; and it must be allowed, that it is founded on strict justice, however contrary to the present general practice.

GAVELKOVON, a town of Lower Bavaria, 30 miles SE. of Landschut.

GAVELLO, a populous town of the Cisalpine republic, in the dep. of Benaco, and ci-devant Veronese; on the road to Ferrara.

GAVEREN, a town of the French republic, in the dep. of the Scheldt, and late prov. of Flanders; seated on the Scheldt, 7 miles from Obent.

GAUERS, a town of Silesia, in the principality of Neisse, 5 miles NNW. of Patzschau.

GAVETA, a town of Naples, in the Capitanzata, 16 miles SSW. of Manfredonia.

GAUGAMELA, in ancient geography, a village of Aturia, lying between the rivers Lycus and Tigris; famous for Alexander's victory over Darius. It is said to have been allowed to Darius Hytaspes for the maintenance of a camel; and hence the name. It was near a more considerable place called *Arbela*; whence the latter gave the name to the victory. See *ARBELA*, § 2.

(1.) * GAUGE. *n. f.* [from the verb.] A measure.—This plate must be a *gauge* to fit your worm and groove to equal breadth by. *Moxon*.—If money were to be hired, as land is, or to be had from the owner himself, it might then be had at the market rate, which would be a constant *gauge* of your trade and wealth. *Locke*.—Timothy proposed to his mistress, that she should entertain no servant that was above four foot seven inches high; and for that purpose had prepared a *gauge*, by which they were to be measured. *Arbutnot's John Bull*.

(2.) GAUGE. See GAGE.

(3.) GAUGE LINE. See GAUGING, § 4.

(4.) GAUGE POINT of a solid measure, the diameter of a circle whose area is equal to the solid content of the same measure.

(1.) * To GAUGE. *v. a.* [*gauge, jauge*, a measuring rod, French. It is pronounced, and often written, *goge*.] 1. To measure with respect to the contents of a vessel. 2. To measure with regard to any proportion.—The vanes nicely *gauged* on each side, broad on one side, and narrow on the other, both which minister to the progressive motion of the bird. *Derham's Phys. Tract.*

It is nothing more particularly admirable in it, than that artful manner in Homer, of taking *gauging* his heroes by each other, and creating the character of one person by comparison of it to some other he is made to

(2.) To GAUGE. See To GAGE.

(1.) * GAUGER. *n. f.* [from *ga* whole business is to measure vessels or —Those earls and dukes have been with royal jurisdiction; and appointed civil officers, as sheriff, admiral, *gaug* cheator. *Carew*.

(2.) A GAUGER, is a king's officer, pointed to examine all tuns, pipes, and barrels, of wine, beer, ale, oil, &c. and give them a mark of allowance, &c. are sold in any place within the extent *five*.

(1.) GAUGING. See GEOMETRY

(2.) GAUGING ROD, an instrument gauging or measuring the contents of That usually employed is the four foot rod. It is commonly made of box, &c. of 4 rules, each a foot long and about of an inch square, joined together by 3 l by which means the rod is rendered when the 4 rules are quite opened, a foot when they are all folded together: first face of this rod, marked 4, are diagonal lines; one for beer and the wine: by means of which the contents of mon vessel in beer or wine gallons readily found by putting the rod in al hole of the vessel till it meets the of the head of the vessel with the flay to the bung hole. For distinction o there is written thereon, *beer* and *w* On the second face, 5, are a line of the gauge line; which is a line expres reas of circles, whose diameters are pondent inches in ale gallons. At the is written *ale area*. On the third fac scales of lines; the first, at the end written *hog'shead*, is for finding how m there are in a hog'shead when it is not with its axis parallel to the horizon, at the end of which is written *B. L.* butt lying, is for the same use as that f head. The 3d line is to find how mu wanting to fill up a butt when it is fl the end of it is written *B. S.* signifying ing. In the half of the 4th face of t rod, 7, there are 3 scales of lines, wants in a firkin, kilderkin, and b: with their areas parallel to the horn are distinguished by the letters, *F. K. I* a *firkin*, *kilder-kin*, and *barrel*.

(3.) GAUGING ROD, USE OF THE LINES ON THE. To find the conten in beer or wine gallons, put the braze gauging rod into the bung hole of the the diagonal lines upwards, and thrust end to the meeting of the head and f with chalk make a mark at the m bung hole of the vessel, and also on t lines of the rod, right against, over o when the brazed end is thrust home and staves: then turn the gauging ro ther end of the vessel, and thrust the home to the end as before. Lastly, mark made on the gauging rod come the mark made on the bung-hole w was thrust to the other end; which i

le on the diagonal lines will, on the show the whole content of the cask in ne gallons. If the mark made on the be not right against that made on the you put it the other way, then right mark made on the bung-hole m be a the diagonal lines; and the division on al line between the two chalks will cefel's whole contents in beer or wine Thus, e. gr. if the diagonal line of a 8 inches four tenths, its contents in s will be near 51, and in wine gallons cefel be open, as a half-barrel, tun, oy d the measure from the middle on one head and staves be 38 inches, the dia gives 122 beer gallons; half of which, the content of the open hal: tub. If large vessel, as a tun or copper, and d line taken by a long rule proves 70 in- content of that vessel may be found y inch at the beginning end of the dia- call ten inches. Thus ten inches be inches; and every tenth of a gallon thons; and every whole call 1000 gal- *impie*. At 44.8 inches on the diagonal s 200 gallons; so that 4 inches 48 parts, 44 inches 8 tenths, is just two tenths e, now called 200 gallons; so also if the e be 76 inches and 7 tenths, a close cask gonial will hold 1000 beer gallons; but an but half so much, viz. 500 beer gallons.

MEASURING ROD, USE OF THE GAUGE THE. To find the content of any cylin- id in ale gallons; seek the diameter of l in inches, and just against it on the is the quantity of ale gallons contained d deep: this multiplied by the length nder will give its content in ale gall ns. Suppose the length of the vessel 32.06, diameter of its base 25 inches; to find e content in ale-gallons? Right against on the gauge-line is one gallon and 745 n; which multiplied by 32.06, the length, 447 gallons for the content of the ves- bung diameter of a hoghead being 25 he head diameter 22 inches, and the 06 inches; to find the quantity of ale ntained in it?—Seek 25. the bung dia- the line of inches; and right against it uge-line you will find 1.745; take one 3d n is .580, and set it down twice: seek 22 the head diameter, and against it you will :gauge-line 1.356; one third of which add- ce .520. gives 1.6096; which multiplied gth 32.06, the product will be 51.603776, nt in ale gallons. Note, this operation that the aforesaid hoghead is in the si- e middle frustrum of a spheroid. The lines on the two other faces of the rod ly; you need only put it downright in- ag-hole (if the vessel you desire to know tity of ale-gallons contained therein be the opposite staves; and then where the the liquor cuts any one of the lines ap- l to that vessel, will be the number of ntained in that vessel.

a town of the Ligurian republic, 25 of Genoa.

. PART. I.

GAVIA, a town of Spain, 4 m. SW. of Granada.
GAUJAC, a town of France, in the dep. of Landes, 12 miles SE. of Dax.

(1.) GAUL, the English translation of GAL- LIA, the ancient name given by the Romans to the country that now forms the republic of France.—The original inhabitants were descend- ed from the Celtes or Gomerians, by whom the greatest part of Europe was peopled; the name of GALLI, or GAULS, being probably given them long after their settlement in that country. See GALLIA.

(2.) GAUL, HISTORY OF, TO ITS FIRST INVA- SION BY THE ROMANS The ancient history of the Gauls is entirely wrapped up in obscurity and darkness; all we know concerning them for a long time is, that they multiplied so fast, that their country being unable to contain them, they pour- ed forth in vast multitudes into other countries, which they generally subdued, and settled in. It often happened, however, that these colonies were so molested by their neighbours, that they were obliged to send for assistance to the mother country. This was always very easily obtained. The Gauls were always ready to send forth great numbers of new adventurers; and as these spread desolation wherever they came, the very name of *Gauls* proved terrible to most of the neighbouring nations.—The earliest excursion of these people, of which we have any distinct account, was into I- taly, under a famed leader, named *Bellovesus*, a- bout A. A. C. 622. He crossed the Rhone and the Alps, till then unattempted; defeated the He- trurians; and seized upon that part of the coun- try, since known by the names of *Lombardy* and *Piedmont*.—The 2d grand expedition was made by the Cœnomani, a people dwelling between the Seine and the Loire, under a general, named *Eistonis*. They settled in those parts of Italy since known by the names of *Brejcians*, *Cremonesi*, *Maniuan*, *Car- niola*, and *Venetia*; now included in the Cisalpine republic and Maritime Austria. In a 3d excur- sion, 2 other Gaulish nations settled on both sides of the Po; and in a 4th the Boii and Lingones set- tled in the country between Ravenna and Bologna. The time of these 3 last expeditions is uncertain. The 5th expedition of the Gauls was more re- markable than any of the former, and happened about 200 years after that of Bellovesus. The Se- nones, settled between Paris and Meaux, were in- vited into Italy by an Etrurian lord, and settled themselves in Umbria. Brennus their king laid siege to Clusium, a city in alliance with Rome; and this produced a war with the Romans, in which the latter were at first defeated, and their city taken and burnt; but at length the whole ar- my of the Gauls was cut off by CAMILLUS, inso- much that not a single person escaped. The Gauls after this undertook some other expeditions against the Romans: in which, though they al- ways proved unsuccessful, by reason of their want of military discipline; yet their fierceness and courage made them so formidable to the re- public, that, on the first news of their march, ex- traordinary levies of troops were made, sacrifices and public supplications offered to the gods, and the law which granted an immunity from military service to priests and old men, was, for a time, abo- lished. Against the Greeks, the expedition of the

it was very little more successful than against the Romans. The first of these we hear of was about A. A. C. 279, the year after Pyrrhus had invaded Italy. At this time, the Gauls, finding themselves greatly overstocked with inhabitants at home, sent out 3 great colonies to conquer new countries. One of these armies was commanded by Brennus another by Cerethrius, and the 3d by Belgius. The first entered Panonia or Hungary; the second Thrace; and the 3d marched into Illyricum and Macedonia. Here Belgius at first met with great success; and enriched himself by plunder to such a degree, that Brennus, envying him, resolved to enter the same countries, in order to share the spoil. In a short time, however, Belgius met with such a total defeat, that his army was almost entirely destroyed; upon which Brennus hastened to the same place. His army at first consisted of 150,000 foot and 15,000 horse; but two of his principal officers revolted, and carried off 20,000 men, with whom they marched into Thrace; where, having joined Cerethrius, they stood on Byzantium and the western coast of Propontis, making the adjacent parts tributary to them.—To retrieve this loss, Brennus sent for fresh supplies from Gaul; and having increased his army to 150,000 foot, and upwards of 60,000 horse, he entered Macedonia, defeated the general who opposed him, and ravaged the whole country. He next marched towards the straits of Thermopylae, to invade Greece; but was stopped by the forces sent to defend that pass against him. He passed the mountains, however, as Xerxes had formerly done; upon which the guards retired, to avoid being surrounded. Brennus then having ordered Acichorius, the next to him in command, to follow at a distance with part of his army, marched with the bulk of the forces to Delphi, in order to plunder the rich temple there. This enterprise proved very unfortunate: a great number of his men were destroyed by a dreadful storm of hail, thunder, and lightning; another part of his army was destroyed by an earthquake; and the remainder, imagining themselves attacked by the enemy, fought against each other the whole night, so that in the morning scarce one half of them remained. The Greek forces then poured in upon them from all parts; and that in such numbers, that though Acichorius came up in due time with his forces, Brennus found himself unable to make head against the Greeks, and was defeated with great slaughter. He himself was desperately wounded; and so disheartened by his misfortunes, that, having assembled all his chiefs, he advised them to kill all the wounded and disabled, and to make the best retreat they could; after which he put an end to his own life. On this occasion it is said, that 20,000 of these unhappy people were executed by their own countrymen. Acichorius then set out with the remainder for Gaul; but, being obliged to march through the country of their enemies, the calamities they met with by the way were so grievous, that not one of them reached their own country. A just

story say the Greek and Roman authors, for various intentions against Delphi. The Gauls often felt the effects of the Gauls' outrage, thought proper at last,

in order to humble them, to invade them. Their first successful attempt was about 118, under Quintus Marcius Rex. He way betwixt the Alps and the Pyrene laid the foundation for conquering that country. This was a work of immense itself and rendered still more difficult by the position of the Gauls, especially those Stani, who lived at the foot of the Alps people finding themselves overpowered by the Romans, set fire to their houses, killed the men and children, and then threw themselves flames. After this Marcius built Narbonne became the capital of a province.

(1.) GAUL, HISTORY OF, TO ITS SUBJUGATION BY CÆSAR. Scarcely, the first Marcius, also conquered some Gaulish and to facilitate the sending troops from to that country, he made several excursions between them, which before were almost insupportable. These successes gave rise to the the Cimbri and Teutones. See CIMBRI TEUTONES, &c. From this time, Gaul ceased to be formidable to the Romans, seem to have been for some time on good terms with them. At last, however, the Helles led a war with the republic, which broke far over the Alps, and ended in the total ruin of the country. Orgetorix was the author of it; who had engaged a vast number of countrymen to burn their towns and villages to go in search of new conquests. Julius to whose lot the whole country of Gaul fell, made such haste to come and suppress that he got to the Rhone in 8 days; crossed the bridge of Geneva, and, in a few days finished the famed wall between that mount Jura, now St Claude, which extends miles in length, was 16 feet high, fortified with towers and castles at proper distances, and that ran the whole length of it. According to his own account, he did not set out till the 1st of April; and yet this huge work was finished the 13th of the month: so that, during the 8 days he was a-camping, it must all be done in about 5 days; a prodigious undertaking he had but one legion there though the whole country had given assistance. Whilst this was doing, and the Gauls he wanted were coming, he sent Helvetii, who had sent to demand a passage into the country of the Allobroges, till he had received reinforcements; and then flatly refused them; whereupon a dreadful battle ensued; they lost 130,000 men, in spite of all the besides a number of prisoners, among which was the wife and daughter of Orgetorix, the author of this unfortunate expedition. The rest fled and begged they might be permitted to settle among the Aedui, from whom they had lately sprung; and, at the request of the Aedui, they were permitted to go. The Gauls constantly in a state of variance with one another, and Cæsar, who knew how to make the most of these intestine broils, soon became the umpire of all their contentions. An Gaul who applied to him for help, were his

against whom Ariovistus, king of the Ger-
 joined with the Averni, who inhabited the
 of the Loire, had taken the country of the
 from them, and obliged them to send
 to him. Cæsar forthwith sent to demand
 titution of both, and, in an interview which
 n after obtained with that haughty and
 rous prince, had almost fallen a sacrifice to
 fity; upon which he bent his whole pow-
 st him, forced him out of his strong in-
 nents, and gave him a total overthrow. A-
 s escaped, with difficulty, over the Rhine;
 two wives, and a daughter, with a great
 of Germans of distinction, fell into the
 r's hand: Cæsar, after this signal victo-
 his army into winter quarters, whilst he
 ver the Alps to make the necessary prepa-
 for the next campaign. By this time all
 æ in general were so terrified at his suc-
 at they entered into a confederacy against
 nans as their common enemy. Of this,
 s, who had been left in Gaul, sent Cæsar
 upon which he immediately left Rome,
 le such dispatch, that he arrived upon their
 in about 15 days. On his arrival, the
 submitted to him; but the rest, appoint-
 ha king of the Sueffones, general of all
 rces, which amounted to 150,000 men,
 l directly against him. Cæsar, who had
 n the bridge of the Axona, (now AISNE,)
 ight horse and infantry over it; and whilst
 rs were encumbered in crossing that river,
 ch terrible slaughter of them, that the ri-
 filled with their dead, insomuch that their
 eaved for a bridge to those who escaped.
 victory struck such terror into the rest,
 y dispersed themselves; immediately after
 the Sueffones, Bellovaci, Ambiones, and
 hers, submitted to him. The Nervii, in-
 imed with the Atrebatæ and Veromandui
 them; and having first secured their wives
 dren, made a vigorous resistance for some
 ut were at length defeated, and the great-
 of them slain. The rest, with their wives
 men, surrendered, and were allowed to
 their own cities and towns as formerly.
 uatici were next subdued; and, for their
 y, were sold for slaves, to the number of
 Young Crassus, the son of the triumvir,
 also 7 other nations, and took possession of
 ies; which not only completed the con-
 the Belgæ, but brought several nations
 yond the Rhine to submit. The Veneti,
 nt inhabitants of Vannes in Brittany, who
 n likewise obliged to send hostages to the
 or, in the mean time, made great prepa-
 y sea and land to recover their liberty.
 then in Illyricum, equipped a fleet on the
 and having given the command of it to
 went and defeated them by land, as Bru-
 y sea; and having put their chief men to
 old the rest for slaves. The Unelli, with
 x their chief, together with the Lexovii
 ercii, were about the same time subdued
 us, and the Aquitani by Crassus, with
 of 30,000 men. There remained nothing
 countries of the Morini and Menapii to be

conquered of all Gaul. Cæsar marched against
 them, but found them so well intrenched in their
 inaccessible fortresses, that he contented himself
 with burning and ravaging their country; and ha-
 ving put his troops in winter quarters, he again
 passed over the Alps, to have a more watchful
 eye on some of his rivals there. He was, howe-
 ver, soon after obliged to defend his Gaulish con-
 quests against a body of Germans, who were at-
 tempting to settle there, to the number of 400,000.
 These he totally defeated, and then resolved to
 carry his conquering arms into Germany. See
 GERMANY.

(4.) GAUL, HISTORY OF, TO ITS TOTAL CON-
 QUEST BY CÆSAR. Cæsar, upon his return into
 Gaul, found it labouring under a great famine,
 which had caused a kind of universal revolt. Cot-
 ta and Sabinus, who were left in the country of
 the Eburones, (now LIÈGE,) were betrayed into
 an ambush by Ambiorix, one of the Gaulish chiefs,
 and had most of their men cut off. The Adu-
 atici had fallen upon Q. Cicero, who was left
 there with one legion, and had reduced him to
 great straits: while Labienus, with his legion, was
 attacked by Indutiomarus, at the head of the
 Rhemi and Senones; but by one bold sally, he put
 them to flight, and killed their general. Cæsar
 acquired no small credit by quelling all these re-
 volts; but each victory cost so many of his troops,
 that he was forced to have recourse to Pompey
 for a fresh supply, who readily granted him two
 of his own legions to secure his Gaulish conquests.
 But the Gauls, ever restless under a foreign yoke,
 raised up a new revolt, and obliged him to return.
 His fear lest Pompey should gain the affections of
 the Roman people, had obliged him to strip the
 Gauls of their gold and silver, to bribe them over
 to his interest; and this was no small cause of
 those frequent revolts which happened during his
 absence. He quickly, however, reduced the Nervii,
 Aduatici, Menapii, and Treviri; the last of whom
 had raised the revolt under the command of Ambio-
 rix: but he found the flame spread much farther, e-
 ven to the greatest part of the Gauls, who had cho-
 sen Vercingetorix their generalissimo. Cæsar was
 forced to leave Insubria, whither he had retired to
 watch the motions of Pompey, and, in the midst
 of winter, to repass the Alps into the province of
 Narbonne. Here he gathered his scattered troops
 with all possible speed; and, in spite of the hard
 weather, besieged and took Noviodunum, (now
 NOYONS;) and defeated Vercingetorix, who was
 come to its relief. He next took the city of Avo-
 ricum, (now BOURGES,) one of the strongest in
 Gaul, and which had a garrison of 40,000 men:
 of whom he made such a dreadful slaughter, that
 hardly 800 escaped. Whilst he was besieging
 Gergovia, the capital of the Arverni, he was in-
 formed that the Nitobriges, (or *Agennis*;) were in
 arms; and that the Ædui were sending to Vercin-
 getorix 10,000 men, whom they were to have sent
 to reinforce Cæsar. Upon this news, he left Fabius
 to carry on the siege, and marched against the Ædui.
 These, upon his approach, submitted, in appear-
 ance, and were pardoned; but soon after that
 whole nation rose, and murdered all the Italian
 troops in their capital. Cæsar, on this, resolved

to raise the siege of Gergovia, and at once attack the enemy's camp, which he did with some success; but when he thought to have gone to Noviodunum, where his baggage, military chest, &c. were left, he heard that the Ædui had carried the chest, and burnt the place. Labienus, justly thinking that Cæsar would need his assistance in the condition he now was, went to join him, and in his way defeated a Gaulish general, named *Camulogenus*, who came to oppose his march: but this did not hinder the revolt from spreading all over Celtic Gaul, where Vercingetorix had sent for fresh supplies, and in the mean time, attacked Cæsar; but was defeated, and forced to retire to Alesia, a strong place, now called Alesia. Hither Cæsar followed, and besieged him; and, having drawn a double circumvallation, with a view to starve him out, as he was likely to have done, resisted all offers of a surrender from him. At length, the long expected reinforcement came, consisting of 16,000 men, under 4 generals, who made several fruitless attacks on Cæsar's trenches; but were defeated in 3 several battles, which at length obliged Vercingetorix to surrender at discretion. Cæsar treated all his prisoners with great severity, except the Ædui and Arverni, by whose means he hoped to gain their nations, which were the most potent of Celtic Gaul: nor was he disappointed; for both of them submitted to him, and the former renewed him to their capital, where he spent the winter, after putting his army into winter quarters. This campaign being one of the hardest he had ever made, so he gained more glory by it than any Roman general had done before: yet he could not procure from the ferule senate, now wholly devoted to his rival, a prolongation of his consulship; upon which he is reported to have laid his hand upon his sword, and said, that *that* should do it. He was as good as his word; and the Gauls, upon their former ill success, resolving to have as many separate armies as provinces, in order to embarrass him the more, Cæsar, and his generals Labienus and Fabius, were forced to fight them one after another; which they did, however, with such success, that, notwithstanding the hardness of the season, they subdued the Biturges, Carnuti, Rhemi, and Bellovaci, with their general Corbicus; by which he at once quieted all the Belgic provinces bordering on Celtic Gaul. The next who followed were the Treveri, the Eburones, and the Sudes, under their general Dunmarus. The last place which held out against him was Uxellodunum; which was defended by the two last acting generals of the Gauls, Drapes, the Senonian, and Luterius, the Cadurcean. The place being strong and well garrisoned, Cæsar was obliged to march thither from the farthest part of Belgic Gaul; and soon after reduced it, for want of water. Here again he cauled the right heads of all that were fit to bear arms to be cut off, to deter the rest from revolting afresh. Thus was the conquest of Gaul finished from the Alps and Pyrenees to the Rhine, all which vast tract was now reduced to a Roman province under the government of a prætor. During his several expeditions into Gaul, Cæsar is said to have

taken 800,000; to have subdued 30 nations; and to have left to the few that were left, three millions of men, of whom one million were killed, and a million taken prisoner;—of the conquest, see the time of the Roman conquest of Gaul, and the time of the Roman conquest of Gaul.

GALLIAN. See GALLIEN.

GALLI NITI, or GALLI NITIS, a part of India to the S. bordering on Gaul. It was divided into

1. GALLI NITIS INTERIOR, which lake of Gergovia, and

2. GALLI NITIS SUPERIOR, which to Arden.

GALLMIN, Gilbert, a French man in 1641. He wrote poems and epics were much admired in his own time, but little of his. He died in 1660.

GALLON, or GOLLAN, the capital of a county, a large city or town.

GALLON, the people of GALLON, a town in the county of Devon, in the N. of the city of Exeter, with a market on Monday; or a town in the county of Devon, now called miles W. of Exeter.

GALLON, a town in the county of Devon.

GALLS, the ancient inhabitants of Gaul, p. 1-4. The Gauls were divided into a great number of tribes, who were continually at war with one another, and at variance among themselves. They were, that not only all their cities, castles, towns, but almost all their families, were divided by factions; and this undoubtedly facilitated the conquest of the whole. The character of all these people was an excess of liberty, even to ferocity. Thus they such an extreme, that either on the appearance of a new army, or in aspect of action through wounds, or extreme diseases, they put their own lives, or prevailed upon their kinsmen. The Gauls, when they found so firmly believed that they could be conquered, stood of thinking how to obtain a more capitation, therefore they was to put their wives and children to death to kill one another, to avoid slavery. Their excessive love of liberty, tempt of death, according to Strabo, facilitated their conquest by Cæsar; and their numerous forces upon such an enemy as Cæsar, their want of conduct proved the ruin of the whole. Their nation was hunting; and indeed, covered forests with which their country and the multitude of wild beasts, who in them, they were under an absolute necessity to hunt and destroy them, to prevent them from being rendered totally unusable. Besides this, however, they had also the dromes, horse and chariot races, tilts, &c. at all of which the bards, at their poems, songs, and musical instruments. For an account of their religion, see DAVID. The Gauls were excessive

which they were very profuse; as, northern nations, they were great eaters and drinking. Their chief beer and wine. Their tables were heavy eat but little bread, which was hard, and easily broken in pieces: a great deal of flesh, boiled, roasted, and this they did in a very slovenly ling the piece in their hands, and with their teeth. What they could not eat, they cut with a little knife or dink, at their girdles. When the company was, the *Coryphæe*, or chief of the feast, or one of the richest, noblest, or bravest in the middle, with the master of the fide; the rest took their places next their rank, having their servants hold- ing behind them. These feasts seldom at bloodshed; but if the feast proved was generally accompanied not only with songs, but with dances, in which were armed cap-a-pee, and beat time with swords upon their shields. On certain days, dressed themselves in the skins of lions, that attire accompanied the proce- sion of their deities or heroes. Others dressed themselves in masquerade habits, some of which were decent, and played several antic and ridiculous tricks. This last custom continued until their conversion to Christianity.

GAUNT, a town of France, in the department of Cher, 8 miles N. of Montdoubleau. **GAURIA**, in botany, a genus of the order, belonging to the decandria class and in the natural method ranking under the 17th order, *Bicornes*. The exterior calyx is five-lobed, the interior quinquefid; the corolla is tubular, the nectarium consists of ten tubulated capsules, each capsule is quinquelocular, covered with a thick exterior calyx formed in the shape of a

GAUSDORFF, a town of Austria, 9 m. S. of Gmünd, and 16 NNE. of Vienna.

GAUSE, a river in Durham, which runs into the sea, at Bishop's Auckland.

GAUNT. *adj.* [As if *gewant*, from *gepan*, Sax.] Thin; slender; lean; mea-

now that name befits my composition! I am, indeed, and *gaunt* in being old: my grief hath kept a tedious fast; I abstain from meat that is not *gaunt*? I have long time have I watch'd; I have bred leanness, leanness is all *gaunt*: I am sure that some fathers feed upon fast; I mean my childrens looks; I am fasting thou hast made me *gaunt*: I am for the grave, *gaunt* as a grave, my hollow womb inherits nought but bones.

Shak. Richard II.

GAUNT, *adj.* stiff, *gaunt* and grim, her slight pursu'd, her fasten'd fangs in blood embro'd.

Dryden's Fables.

GAUNT, in geography. See **GHAENT**.

GAULIED, *adj.* in the manege, a term for a horse whose belly shrinks up towards the back.

GAUNTLET. *n. f.* [*gantelet*, French.]

An iron glove used for defence, and thrown down in challenges. It is sometimes in poetry used for the *cestus*, or boxing glove.—

A scaly *gauntlet* now, with joints of steel,
Must glove this hand. *Shak. Henry IV.*

Feel but the difference, soft and rough;
This a *gauntlet*, that a muff. *Cleaveland.*

Some shall in swiftness for the goal contend,
And others try the twanging bow to bend;
The strong with iron *gauntlets* arm'd shall stand,
Oppos'd in combat, on the yellow sand. *Dryd.*

Who naked wrestled best, besmear'd with oil;
Or who with *gauntlets* gave or took the foil.

Dryden's Fables.

The funeral of some valiant knight
May give this thing its proper light:
View his two *gauntlets*; these declare
That both his hands were us'd to war. *Prior.*

So to repel the Vandals off the stage,
Our vet'ran bard resumes his tragick rage;
He throws the *gauntlet* Otway us'd to wield,
And calls for Englishmen to judge the field.

Southern.

(2.) **THE GAUNTLET**, [from *gant* or *gant*, Fr. a glove] in chivalry, was worn by cavaliers when armed at all points. The fingers were covered with small plates. The calque and gauntlets were always born in the ancient marches. They were introduced about the 12th or 13th century.

(3.) **GAUNTLET**. } See **GANTELOPE**.
GAUNTLOPE. }

* **GAUNTLY**. *adv.* [from *gaunt*,] Leanly; slenderly; meagerly.

(1.) * **GAVOT**. *n. f.* [*gavotte*, French.] A kind of dance.—The disposition in a fiddle to play tunes in preludes, sarabands, jigs and *gavots*, are real qualities in the instrument. *Mart. Scriblerus.*

(2.) **GAVOT**, } or **GAVOTTE**, is a kind of
GAVOTTA, } dance, the air of which has two
brisk and lively strains in common time, each of which is twice played over. The first has usually 4 or 8 bars; and the 2d contains 8, 12, or more. The first begins with a minim, or two crotchets, or notes of equal value, and the hand rising; and ends with the fall of the hand upon the dominant or mediant of the mode, but never upon the final, unless it be a rondeau: and the last begins with the rise of the hand, and ends with the fall upon the final of the mode.

(3.) **GAVOTTA**, **TEMPI DI**, is when only the time or movement of a *gavotte* is imitated, without any regard to the measure or number of bars or strains.—Little airs are often found in sonatas, which have this phrase to regulate their motions.

(1.) **GAUR**, a country of Asia, between Balk and Candahar.

(2.) **GAUR**, the capital of the above country, 152 miles NNW. of Candahar, and 150 E. of Herat.

(1.) **GAURA**, in botany, *Virginian Loose-strife*, a genus of the monogynia order, belonging to the octandria class of plants; and in the natural method ranking under the 17th order, *Calycanthemæ*. The calyx is quadrifid and tubular; the corolla pentapetalous, with the petals rising upwards. The nut is inferior, monospermous, and quadrangular.

(2.) **GAURA**, in geography, a town of Peru, in the prov. of Chançay, containing 200 houses and 2 churches. Its chief trade is in beef and salt.

(3.) **GAURA**,

(1.) GAURÁ, a river of Peru, in Chanay.

GAURABAD. See GABRES, N° 1.

GAVRAY, a town of France, in the dep of the Channel, 13 miles N. of Avranches, and 3 S. of Coutances.

GAVRES, } or GABRES. See GABRES, N° 1.

GAURS, }
GAUSE. See GAUZE.

The GAUTS or INDIAN APPENINES, a stupendous wall of mountains, extending from Cape Comorin, the S. extremity of the peninsula of Indostan, to the Tapti, or Surat river, at unequal distances from the coast; held on more than 60 miles, commonly about 40, and in one part it approaches within 6 miles. They rise abruptly from the country of Concan, supporting, in the nature of a terrace, a vast extent of fertile and populous plains, which are so elevated as to render the air cool and pleasant. The height is supposed to be from 3000 to 4000 feet. This celebrated ridge does not terminate in a point, when it approaches the Tapti; but, departing from its meridional course, it bends eastward, in a wavy line, parallel to the river; and is afterwards lost among the hills, in the neighbourhood of Burrhanpou. In its course along the Tapti, it forms several passes or descents, whence the name *Gauts*, (which means a *landing place*) towards that river. The alternate N.E. and S.W. winds, called *Monsoons*, occasion a rainy season only on one side, viz. on the windward side of these mountains. See BALAGATE, N° 2.

(1.) GAUZE, *n. f.* A kind of thin transparent silk.—Silken cloaths were used by the ladies; and it seems they were thin, like *gauze*. *Arab. on Coms.*

Brocades and damasks, and tabbies and *gauzes*, are lately brought over. *Savist.*

(2.) GAUZE, GAUSE, or GAWSE, in commerce, is woven sometimes of silk, and sometimes only of thread. To warp the silk for making gauze, they use a peculiar kind of mill, upon which the silk is wound: this mill is a wooden machine about 6 feet high, having an axis perpendicularly placed in the middle thereof, with 6 large wings, on which the silk is wound from off the bobbins by the axis turning round. When all the silk is on the mill, they use another instrument to wind it off again on two beams: this done, the silk is passed through as many little beads as there are threads of silk; and thus rolled on another beam to supply the loom. There are figured gauze; some with flowers of gold and silver, on a silk ground: these last are chiefly brought from China.

(3.) The GAUZE LOOM resembles the common loom, but has several appendages peculiar to it. See LOOM.

GAWILE. See GVALGUR.

* GAWK. *n. f.* [*geac* Saxon.] 1. A cuckoo.
2. A foolish fellow. In both senses it is retained in Scotland.

* GAWN. *n. f.* [corrupted for *gallon*.] A small tub, or lading vessel. A provincial word.

GAWNAGH, LOUGH, a lake of Ireland in Longford, 15 miles N.E. of Longford.

* GAWN TREE. *n. f.* [Scottish.] A wooden frame on which beer casks are set when turned.

GAWRAH, a river of Indostan.

GAY, John, a celebrated English poet,

descended from an ancient family. He was born at Exeter, and educated at Barnstaple, under Mr Ray, bred a mercer, but having a small consideration for the attendance on a shoemaker of his talents, he resolved on an inclination for the Muses. In 1711 secretary to the duchess of Monmouth he accompanied the earl of Clarendon. On Q. Anne's death, he returned to his land, where he lived in the highest friendship with many persons of distinction. He was particularly taken with Caroline, then princess of Wales, read in MS. his tragedy of the *Cop* 1726 dedicated his *Fables*, by permission of the duke of Cumberland. From this shown to him, and numberless profertment, it was supposed, that he would gently provided for in some office inclination and abilities. But in 1727, he was offered the place of gentleman to one of the youngest princesses. this as rather an indignity to a man he thought proper to refuse it; and warm remonstrances were made on by his sincere friends and patrons duchess of Queensberry, who withdrew in disgust. Mr Gay's dependence on the promise of the great, he had and humorously described in his *Hare with many friends*. The profits he lost in 1720, in the S. Sea scheme very extraordinary encouragement from the public loan made ample am private disappointments. For, in 1721 he appeared his *Beggar's Opera*; the which was not only unprecedentedly incredible. It had an uninterrupted don for 63 nights in the first season, renewed in the ensuing one with equal It spread into all the great towns of E acted in many places 30 and 40 1 Bath and Bristol 50; made its progress Scotland, and Ireland, in which last acted for 24 successive nights; and was performed at Minorca. Nor confined to the reading and representation the card table and drawing-room of the theatre and closet; the ladies its favourite songs engraven upon its screens and other pieces of furniture rated with them. It short, the faure was so striking, and so perfectly ad taste of all ranks that it overthrew the that *Dagon* of the nobility and gentry had so long idolized, and which Den other writers had in vain, by the so alone, endeavouring to drive from the public taste. The profits were so ver to the author and Mr Rich the mai gave rise to a popular pun, viz. *Tba* RICH gay, and GAY rich. In conteq success, Mr Gay was induced to wr to it, which he entitled *Polly*. But th listing between him and the court, t the report of his having wrote sedition occasioned a prohibition of it to be

certain, at the time when every thing shines for the rehearsal. A very common, however, accrued to him from the of it afterwards in 4to. He wrote several dramatic pieces, and many valuable. Among the latter, his *Trivia*, or *walking the streets of London*, though poetical attempt, recommended him to the friendship of Mr Pope: but as, in dramatic works, his *Beggar's Opera* ever stand as an unrivalled masterpiece, his poetical works, his *Fables* hold the of estimation. Mr Gay's disposition and affable, his temper generous, and his conversation agreeable. But he had one foible, a propensity to men of great literary abilities in excess of indolence, without any industry. So that, though his emoluments were, in the periods of his life, very considerable, he was ever greatly straitened in his circumstances; could he prevail on himself to follow the advice of his friend Dean Swift, who endeavoured to persuade him to purchase an annuity, for the exigencies of old age. Mr Gay, after having undergone many vicissitudes of fortune, and being for some time supported by the duke and duchess of York, died at their house in Burlington Street, Dec. 1732. He was interred in Westminster Abbey, and a monument erected to his memory at their expence; with an inscription of his merits, and an epitaph in verse.

Gay. *adj.* [*gay*, French.] 1. Airy; cheerful; frolick.—

How flow the waves, the zephyrs gently
Sail'd, and all the world was gay. *Pope.*

My rival wits did Voiture's fate deplore,
My gay mourn'd, who never mourn'd before.

Pope.

Howy.—

in that loves to go gay. *Bar. vi. 9.*

Gay. *n. s.* [from the adjective.] An ornament or embellishment.—Morose and untractable look upon precepts in emblem, as on *gays* and pictures, the fooleries of a d wiles tales. *L'Esrange.*

A town of Moravia, in Hardisch.

A, a town of Spain in Valencia, 30 miles from Valencia.

GAYETY. *n. s.* [*gayeté*, French; from *gay*.] 1. Cheerfulness; airiness; merriment. 2. Acts of pleasure.—

From those gayeties our youth requires
To life their minds, our age retires. *Denb.*

Howy.—

My eyes and our guilt are all besmirch'd,
My marching in the painful field.

Shak. Henry V.

GAZ, a peninsula of Massachusetts, on Martha's Vineyard, 3½ miles long and 1½ wide. It has evident marks of 4 or 5 old volcanoes of them called the *Devil's Den*, is covered with grass, and is 20 roads over at top, yet high at the sides. Lon. 70. 50. W. Lat. 42. N.

Gay. *adv.* 1. Merrily; cheerfully; airily;

2. Splendidly; pompously; with great show.

The ladies, *gayly* dress'd, the Mall adorn
With curlous dies, and paint the sunny morn;

Gay.

Like some fair flow'r, that early Spring supplies,
That *gayly* blooms, but ev'n in blooming dies,

Pope.

* **GAYNESS.** *n. s.* [from *gay*.] Gayety; merriment. Not much in use.

GAYOT DE PETAVAL, Francis, a French writer of the 18th century, born in 1673. He published an interesting work, entitled *Causes Celebres*, in 20 vols. 12mo. and died in 1743, aged 70.

(1.) **GAZA,** Theodore, a famous Greek in the 15th century, born in Thessalonica, in 1398. His country being invaded by the Turks, he retired into Italy; where he at first supported himself by transcribing ancient authors. His uncommon parts and learning soon recommended him to public notice. In 1450, he was invited to Rome by Pope Nicholas V; and on his death, in 1456, to Naples, by king Alphonso: who dying in 1458, he returned to Rome, where cardinal Bessarion procured him a benefice in Calabria. He was one of those to whom the revival of learning in Italy was principally owing. He translated from the Greek into Latin, Aristotle's *History of Animals*, Theophrastus on plants, and Hippocrates's *Aphorisms*; and put into Greek, Scipio's *Dream*, and Cicero's *Treatise on Old Age*. He wrote a *Grammar* and several other works in Greek and Latin; and died at Rome in 1478, aged 80.

(2.) **GAZA,** in ancient geography, a principal city and one of the five satrapies of the Philistines. It was situated about 100 stadia from the Mediterranean, on an artificial mount, and strongly walled round. It was destroyed by Alexander the Great, and afterwards by Antiochus. In the time of the Maccabees it was a strong and flourishing city; but was destroyed a 3d time by Alexander Jannæus. At present it contains only about 2000 inhabitants. The buildings are mean, both as to the form and matter. Some remains of its ancient grandeur appear in the handsome pillars of Parian marble which support some of the roofs; while others are disposed of here and there, in different parts of almost every beggarly cottage. On the top of the hill, at the N.E. corner of the town, are the ruins of large arches sunk low into the earth, and other foundations of a stately building, whence some of the bashaws have carried off marble pillars of an incredible size. Soap and cotton cloths are the chief manufactures. The latter employs 500 looms. Gaza is the residence of a Turkish bashaw. It was taken by the French under Gen. Kleber in Feb. 1799. It lies 50 miles S.W. of Jerusalem. Lon. 34. 45. E. Lat. 31. 28. N.

(3.) **GAZA, NEW,** a sea port of GAZA, N° 2.

* **GAZE.** *n. s.* [from the verb.] 1. Intent regard; look of eagerness or wonder; fixed look.—

Being lighten'd with her beauty's beam,
And thereby fill'd with happy influence,

And lifted up above the world's gaze,
To sing with angels her immortal praise. *Spens.*

Do but note a wild and wanton herd,

If any air of musick touch their ears,

You shall perceive them make a mutual stand,

Their

Then savage eyes turn'd to a modest gaze,
By the sweet power of musick. *Shak.*

Not a month
Wore your queen dy'd, she was more worth
such gazers

Thou what you look on now. *Shak. Wint. Tale.*

With secret gaze,
Or open admiration, him behold,
On whom the great Creator hath bestow'd
Worlds. *Milton's Paradise Lost.*

—Pindar is a dark writer, wants connexion, as to our understanding, soars out of sight, and leaves his readers at a gaze. *Dryd.*—After having stood at gaze before this gate, he discovered an inscription. *Addison's Freeholder.* 2. The object gazed on.—

I must die
Betray'd, captiv'd, and both my eyes put out;
Made of my enemies the scorn and gaze;
To grind in brazen fetters, under task,
With my heav'n gifted strength. *Milton's Agon.*

(1.) * To GAZE [*gazeō*, or rather *geseon*, to see, Sax.] To look intently and earnestly; to look with eagerness.—

What seest thou there? King Henry's diadem,
Inchast'd with all the honours of the world:
If so, gaze on. *Shak. Henry IV.*

From thence she cast her modest eyes below;
At some her gazing glances riving flew. *Fairf.*
—Gaze not on a mud, that thou fall not by little things that are precious in her. *Ecclef. ix. 5.*

A lover's eyes will gaze an eagle blind. *Shak.*
High stations tumults, not not bliss create;
None think the great unhappy, but the great
Fools gaze and envy; Envy darts a sting,
Which makes a swain as wretched as a king.

Young.
(2.) * To GAZE. *v. a.* To view stedfastly —
Strait toward heav'n my wond'ring eyes I
turn'd,

And gaz'd a while the ample sky. *Milton.*
* GAZEFUL. *adj.* [*gaze* and *full*.] Looking intently.—

The brightness of her beauty clear,
The ravish'd hearts of gaze-ful men might rear
To admiration of that heavenly light.

Spenser on Beauty.
(1.) * GAZE-HOUND. *n. f.* [*gaze* and *bound*; *canis gazeus*, *Skinner.*] A hound that pursues not by the scent, but by the eye.—

See'st thou the gazebound! how with glance
severe
From the close herd he marks the destin'd deer!

Tuckel.
(2.) GAZE-HOUNDS, or GAST-HOUNDS, are much used in the north of England; they are fitter in an open champaign country than in bushy and woody places. If a well-taught gaze hound takes a wrong way, he will return upon a signal and begin the chase afresh. He is also excellent at spying out the fattest of a herd; and having separated it from the rest, will never give over the pursuit till he has worried it to death.

(1.) * GAZEL. *n. f.* An Arabian deer.

(2.) GAZEL, or } in zoology. See CAPRA, §
GAZELLA, } VII, N° 4; and § VIII.

* GAZER. *n. f.* [from *gaze*.] He that gazes;

one that looks intently with eagerness.

In her cheeks the verm' red did
Like roses in a bud of lilies shed;
The which ambrosial odours from
And gazers lend with double pleas

I'll Ray more gazers than the bat
Bright as the sun, her eyes the ga

He had been lately

RT I.

joined by 3 Turkish commanders, each of whom had a body of 10,000 men under his command. After his victories over the Moguls, these officers demanded the greatest share of the spoils; which being refused, they left him. He endeavoured to make them hearken to reason; and sent letters to them, representing the inevitable ruin which must attend their separation, as Jenghiz Khan was ad- vancing against them with his whole army. At last they were persuaded to lay aside their animosi- ties, but it was now too late; for Jenghiz, being informed of what passed, detached 60,000 horse to prevent their joining the sultan's army; who, finding himself deprived of this powerful aid, re- tired towards the Indus. When he was ar- rived there, he stopped in a place where the stream was most rapid and the place confined, with a view both to prevent his own soldiers from flying, and to hinder the whole Mogul army from at- tacking him at once. Ever since his departure from Gazna he had been tormented with a colic; yet, at a time when he suffered most, hearing that the enemy's vanguard was arrived at a place in the neighbourhood called *Herder*, he quitted his litter, and, mounting a horse, marched with some of his chosen soldiers in the night; surprised the Moguls in their camp; and having cut them almost all to pieces, without the loss of a man on his side, returned with a considerable booty. Jeng- hiz Khan, finding by this that he had a vigilant e- nemy to deal with, proceeded with great circum- spection. When he came near the Indus, he drew out his army in battalia: to Jagatay and Oktay, his sons, he gave the command of the right and left wings; and put himself in the centre, with 6000 of his guards. On the other side, Ja- loloddin prepared for battle like one who had no resource but in victory. He first sent the boats on the Indus farther off; reserving only one to carry over his mother, wife, and children: but un- luckily the boat split when they were going to embark, so that they were forced to remain in the camp. He himself took the command of the main body. His left wing, drawn up under shelter of a mountain which hindered the whole right wing of the Moguls from engaging at once, was com- manded by his vizir: and his right by a lord na- med *Amin Malek*. This lord began the fight; and forced the enemy's left wing, notwithstanding the great disparity of numbers, to give ground. The right wing of the Moguls likewise wanting room to extend itself, the sultan made use of his left as a body of reserve, detaching thence some squadrons to the assistance of the troops who stood in need of them. He also took one part of them with him when he went at the head of his main body to charge that of Jenghiz Khan; which he did with so much resolution and vigour, that he not only put it in disorder, but penetrated into the place where Jenghiz Khan had originally taken his sta- tion: but that prince, having had a horse killed under him, was retired from thence, to give orders for all the troops to engage. This disadvantage had almost lost the Moguls the battle; for a report be- ing spread that the enemy had broken through the main body, the troops were so much discouraged that they would have fled, had not Jenghiz Khan encouraged them by riding from place to place to

N n

view

show himself. At last, however, Jaloloddin's men, who were in all 30 000, having fought a whole day, with ten times their number, were seized with a panic, and fled. One part of them retired to the rocks on the shore of the Indus, where the enemy's horse could not follow them; others threw themselves into the river and were drowned, though some had the good fortune to cross over in safety; while the rest, surrounded their prince, continued the fight through despair. The sultan, however, considering that he had scarce 700 men left, began to think of providing for his own safety: therefore, having bidden a final adieu to his mother, wife, and children, he mounted a fresh horse, and spurred him into the river, which he crossed in safety, and even stopped in the middle of it to wait for Khizr, who was now arrived at the bank. The sultan fell into the hands of five Moguls; who killed all the mules, and carried the women into captivity. Jaloloddin being lankest in India, got up into a tree to preserve himself from wild beasts. Next day, as he walked melancholy among the rocks, he perceived a troop of his soldiers, with some others, three of whom proved to be his particular friends. These, at the beginning of the defeat, had found a boat in which they had sailed all night, with much danger from the rocks, shelves, and rapid current of the river. Soon after, he saw a horse coming towards him; who informed him of 300 more that had escaped by swimming over the river; and these also soon after joined the rest. In the mean time an officer of his household, named *Jamalarrazad*, knowing that his master and many of his people were escaped, ventured to load a very large boat with arms, provisions, money, and stuff to clothe the soldiers, with which he crossed the river. For some time after, the sultan's affairs seemed to go on prosperously, and he gained some battles in India; but the Indian princes, envying his prosperity, conspired against him, and obliged him to repass the Indus. Here he again attempted to make head against the Moguls, but was at last defeated and killed by them, and a final end put to the once mighty empire of Gazna. The metropolis was reduced by Oktay, who no sooner entered the country in which it was situated, than he committed the most horrid cruelties. The city was well provided with all things necessary for sustaining a siege; had a strong garrison and a brave and resolute governor. The inhabitants, expecting no mercy from Jenghiz Khan, resolved to make a desperate defence. They made frequent sallies on the besiegers, several times overthrew their works, and broke above 1000 of their battering rams. But one night, after an obstinate fight, part of the city walls fell down, and a great number of Moguls having filled up the ditch, entered the city sword in hand. The governor perceiving all was lost, at the head of his bravest soldiers rushed into the thickest of his enemies, where he and his followers were all slain. However, Gazna was not entirely destroyed, nor were the people all killed; for after the massacre had continued 4 or 5 hours, Oktay stopt it, and taxed those who were left alive, to redeem themselves and the city. It does not, however, appear, that after this time Gazna ever made any

considerable figure.—It was taken by A. D. 1222.

GAZIN, a town of Asia, in the Candahar, 106 miles E. of Candahar.

GAZOLDO, a town of the Cilaly in the dep. of Mineo, and 10 miles N. of Mantua, 17 miles WNW. of Mantua.

GAZOLLO, a town of the Cisalpin in the department of Mantua, 13 m. N. of Mantua, seated on the Senio, a tributary of the Po.

* GAZON, *n. f.* [French.] 1. pieces of fresh earth covered with grass, in the form of a wedge, about a foot long and thick, to line parapets and the traverses. *Harv.*

GAZUL, a kind of Barilla. See Barilla. (1) IV, a town of Russia, in the gov. of Petersburg, on the E. coast of lake Ladoga, 90 miles SW. of Petersburg.

* GEAR, *n. f.* [Gyrion, to clothe; nature, Saxon.] 1. Furniture; accoutrement; habit; ornaments.—

Array thyself in thy most gorgeous

When he found her bound, stript of her

And vile tormentors ready saw in
He broke through.

When once her eye
Hath met the virtue of this magick
I shall appear some harmless village
Whom thirst keeps up about his c

—I fancy every body observes me as
street, and long to be in my old plain
Guardian—

To see some radiant nymph appear
In all her glittering birthday gear,
You think some goddess from the
Defended, ready cut and dry.

2. The traces by which horses or oxen
Apollo's spite Pallas discern'd,
Tydeus' son;

His scourge reacht, and his horse
then to kick her angry run

At king Eumelus, brake his gears.

The fraud he learn'd in his fan;

Made him uneasy in his lawful gear

3. Stuff. *Hammer*—If Fortune be
is a good wench for this gear. *Sb. M.*

4. [In Scotland.] Goods or riches; a
counsellor. 5. The furniture of a draught.

GEARON, or JARON, a town in
the province of Farsistan, famous for
miles SE. of Shiraz.

BA, 11 m. Turkey in Asia, in the province of Aleppo; 20 miles S. of Jeddah.

BPR, or **GIANT**, a celebrated philosopher, and mathematician of Arabia, who has been the inventor of Algebra, he must have flourished before A. D.

1122, a king or chief of the Arabs, promiscuous with the above philosopher, wrote several treatises on chemistry, or rather, in Latin; printed from a copy in 1711, at Dantzick, in 1682, in 1610. In it is filled not only *res Arabum*, but *physicæ, mathematicæ, et Astronomicæ*; and in two of these treatises, *Inquisitionis Magisterii*, and *Tessalibus animalium*, &c. he is also filled, though it seems difficult to account for distant titles.

122, John, a physician and astronomer who flourished in the 9th century. He commented on Ptolemy's *Synaxis Mathematica* he attempted to correct his Astronomer; Ptolemy fills him the Calumniator of his works; and wrote several other works, and bore him a learned chemist. But his writings are much stuffed with the jargon of the time that Dr Johnson traces the derivation of *Gibberish* from them. See **GIBBERISH**.

SDORF, a town of Saxony, in the circle of Querfurt, one mile N. of Dahme.

LE, a town of Upper Saxony, in Thuringia NNW. of Erfurt.

172, a town of Bohemia, in the circle W. 2 miles SW. of Leitmeritz.

8. See **GABARS**, N° 1.

1, in natural history, a name given by the ancients to their terrible poison, the smallest which kills when mixed with the blood. But it is a venomous froth or humour it of the mouths of their most poisonous animals; which they procure in this fatal way hanging up the creatures by the tails, and then they collect the venomous froth as it falls; and when they use it, they either poison a weapon with it, or any part of the flesh introduce the venom into it; which is said to cause immediate death.

2, *n. f.* [*geese*, a cackow; *geck*, Germ. and Scottish.] A bubble easily imposed upon.

3, Obsolete.—Why did you suffer your noble heart and brain with drossy, and to become the *geck* and other's villany? *Shak. Cymbeline*.

4, Have you suffer'd me to be imprison'd, to be the most notorious *geck* and gull in invention play'd on? *Twelfth Night*.

5, *v. a.* [from the noun.] To cheat; to deceive.

6, See **LACERTA**.

7, William, goldsmith in Edinburgh, an ingenious unsuccessful artist, deserves to be remembered for his attempt to introduce an improvement of printing. The invention, first

practised by Ged, in 1735, was simply this. From any type of Greek or Roman, or any other character, he formed a plate for every page, or sheet of a book, from which he printed, instead of using a type for every letter, as is done in the common way. This was first practised, but on blocks of wood, by the Chinese and Japanese, and pursued in the first essays of Caster the English inventor of the present art. "This improvement," says James Ged the inventor's son, "is principally and essentially in a most important article, viz. expense, correctness, beauty and uniformity." But these improvements are counteracted. In July, 1739, William Ged entered into partnership with William Fenner, a London Stationer, who was to have half the profits, in consideration of his advancing all the money requisite. To supply this, Mr John James, then an architect at Greenwich (who built Sir Gregory Page's house, Bloomsbury church, &c.) was taken into the scheme, and afterwards his brother Mr Thomas James, a letter-founder, and James Ged the inventor's son. In 1730, these partners applied to the university of Cambridge for printing bibles and common prayer books by blocks instead of single types; and, in consequence, a lease was sealed to them, April 23d. 1731. In their attempt they sunk a large sum of money, and finished only two prayer books; so that it was relinquished and the lease given up in 1738. Ged imputed his disappointment to the villany of the pressmen, and the ill treatment of his partners (which he specifies at large), particularly Fenner, whom John James and he were advised to prosecute but declined it. He returned to Scotland in 1733, where he gave his friends a specimen of his performance, by an edition of Salust. But being still unsuccessful, and having failed in obtaining redress from Fenner, who died insolvent, he was preparing again to set out for London, to join with his son James as a printer there, when he died Oct. 19. 1749. Thus ended his life, and his project; which, ingenious as it seems, is not likely to be revived, if, as Mr Moles suggests, "it must, had it at first succeeded, have soon sunk under its own burden."

GEDALIA, a Jewish Rabbi, who wrote a Treatise on the Creation; and an account of a Series of Traditions from Adam to A. D. 761. He died in 1448.

GEDDES, James, born in 1710, of a respectable family in Scotland, was educated for the bar, and practised several years; but died of a consumption before he arrived at the age of 40. He published *An essay on the composition and manner of writing of the ancients*; and left behind him several other tracts.

GEDERN, a town of Germany, in the circle of the Upper Rhine, belonging to the Prince of Stolberg, 24 m. ENE. of Francfort on the Maine.

GEDIDA, a town of Arabia Deserta, 60 miles W. of Ana.

GEE. A term used by waggoners to their horses when they would have them go faster.

GEELE, **GHABLE** or **GHELE**, a town of the French republic, in the dep. of Dyle, and adjacent prov. of Brabant, 10 miles NW. of Diet.

(2.) **GESE.** See **ANAS**, N° 4, and **GOOSE**.

GEETE, a river of the French republic, in the dep. of Dyle, and late prov. of Brabant. It runs into the Demer at Dalen.

GEEVACH, mountains of Ireland, between the counties of Leitrim and Roscommon, 9 miles NE. of Boyle.

GEEL. See **ETHIOPIA**, § 31.

(1.) **GELE,** a river of Sweden, in the prov. of Gestricia, which runs into the Gulf of Bothnia, 10 miles below the town, N° 2.

(2.) **GELE,** or **GIWLE,** an ancient and populous town of Sweden, in Gestricia, divided and surrounded by an arm of the Gulf of Bothnia, which forms it into two islands. The harbour is good, the chief exports are iron, pitch, tar, and planks. It is 60 miles N. of Upsal. Lon. 17. 1. E. Lat. 60. 50. N.

GEFREES, a town of Franconia, in the county of Bayreuth, 73 miles NNE. of Bayreuth.

GEGE, a river of Prussian Lithuania, which runs into the Wilde, 3 miles SE. of Plafchken.

GEGENBACH. See **GEGENBACH**.

GEGENDE, a town of Turkey, in Bulgaria.

GEGENY, a town of Hungary.

GEGNO, a town of the Cisalpine republic, in the dept. of Lario, and ci-devant county of Como, on the E. bank of Lake Como.

GEHENNA, } [*Fiume*, Gr. of *γεηννα*, Heb. the

GEHINNOM, } valley of Hinnom.] a scripture term which has given some trouble to the critics. It occurs in St Matthew, v. 22. 29. 30. x. 28. xviii. 9. xxiii. 33. Mark, ix. 43. 45. 47, Luke, xii. 5. James, iii. 6. The authors of the Louvain and Geneva versions retain the word *gehenna* as it stands in the Greek; the like does M. Simon: the English translators render it by *hell* and *hell-fire*, and so do the translators of Mons and Father Bours. In the valley of Hinnom, near Jerusalem, there was a place named **TOPHET**, where the idolatrous Jews sacrificed their children to Moloch, by fire. (See **BEN-HINNOM**, and **MOLUCH**.) K. Josias, to render this place for ever abominable, made a common sewer of it, where all the filth and carcases of the city were cast; and where a continual fire was kept up, to burn those carcases; for which reason, as the Jews had no proper term in their language to signify *hell*, they made use of *gehenna* or *gehinnom*, to denote a fire unextinguishable.

GEHMEN, a town of Germany in Westphalia, on the Aa, in the bishopric of Munster, 16 miles NE. of Wesel.

GEHOFEN, a town of Saxony, 3 miles S. of Arnim, in the county of Mansfeld.

GEHRDEN, a town of Saxony, in the principality of Calenberg, 6 miles WSW. of Hanover.

GEHREN, a town of Saxony, 10 1 Arnstadt.

GEIL, a river of Germany, which rolls, runs through Carinthia, and falls into the Drave near Willach.

GEILBERG, a mountain of Carinthia, in the dep. of the Roer, and duchy of Juliers, 8 miles NW. of Juliers.

GEILSDORF, a town of Saxony, in the county of Vogtland, 5 miles SSW. of Plauen.

GEISENFELD, a town of Upper Saxony, 10 miles SE. of Ingoldstadt, and 10 N. of Hofen.

GEISENHEIM, a town of German devant electorate of Mentz, now incl. in the French republic, and dept. of Rhine, 17 miles W. of Mentz.

GEISING, a town of Saxony, in the county of Meissen, one mile S. of Lauer.

GEISINGEN, a town of German Carinthia, in the principality of Furstenberg, 10 miles N. of Schaffhausen, and 19 NW. of Schaffhausen.

GEISLEDE, a river of Germany, in the county of the Lower Rhine, which runs into the Moselle, 12 miles W. of Ulm.

(1.) **GEISMAR,** a town of Hesse, 10 miles NNW. of Cassel, and 11 W. of Cassel.

k of a dozen to geld away two. *Tuffer.*
w-gelder did blow his horn
a cat, but cry'd reform. *Hudib.*

IRLAND. See GUELDERLAND.

ELDER-ROSE. *n. s.* [I suppose brought
terland.] The leaves are like those of
tree: the flowers consist of one leaf, in
rose form. *Miller.*—The *gelder-rose* is in-
suckers and cuttings. *Mort.*

ELDER ROSE. See VIBURNUM, N° 2.

ELDER ROSE, VIRGINIAN. See SPIRÆA.

ELRS. See GULDRES.

ELDING. *n. s.* [from *geld*.] Any animal
particularly an horse.—Though natu-
be more males of horses, bulls or rams,
les; yet artificially, that is, by making
oxen and weathers, there are fewer.
The lord lieutenant may chuse out one
horses, and two of the best *geldings*;
shall be paid 100l. for the horse, and
e for the *geldings*. *Temple.*

ELDING signifies also the operation of
any animal, particularly horses. A colt
lded at 9 or 15 days old, if the testicles
e down; as the sooner he is gelt, the
ill be for his growth, shape, and courage;
orse may be gelt at any age, if proper

care is taken in performing the operation. The
manner of doing it is usually this: The beast be-
ing cast down on some soft place, the operator takes
the testicles between his foremost and his great
finger, and, flitting the scrotum, presses the stones
forth; then taking a pair of nippers made very
smooth, either of steel, box, or brasil wood, he
claps the chord to the testicle between them, a
very little above where the stones are set on, and
presses them so hard that the course of the blood
through the artery is interrupted; then with a thin,
drawing, cauterising iron, he sears away the tes-
ticle. This done, he takes a hard plaster, made of
rosin, wax, and turpentine, well dissolved toge-
ther, and melts it on the seared part, till he has
laid a good thickness of it upon the cauterized
edge. When this is done to one testicle, the nip-
pers are loosened, and the like is done to the other;
and the two incised edges of the scrotum are
brought close together, and kept in that situation
by pieces of sticking plaister. If the part inflames
violently, the horse should be bled, and a poultice
of rye meal, linseed meal, and water, should be
applied. A considerable improvement, however,
on this operation, would be, to perform it exact-
ly as in the human subject, either applying a strong
ligature round the chord of the testicle, or taking
up the blood vessels separately; for the method
commonly used is sometimes fatal to the horse, ow-
ing to the violent inflammation brought on by the
actual cautery. The manner of gelding a hog is
as follows:—The operator, after having made two
cross slits or incisions on the midst of the stones,
presses them out, and takes off the stone. But an-
other general method, yet somewhat more diffi-
cult, is, first, to cut on the side of one stone, and
after having drawn and cut it off, the operator
puts in his fingers at the same slit, and with a lan-
cet cuts the skin between the two stones, and by
that slit presses out the other stone; and thus there
is but one incision made in the cod. Boar pigs
ought to be gelded about six months old; yet
they are commonly gelded about 3 or 4 weeks old.

GELEE, Claude. See CLAUDE, N° 2.

GELENAU, a town of Upper Saxony, 5 miles
WNW. of Greiffenstein.

GELENIUS, Sigismund, a learned and excel-
lent man, born of a good family at Prague, about
1498. Erasmus, conceiving an esteem for him at
Basil, recommended him to John Frobenius as a
corrector for his printing-house; which laborious
charge he accepted, and had a great number of
Hebrew, Greek, and Latin books to correct: he
also translated many works himself from the Greek
into Latin; and published a dictionary in four
languages, Greek, Latin, German, and Sclavo-
nian. Profitable and honourable employments
were offered him in other places, but nothing
could tempt him to quit his peaceful situation at
Basil. He died in 1555. All his translations are
highly esteemed.

GELISE, a river of France, which runs into the Baïse, at Lavardac.

GELLERT, Christian Furchtegott, one of the finest geniuses Germany has produced, was born at Haynichen, in Misnia, in 1715, and studied at Leipzig; at which university he was for many years professor of philosophy and the belles lettres. He early distinguished himself by his talent for poetry; and contracted a strict friendship with the most learned and polite writers in Germany. All his works are filled with sentiment, and bear evidence of the sweetness of his disposition. The most considerable of them are his comedies, spiritual songs, moral poems, sacred odes, tables, and tales. He died in 1769, much lamented.

* GELLI, John Baptist, an eminent Italian writer, born at Florence, in 1498. He was bred a tailor, but had such an extraordinary genius, that he acquired several languages, and made an uncommon progress in the belles lettres; and though he continued always to work at his trade, became acquainted with all the wits and learned men at Florence, and his merit was universally known. He was chosen a member of the academy there, and the city made him a bourgeois. He acquired the highest reputation by his works, which are, 1. *I Capricci del Bottai*, 4to. containing ten dialogues, in the manner of Lucian. 2. *La Circe*, 8vo. This also contains ten dialogues, and treats of human nature. It has been translated into Latin, French, and English. 3. Dissertations in Italian on the poems of Dante and Petrarch. 4. The comedies of *La Spotta* and *La Errore*; and other works. He died in 1563.

GELLIBRAND, Henry, a laborious astronomer of the 17th century, born at London, in 1597. He became so enamoured with mathematical studies, that on the death of his father, he entered a student at Oxford, and devoted himself solely to them. On the death of Mr Gunter, he was recommended by Mr Briggs to the trustees of Gresham college, for the astronomical professorship there; to which he was elected in 1617. His friend Mr Briggs dying in 1630, before he had finished his *Trigonometria Britannica*, it was finished by Gellibrand at his request. He wrote several other works, chiefly tending to the improvement of navigation; and died in 1636.

GELLIUS, Aulus, a celebrated grammarian, who lived in the 2d century under Marcus Aurelius and some succeeding emperors. He wrote a collection of observations on authors, for the use of his children; and called it *Noctes Attice*, because composed in the nights of a winter he spent at Athens. The chief value of it is for preserving many facts and monuments of antiquity not to be

found elsewhere. Critics and grammarians bestowed much pains on this writer.

s, in natural history, are divided into
the pellucid and semipellucid.

, *PELLUCID*. The bodies composing
gems are bright, elegant, and beauti-
naturally and essentially compound,
in small detached masses, extremely
great lustre.

, *SEMIPELLUCID*. The bodies compo-
s, are stones naturally and essentially
not inflammable nor soluble in water,
tached masses, and composed of crys-
tal, debased by earth: however, they
htly debased, and are of great beauty
s, of a moderate degree of transpa-
are usually found in small masses.

s, *HARDNESS AND COLOURS OF*. The
of gems depends principally on obser-
hardness and colour. Their hardness
ly allowed to stand in the following
diamond the hardest of all; then the
hire, jacinth, emerald, amethyst, gar-
et, chalcedony, onyx, jasper, agate, por-
marble. This difference, however, is
r and constant, but frequently varies.
als may be allowed to succeed the onyx;
ole family of metallic glassy fluors seem
fter. In point of colour, the diamond
its transparency, the ruby for its pur-
pplure for its blue, the emerald for its
jacinth for its orange, the amethyst
its carnation, the onyx for its tawny,
agate, and porphyry, for their vermi-
, and variegated colours, and the gar-
transparent blood red. All these gems
nes found coloured and spotted, and
quite limpid and colourless. In this case,
d-cutter knows how to distinguish their
ecies by their different degrees of hard-
the mill. For the cutting or polishing
he fine powder of the fragments of
are next in degree of hardness is always
grind away the softer; but as none of
arder than the diamond, it can only
l by its own powder. Cronstedt ob-
ems in general, that the colours of the
merald are said to remain in the fire,
of the topaz flies off: hence it is usual
topaz, and thence substitute it for the

" Their colours (says our author) are
supposed to depend upon metallic va-
may they not more justly be supposed
on a phlogiston united with a metallic
ber earth? because we find that metal-
which are perfectly well calcined give
o any glass; and that the manganese,
r hand, gives more colour than can be
the small quantity of metal which is
shed from it." M. Magellan is of opi-

nion, that their colour is owing chiefly to the
mixture of iron which enters their composition.
The sentiment of Cronstedt, that phlogiston has a
share in their production, is exploded by the new
doctrines, which deny the existence of phlogiston.
See *CHEMISTRY, Index*.

(5.) *GEMS, IMITATION OF*. See *PASTES*.

(6.) *GEMS, TEXTURE AND COMPONENT PARTS*
OF. With regard to the texture of gems, M. Ma-
gellan observes, that all of them are foliated or
laminated, and of various degrees of hardness.
Whenever the edges of these laminæ are sensible
to the eye, they have a fibrous appearance, and
reflect various shades of colour, which change
successively according to their angular position
to the eye. These are called by the French *cha-
torantes*; and what is a blemish in their transpa-
rency, often enhances their value on account of
their scarcity. But when the substance of a gem
is composed of a broken texture, consisting of va-
rious sets of laminæ differently inclined to each
other, it emits at the same time various irradia-
tions of different colours, which succeed one an-
other according to their angle of position. Gems
of this kind are called *OPALS*, and are valued in
proportion to the brilliancy, beauty, and variety
of their colours. Their crystallization doubtless
depends on the same cause which produces that of
salts, earths, and metals; (See *CRYSTALLIZATION*)
but as to the particular configuration of each
species of gems, we can hardly depend upon
any individual form as a criterion to ascertain each
kind; and when we have attended with the ut-
most care to all that has been written on the sub-
ject, we are at last obliged to appeal to chemi-
cal analysis, because they very often assume va-
rious forms. The following table shows the com-
ponent parts of gems according to the analysis of
Bergman and M. Achard; B denoting Bergman's
analysis, and A that of Achard.

	<i>Argil.</i>	<i>Silic.</i>	<i>Calc.</i>	<i>Ir.</i>
Red oriental ruby, . . .	B 40	39	9	10
Ditto,	A 37.5	42.5	9	11

Ditto from Tyrol, . . .	B 42	40	12	6
Garnet from Bohemia, . .	A 30	48	11	10

The chrysoptase from Koseinitz in Silesia was
likewise analysed by M. Achard; who found that
it contained 456 grains of silicious earth, 13 of
calcareous, 6 of magnesia, 3 of copper, and 2 of
iron. " This (says M. Magellan) seems to be the
only gem that contains no argillaceous earth."

(1.) * To *GEM. v. a. [gemma, Lat.]* To adorn,

(1.) GEMAPPE, } or JEMAPPES, a village of
 (1.) GEMAPPES, } the French republic, in the
 department so named, (N° 2.) formerly in the pro-
 vince of Austrian Hainault, rendered famous by
 a bloody battle fought near it, on the 5th Nov.
 1792, between the French under Dumourier, and
 the Austrians under Clairfait; wherein, after a
 most obstinate resistance, the latter who were
 strongly posted on the heights of Gemappes, were
 compelled to retreat to Mons. The loss on both
 sides must have been great, as there has seldom
 been a more obstinate contest. Perhaps Dumourier
 under-rated his own loss, when he stated it at on-
 ly 900 men, and that of the Austrians at 4000. The
 carnage was so great, that 3 coal pits near this
 village were filled up with dead bodies of men and
 horses. It is seated at the conflux of the Haine
 and the Trouille, 2½ miles SW. of Mons.

(2.) GEMAPPES, or JEMAPPES, a department
 of the French republic, comprehending the ci-
 devant province of Austrian Hainault. See HAI-
 NAULT, N° 1. Mons is the capital.

GEMARA, or GHEMARA, the 2d part of the
 TALMUD. The Hebrew word גמרא, *gemara*, is
 commonly supposed to denote a supplement; but
 in strictness it rather signifies complement, or per-
 fection: being formed of the Chaldee גמר, *gamar*
 or *gamar*, "to finish, perfect, or complete any
 thing." The rabbins called the Pentateuch simply
 the *law*: the first part of the Talmud, which is only
 an explication of that law, or an application there-
 of to particular cases, with the decisions of the
 ancient rabbins thereon, they call the *Mischna*, i.
 e. "second law;" and the 2d part, which is a
 more extensive explication of the same law, and a
 collection of decisions of the rabbins posterior to
 the *Mischna*, they call *Gemara*, q. d. "perfection,
 completion, finishing;" because they esteem it
 the finishing of the law, or an explication beyond
 which there is nothing farther to be desired. The
Gemara is usually called simply TALMUD, the
 common name of the whole work. In this sense,
 there are two *Gemaras* or Talmuds; that of Je-
 rusalem and that of Babylon: though in strictness
 the *Gemara* is only an explication of the *Mischna*,
 given by the Jewish doctors in their schools. See
 MISCHNA. A commentary. Mons. Tillemont ob-
 serves, "was wrote on the *Mischna*, by one Joha-
 nan, whom the Jews placed about the end of the
 2d century; but Fa. Morin proves, from the work
 itself, wherein mention is made of the Turks, that
 it was not wrote till the time of Heraclius, about
 A. D. 620; and this is what is called the *Gemara*,
 or *Talmud of Jerusalem*, which the Jews do not
 use or esteem much because of its obscurity. They
 set a much greater value on the *Gemara*, or Tal-
 mud of Babylon, begun by one Aba; discontinued
 for some time on occasion of the wars with the
 Sarracens; and finished by one Josa, about the
 7th century. See TALMUD. The *Gemara* and the two *Gemaras*,

yet it is properly that of Aba and Josa
 is meant under that name. This the

GEMINIANI, Francis, a celebrat
 and composer, born at Lucca in 1680.
 ved his first instructions in music from
 Scarlatti; and after that became a pup
 Ambrose Lunati, surnamed *Il Gobbo*, a
 brated performer on the violin; afte
 became a disciple of Corelli. In 171
 to England; where he soon recommen
 greatly by his exquisite performance
 he published and dedicated to Baron K
 chamberlain to K. George I. as electo
 ver, 12 sonatas, *a violino violone e cembalo*
 six with fugues and double stops; the l
 of various measures, as allemandes, co
 jiggs. This publication was so well
 the baron, that he mentioned Gemin
 king as an excellent performer; in c
 of which he had the honour to perform
 majesty, in concert with the celebra
 But though Geminiani was exceeding
 yet he had no talent at associating mu
 etry, nor do we find that he ever beca
 performer. He was therefore obliged

istence on the friendship of his patrons, profits which accrued to him from teaching: was also an enthusiast in painting, and stility of his temper was such, that, to his passion, he neglected to exercise his talents, and involved himself in debts. In was offered the place of master and commander of the state music in Ireland; but this could not be conferred on a Catholic, and Geminiani would not change his religion. He then set himself to compose parts to the *opera quinta* of Corelli, to make concertos of the first six of his solos work he completed, and, with the help of his pupils, at the head of which were the the royal family, published in 1726. In 1727 he published his *opera seconda*, which contained celebrated minuet that goes by his name. He published many other pieces, the profits of which did not much mend his circumstances; but his wife was owing to his rambling disposition: was also an utter stranger to the business of an orchestra, and had no idea of the labours necessary in the instruction of singers. The consequence of this was, that his *certo spirituale*, which he had advertised for benefit in 1748, failed in the performance; the audience, however, compassionate, gave; the books were changed, and the performance was continued with compositions of his which he executed in such a manner as was got. The profits arising from this performance enabled him to take a journey to Paris; he staid long enough to get plates engraven of solos, and the parts of two operas. About 1755 he returned to England and advertised them for sale. In 1761, he returned to Ireland; and was kindly entertained by Mr Matthew Dubourg, who had been his friend, and was then master of the king's band in London, through life, had ever been disposed to do him friendly offices. Soon after Geminiani's arrival at Dublin, he was called upon to perform the last. Geminiani had spent many years in compiling an elaborate treatise on music, intended for publication; but soon after his arrival, by the treachery of a female servant, it was said, was recommended to him for her end, but that she might steal it, it was eyed away and could not be recovered. The loss of this, and his inability to re-attain his end; at least he survived it a short time, dying on the 17th of Sept. 1762. His writing list comprises the whole of his publications except 2 or 3 articles of small account. Solos for a violin, *opera prima*; six concertos for seven parts, *opera seconda*; six concertos for eight parts, *opera terza*; twelve solos for a violin, *opera quarta*; six solos for a violoncello, *opera quinta*; the same made into solos for a violin, *opera sexta*; 6 concertos for seven parts, *opera settima*; rules for playing in taste; on good taste; the art of playing the violin, *opera octava*; from his first solos, *opera undecima*; parts to ditto; lessons for the harp, *Guido Armonica*; supplement to ditto; for accompaniment, two books; his first list of concertos in score; and the end.

PART I.

chanted forest.—Of his solos the *opera prima* is esteemed the best. Of his concertos some are excellent, others of them scarce pass the bounds of mediocrity. The 6th of the third opera not only surpasses all the rest, but, in the opinion of the best judges of harmony, is the finest instrumental composition extant.

GEMINIANI, St., a town of Tuscany, on a mountain, in which is a mine of vitriol.

* GEMINOUS. *adj.* [*geminus*, Lat.] Double.—Christians have baptized their *geminous* births, and double consciousnesses, with several names, as conceiving in them a distinction of souls. *Brown.*

* GEMINY. *n. s.* [*geminus*, Latin.] Twins; a pair; a brace; a couple.—I have grated upon my good friends for three reprieves for you, and your couch fellow, Nim; or else you had looked through the grate, like a *geminus* of baboons. *Shakespeare.*—A *geminus* of asses split will make just four of you. *Congreve.*

GEMISTUS, George, surnamed *Philosophus*, a native of Constantinople, from which, upon its capture by the Turks, he retired to Florence. In 1438, he distinguished himself at the council of Florence, by his learning and abilities. He wrote, 1. "Commentaries upon the Magic Oracles of Zoroaster;" a work of profound erudition: 2. A Comparison between Plato and Aristotle: and 3. Historical Treatises; wherein he discovers great knowledge of Grecian history. He died aged above 100.

(I.) GEMMA, Reinier, an eminent Dutch physician, born in Friseland, in 1508. He was well versed in astronomy, and wrote several works on that and other branches of mathematics. He died in 1555, aged 47.

(II.) GEMMA, Cornelius, son of the preceding, was also famous for his knowledge of mathematics. He died in 1579, aged 44.

(III.) GEMMA, or BUD. in botany. See BOTANY, § 107—109. Buds, as well as bulbs, which are a species of buds, constitute that part of the herb called by Linnaeus *HYBERNACULUM*, or the winter quarters of the future vegetable: a very proper appellation, as it is during that severe season that the tender rudiments are protected. Plants, considered in analogy to animals, may be reckoned both viviparous and oviparous. Seeds are the vegetable eggs; buds, living fetuses, or infant plants, which renew the species as certainly as the seed. Buds are placed at the extremity of the young shoots, and along the branches, being fixed by a short footstalk upon a kind of brackets, the remainder of the leaves, in the wings or angles of which the buds in question were formed the preceding year. They are sometimes placed single; sometimes two by two, either opposite or alternate; sometimes collected in greater numbers in whirls or rings. With respect to their construction, buds are composed of several parts artificially arranged. Externally, we find a number of scales that are pretty hard, frequently armed with hairs, hollowed like a spoon, and placed over each other like tiles. These scales are fixed into the inner plates of the bark, of which they appear to be a prolongation. Their use is to defend the internal parts of the bud; which, being unfolded, will produce, some, flowers, leaves.

and stipule; others, footstalks and scales. All these parts, while they remain in the bud, are tender, delicate, folded over each other, and covered with a thick clammy juice, which is sometimes resinous and odiferous, as in the tarcham tree. This juice serves not only to defend the more tender parts of the embryo plant from cold, the assaults of insects, and other external injuries; but likewise from excessive perspiration, which, in its young and infant state, would be very destructive. It is conspicuous in the buds of horse-chestnut, poplar, and willow trees. In general, we may distinguish 3 kinds of buds; viz. 1. *Florifera*, that containing the flower; 2. *Folifera*, that containing the leaves; and 3. *Poliifero-florifera*.

1. *GEMMA FLORIFERA*, termed by the French *bouton fleur*, or *à fruit*, contains the rudiments of one or several flowers, folded over each other, and surrounded with scales. In several trees, this kind of bud is commonly found at the extremity of certain small branches, which are shorter, rougher, and less garnished with leaves, than the rest. The external scales of this species are harder than the internal; both are furnished with hairs, and in general more twisted than those of the 2d sort. This species too is commonly thicker, shorter, almost square, less uniform, and less pointed; being generally terminated obtusely. It is called by Pliny *oculus gemme*; and is employed in that species of grafting called *inoculation*, or *budding*.

2. *GEMMA FOLIFERA*, termed by the French *bouton à feuilles*, or *à bois*, contains the rudiments of several leaves, which are variously folded over each other, and outwardly surrounded by scales, from which the small stipule, seated at the foot of the young branches, are chiefly produced. These buds are commonly more pointed than the former sort. In the hazel nut, however, they are perfectly round; and in horse-chestnut, very thick.

3. *GEMMA FOLIFERA ET FLORIFERA*. } The
4. *GEMMA FOLIFERO-FLORIFERA*. } third
sort of bud is smaller than either of the preceding; and produces both flowers and leaves, though not always in the same manner. Sometimes the flowers and leaves are unfolded at the same time. This mode of the flower and leaf bud is termed by Linnæus *gemma folifera & florifera*. Sometimes the leaves proceed or emerge out of this kind of bud upon a small branch, which afterwards produces flowers. This mode of the flower and leaf bud is termed by Linnæus *gemma folifero-florifera*, and is the most common bud of any. Such buds as produce branches adorned only with leaves, are called *barren*; such as contain both leaves and flowers, *fertile*. From the bulk of the bud we may often with ease foretell whether it contains leaves only, or leaves and flowers together, as in cherry and pear trees. Neither the buds produced on or near the root, called by

others *swaines*; nor those produced on the 1 from the angles or wings of the leaves, 1 strict propriety, an entire delineation & since the roots are wanting; and in 1 shoots are contained with leaves on- 1 th flowers: but as a branch may 1 a part similar to the whole plant,

and, if planted, would in process of 1 exhibit or produce roots and flowers, 1 general allow, that the bud contain 1 plant, or the principles of the whole; 1 may be unfolded *ad libitum*; and the 1 the seed in containing a delineation of 1 plant in embryo: for although the b 1 radicle, or plumula, of which the seed 1 yet it would undoubtedly form one, 1 the earth. But as the medullary pa 1 to the bud is too tender, and by the a 1 juice flowing into it from the earth w 1 posed to putrefaction, the buds are 1 in the soil, but generally inserted with 1 of another tree; yet placed so that the 1 of the marrow or pith, adhering to 1 be inserted into the pith of the branch 1 fissure or cleft is made, by which mea 1 large communication of juice. This pr 1 gems or buds, called *inoculation*, 1 by practised with the first sort of bud 1 scribed. From the obvious uses of it 1 may collect the reason why the Author 1 granted this sort of protection to most 1 that are natives of cold climates; and 1 ther hand, denied it to such as, enjoy 1 benign atmosphere, have not the ten 1 their embryo shoots exposed to inju 1 predations from the severities of the w 1 this latter kind are the plants of the so 1 some of them very large trees; other sm 1 vegetables, of the shrub and under 1 Citron, orange, lemon, cassava, mi 1 blad apple, shrubby swallow-weed, alate 1 by geraniums, berry bearing alder, Cl 1 Syrian mallow, baobab or Ethiopian 1 justicia, mild fenna, the acacias and fer 1 coral tree, stinking bean trefoil, medi 1 der, viburnum, lumach, isy, tamar 1 Barbadoes cherry, lavatera, rus, shr 1 shade, Guinea henweed, cypress, li 1 and saine, a species of juniper. On a 1 whose root as well as stalk perishes a 1 true buds are never produced; in 1 however, are protruded small branch 1 the feather, from the wings of the le 1 wither without any farther expansion 1 climb and have no lateral branches; 1 by their own nature or from abund 1 the plants become branched, the ram 1 tioned obtain an increase similar to 1 whole plant. The same appearance o 1 trees of warm countries, such as those on 1 the above list, in which a plumula, or fi 1 sends forth branches without a scaly co 1 in such countries, this tender part req 1 fence or protection from cold. A se 1 then is peculiar to buds, as it protect 1 embryo inclosed from all external inju 1 we therefore speak of trees having b 1 naked or without scales, the meaning 1 have no buds at all. The buds that 1 folded the following year, break for 1 evolved buds of the present year, in 1 ner as to put on the appearance of se 1 ces in the wings or angles of the lea 1 eminences or knots grow but little 1 summer; as, in that season, the sap

increase of the parts of the plant: but in when the leaves begin to wither and fall off, placed on the wings, increase; and the plant contained in the bud is so expanded the leaves and flowers, the parts to be e the following year, are distinctly visible. horse-chestnut the leaves, and in cornel- flowers, are each to be observed in their e buds. As each bud contains the rudiment of a plant, and would, if separated from the vegetable, become quite similar to it; to shew the wonderful fertility of nature made a calculation, by which it appears, trunk scarce exceeding a span in breadth, buds (that is, herbs) may be produced. infinite number, then, of plants might grow from a very large tree!

GEMMARY. *adj.* [from *gem.*] Pertaining to jewels.—The principle and *gemmary* affords its tranfluency: as for irradiancy, which is in many gems, it is not discoverable in *gem's Vulgar Errors*.

GEMMATIO, } [from *gemma*, a bud;] a
GEMINATION, } term used by Linnæus, expressing the form of the buds, their origin, and extent. See *BOTANY, Index*.

GEMMEOUS. *adj.* [*gemmeus*, Lat.] 1. Tending to be gemmed.—Sometimes we find them in the gem itself. *Woodw.* 2. Resembling gems. **GENÈVE**, a mountain of the Helvetic republic, in the great chain, which separates the canton of Valais from the Valais. It is 10,110 feet high, 10 miles E. of Sion.

GENÈVE. See *GEMINGEN*.

GEMMOSITY. *n. f.* [from *gem.*] The quality of being a jewel. *Dist.*

GEMONIA, a district of Maritime Austria, in the province of Friuli, containing 1 town, 2 parishes, and 2000 inhabitants.

GEMONIA, an ancient and opulent borough in Maritime Austria, in Friuli, 12 miles NNW. of Udine. It was taken by the French in 1797.

GENIÆ SCALÆ, or } in Roman antiquity,
GENII GRADUS, } was much the same as the gibbet in Britain. Some say they are so denominated from the person who raised them; others, from the first criminal that suffered on them; and others, from the verb *gemo*, to groan. The *gemonii gradus*, according to Julius Victor and Sextus Rufus, was a scaffold on several steps, from whence they executed their criminals; others represent it as a place whereon offenders were executed, and afterwards exposed to public view. The *gemonie* were in the 10th region of the city, near the temple of Juno. Camillus first appropriated the scaffold to his use, A. U. C. 358.

GENÈSAC, a town of France, in the dep. of Vendée, 5 miles W. of Pons, and 10½ S. of Nantes.

GENÈTE. *n. f.* A meeting; The court of justice. Obsolete.

GENÈND, the name of 6 towns of Germany: **GENÈND**, in Austria, 68 m. NW. of Vienna. **GENÈND**, **GEMUNDEN**, or **GEMUYD**, in Austria, situated on the Traun See, 24 m. WSW. of Vienna, and 108 WSW. of Vienna; famed for its baths.

3. **GEMUND**, in Carinthia, 10 miles NE. of Saxenburg, and 37 NW. of Clagenfurt.

4. **GEMUND**, or **GEMUNDEN**, in the circle of Franconia, and bishopric of Wurzburg, N. of the Maine; 27 miles W. of Schweinfurt, and 37 E. of Francfort. Lon. 9. 55. E. Lat. 49. 55. N.

5. **GEMUND**, or **GEMUNDE**, in the ci-devant duchy of Juliers, now annexed to the French republic, and included in the department of the Roer. It is seated on the Roer, 24 miles SW. of Cologne, and 41 WNW. of Coblenz. Lon. 6. 48. E. Lat. 50. 38. N.

6. **GEMUND**, or **GMUND**, in Suabia, on the Reims, 24 miles E. of Stuttgart, and 30 N. by W. of Ulm. This town is imperial, and its magistrates are chosen by the people. Lon. 9. 48. E. Lat. 48. 48. N.

GEMUNDE. See *GEMUND*, N° 5.

(1.) **GEMUNDEN**, a town of Hesse Cassel, 16 miles SW. of Fritzlar, and 28 SW. of Cassel.

(2.) **GEMUNDEN**, a town of Germany, in the circle of the Upper Rhine, and late county of Leiningen; now included in the French republic and department of Mont Tonnerre.

(3, 4.) **GEMUNDEN.** See *GEMUND*, N° 2 & 4.

GEMUYD. See *GEMUND*, N° 2.

GENADEL, a mountain of Africa, in Nubia, over which the Nile runs, and forms a cataract; 45 miles N. of Jalac.

GENAP, or **GENÈVE**, a town of the French republic, in the department of the Dyle, and late province Austrian Brabant, on the Dyle, 5 miles E. of Nivelles, and 15 SE. of Brussels. Lon. 4. 40. E. Lat. 50. 40. N.

GENBERABA, a town of Persia, in the province of Irak, 100 miles E. of Amadan.

GENCAY, a town of France, in the department of Vienne, 12 miles NNE. of Civray, and 4 S. of Poitiers.

(1.) **GENDARMES**, or **GENÈS D'ARMES**, in the French armies, a denomination given to a select body of horse, on account of their succeeding the ancient gendarmes, who were thus called from their being completely clothed in armour. (See § 3.) These troops were commanded by captain-lieutenants, the king and the princes of the blood being their captains; the king's troop, besides a captain-lieutenant, had two sub-lieutenants, 3 ensigns, and 3 guidons.

(2.) **GENDARMES, GRAND**, were a troop composed of 250 gentlemen; the king himself was their captain, and one of the first peers their captain lieutenant, who has under him 2 lieutenants, 3 ensigns, 3 guidons, and other officers.

(3.) **GENDARMES, SCOTS**, were originally instituted by Charles VII. of France, about the middle of the 15th century, and formed a part of his guard; in which station also they acted under other princes. It was their prerogative to take precedence of all the companies of the gendarmerie of France; and, on particular occasions, they even preceded the two companies of the king's mousquetaires. The sons of the Scottish monarchs were the usual captains of this company; and, after Mary's accession to the throne, its command belonged to them as a right. Hence James VI. made a claim of it for his son prince Henry. This

 th ... company; but it was conferred on his brother the duke of York, who was captain of the Scots gendarmes till 1667, when he resigned his commission into the hands of the French king. Since that time no native of Great Britain has enjoyed this command. See GUARDS, SCOTS.

(4.) GENDARMES, SMALL, were the Scots gendarmes, the queen's, the dauphin's, the gendarmes of Anjou, Burgundy, the English and Flemish gendarmes, having each a captain lieutenant, sub-lieutenant, ensign, guidon, and quarter-master. All these different gendarmeries are now abolished, in consequence of the revolution.

(1.) * GENDER. *n. f.* [*genus*, Latin; *genre*, French.] 1. A kind; a sort. Not in use.—Our bodies are our gardens, to the which our wills are gardeners; so that if we will supply it with one *gender* of herbs, or distract it with many, the power and corrigible authority of this lies in our will. *Othello*.

The other motive,

Why to a publick court I might not go,

Is the great love the general *gender* bare me.

Shak. Hamlet.

n. a. fex. 3. [In grammar.] A denomination given to nouns from their being joined with an adjective in this or that termination. *Clark*.—Cubitus, sometimes cubitum in the neutral *gender*, signifies the lower part of the arm on which we lean. *Arbutnot*.—Ulysses speaks of Nausicaa, yet immediately changes the words into the masculine *gender*. *Boome*.

(2.) GENDER, in grammar, (§ 1. *def.* 3.) is a division of nouns, to distinguish the two sexes. This was the original intention of gender: but afterwards other words, which had no proper relation either to the one sex or the other, had genders assigned them, rather out of caprice than reason; which is at length established by custom. Hence genders vary according to the languages, or even according to the words introduced from one language into another. Thus, *arbor*, a tree, in Latin is feminine, but *arbre* in French is masculine; and *dens*, a tooth, in Latin is masculine, but *dent* in French is feminine, though the meaning is the same. The oriental languages frequently neglect the use of genders, and the Persian has none at all. The Latins, Greeks, &c. generally content themselves to express the different genders by different terminations; as *bonus equus*, a good horse; *bona equa*, a good mare, &c. But in English we frequently go further, and express the difference of sex by different words: as boar, sow; boy, girl; buck, doe; bull, cow; dog, bitch, &c.—We have also about 24 feminines, distinguished from the males, by the variation of the termination of the male into *ess*; of which number are abbot, abbess; count, countess; actor, actress; prince, princess, &c. which is all that our language knows of any thing like genders. The Greek and Latin, besides the masculine and feminine, have the neuter, common, and the doubtful gender; and like-

wife the epicene, or promiscuous, which single gender and termination include kinds.

(1.) * To GENDER. *v. a.* [*engendre*, French.] 1. To beget. 2. To produce; to cause. In such and unlearned questions avoid, for they do *gender* strife. *2 Tim. ii. 23.*

(2.) * To GENDER. *v. n.* To breed.—

A cistern for foul toads

To *gender* in.

—Thou shalt not let thy cattle *gender* verse kind. *Lev. xix. 19.*

GENDRAY, a town of France, in the department of Jura, 10 miles E. of Auxonne.

(1.) GENDRE, Gilbert Charles L. of St Aubin, counsellor in the parliament and master of requests. He wrote *several* but is chiefly distinguished by his *Travail*, 9 vols 12mo; a curious performance by historic examples, the empire of the works of art and science. He died 1746, aged 59.

(2.) GENDRE, Lewis L., an ecclesiastic born at Rouen, in 1659. He became Notre Dame at Paris, and abbot of D at Claire Fontaine. He wrote a great works; the principal are: 1. The M Customs of the French, in the different that monarchy. 2. An History of F vols folio, and in 7 12mo. 3. The Life D'Amboise. 4. An Essay on the reign of the Great. He died in 1733, aged 74.

GENEALOGICA ARBOR, or THE SANGUINITY, signifies a genealogy drawn out under the figure of a tree, with stock, branches, &c. The genealogy are usually represented in circles, round, and aside each other. This called *stemma*, a word signifying cross or the like. See CONSANGUINITY and the plate there referred to.

* GENEALOGICAL. *adj.* [from Pertaining to descents or families; p the history of the successions of house]

* GENEALOGIST. *n. f.* [*genealogiste*, French.] He who traces descent

(1.) * GENEALOGY. *n. f.* [*genealogia*, Greek.] History of the succession of families; or of descent in order of succession; 2. The ancients ranged chaos into seven and in that order successively rising on ther, as if it were a pedigree or *genealogical* Theory.

(2.) GENEALOGY comprehends a full count of the relations and alliances of family, both in the direct and collate divers military orders, it is required to deduce produce their genealogy, so they are noble by so many descents.

GENEHOA, a kingdom of Africa land.

GENEP, or GENNEF, a strong to many, in the circle of Westphalia, subject to the king of Prussia, but now the French republic, and department is seated on the Neers, near the Ma SW. of Cleves. Lon. 5. 48. E. Lat.

GENERABLE, *adj.* [from *genere*, Lat.] That be produced or begotten.

ENERAC, a town of France, in the department of Gard, 5 miles S. of Nîmes.

*) **GENERAL**, *adj.* [*general*, French; *generalis*, Latin.] 1. Comprehending many species or individuals; not special; not particular.—To condescend from particulars to *generals* is a false way of arguing. *Brown*. 2. Lax in signification; not confined to any special or particular import.—When the author speaks more strictly and particularly on any theme, it will explain the more general expressions. *Watts*. 3. Not restricted by narrow or distinctive limitations.—An idea is an idea in the mind, considered as separated from time and place, and so cannot represent any particular being that is con- siderable to it. *Locke*. 4. Relating to a whole class of men, or a whole kind of any being. *Whitgift*. 5. Publick; comprising the

How would we deign him burial of his men,
He disburied at St Colmeskill isle,
A thousand dollars to our *gen'ral* use. *Macb.*
For fail'd they to express how much they
prais'd,

For the *general* safety he despis'd
Milton's *Paradise Lost*.

It directed to any single object.—If the same
peculiarly evil, that *general* aversion will
into a particular hatred against it. *Spratt*.
No relation to all.—

The wall of Paradise upsprung,
To our *general* fire gave prospect large,
Neither empire neighb'ring round. *Milt.*
We, though not universal. 9. Common;

I've been bold,
That I knew it the most *general* way. *Timon*.
General is appended to several offices: as, *At-*
General, *Solicitor General*, *Vicar General*.

*) **GENERAL**, *n. s.* 1. The whole; the to-
tal; the main, without insisting on particulars.
That which makes an action fit to be command-
ed, forbidden, can be nothing else, in *general*,
a tendency to promote or hinder the attain-
ment of some end. *Norris*.—In particulars our
judgment begins, and so spreads itself by degrees
to *generals*. *Locke*.—I have considered Milton's
Paradise Lost in the fable, the characters, the sen-
timents, and the language; and have shewn that
all, in *general*, under each of these heads.

*)—An history painter paints man in *gene-*
ral; a portrait painter a particular man, and con-
sequently a defective model. *Reynolds*. 2. The
whole; the interest of the whole. Not in use.
Neither my place, nor aught I heard of business,
Thrall'd me from my bed; nor doth the *general*
hold on me; for my particular grief

It swallows other sorrows. *Othello*.
vulgar; not in use.—The play, I remem-
bered not the million; 'twas caviare to the
eye; but it was, as I received it, and others,
judgment in such matters cried in the top
of it, an excellent play. *Shak. Hamlet*. 4. [*Ge-*
neral.] One that has the command over an

army.—A *general* is one that hath power to com-
mand an army. *Locke*.—The *generals* on the ene-
my's side are inferior to several that once com-
manded the French armies. *Addison*.—

The war's whole art each private soldier knows,
And with a *gen'ral's* love of conquest glows.

Addison.

(3.) **GENERAL**, § 1. *def.* 10. See **ATTORNEY**,
SOLICITOR, &c.

(4.) **GENERAL** is also used for the chief of an
order of monks; or of all the houses and congrega-
tions established under the same rule; as, the
general of the Franciscans, Cistercians, &c.

(5.) **GENERAL** is also used for a particular
march, or beat of drum; being the first which
gives notice, commonly in the morning early, for
the infantry to be in readiness to march.

(6.) **GENERAL**, **ADJUTANT**, in the art of war,
one who attends the general, (See § 9.) assists in
councils, and carries the general's orders to the
army. He distributes the daily orders to the ma-
jors of brigade. He is likewise charged with the
general detail of the duty of the army. The ma-
jors of brigade send every morning to the adjutant-
general an exact return, by battalion and compa-
ny of the men of his brigade. In a day of battle
he sees the infantry drawn up; after which, he
places himself by the general, to receive any orders
which may regard the corps of which he has the
detail. In a siege, he orders the number of work-
men demanded, and signs the warrant for their
payment. He receives the guards of the trenches
at their rendezvous, and examines their condition;
he gives and signs all orders for parties. He has
an orderly serjeant from each brigade of infantry
in the line, to carry such orders as he may have
occasion to send from the general.

(7.) **GENERAL ASSEMBLY**. See **ASSEMBLY**, §
1. **PRESBYTERIAN**, and **SCOTLAND**.

(8.) **GENERAL CHARGE**, in law. See **CHARGE**,
§ 8.

(9.) **GENERAL IN CHIEF OF AN ARMY**, (§ 2,
def. 4.) in the art of war. See **WAR**.

(10.) **GENERAL**, **LIEUTENANT**. See **LIEUTE-**
NANT-GENERAL.

(11.) **GENERAL**, **MAJOR**. See **MAJOR-GENE-**
RAL.

(12.) **GENERAL OF ARTILLERY**. See **ORD-**
NANCE.

(13.) **GENERAL OF FOOT**, and } are officers

(14.) **GENERAL OF HORSE**, } next under
the general of the army, and have upon all occa-
sions an absolute authority over all the horse and
foot.

(15.) **GENERAL TERMS**, among logicians, those
which are made the signs of general ideas. See
LOGIC and **METAPHYSICS**.

(16.) **GENERAL WARRANT**. See **WARRANT**.

(1.) * **GENERALISSIMO**, *n. s.* [*generalissimo*,
French, from *general*.] The supreme comman-
der. It is often rather a title of honour than office.
—Commission of *generalissimo* was likewise given
to the prince. *Clarendon*.—Pompey had deserved
the name of great; and Alexander, of the
same cognomination, was *generalissimo* of Greece.
Brown.

(2.) **GENERALISSIMO** is called also *captain-ge-*
neral, and simply *general*. He commands all the
military

military powers of a nation; gives orders to all the other general officers; and receives no orders himself but from the king. *M. Balzac* observes, that cardinal Richelieu first coined this word, of his own absolute authority, upon his going to command the French army in Italy.

* **GENERALITY.** *n. f.* [*generalité*, French; from *general*.] 1. The state of being general; the quality of including species or particulars.—Because the curiosity of man's wit doth with peril wade farther in the search of things than were convenient, the same is thereby restrained unto such generalities as, every where offering themselves, are apparent to men of the weakest conceit. *Hooker*.—These certificates do only in the *generality* mention the parties contumacious and disobedient. *Ayliffe*. 2. The main body; the bulk; the common mass.—Necessity, not extending to the *generality*, but resting upon private heads. *Ruleigh's Eff.*—By his own principles he excludes from salvation the *generality* of his own church; that is, all that do not believe upon his grounds. *Tillotson*.—The *generality* of the English have such a favourable opinion of treason, nothing can cure them. *Addison*.—They publish their ill-natured discoveries with a secret pride, and applaud themselves for the singularity of their judgment, which has found a flaw in what the *generality* of mankind admires. *Addison*.—The wisest were distracted with doubts, while the *generality* wandered without any ruler. *Rogers*.

* **GENERALLY.** *adv.* [from *general*.] 1. In general; without specification or exact imitation.—I am not a woman to be touch'd with so many giddy fancies as he hath *generally* taxed their whole sex withal. *Shak*.—*Generally* we would not have those that read this work of *Sylva Sylvarum*, account it strange that we have set down particulars untried. *Bacon's Nat. Hist.* 2. Extensively, though not universally. 3. Commonly; frequently. 4. In the main; without minute detail; in the whole taken together.—*Generally* speaking, they live very quietly. *Guardian*.—*Generally* speaking, they have been gaining ever since, though with frequent interruptions. *Savisi*.—*Generally* speaking, persons designed for long life, though in their former years they were small eaters, yet find their appetites encrease with their age. *Blackmore*.

* **GENERALNESS.** *n. f.* [from *general*.] Wide extent; though short of universality; frequency; commonness.—They had, with a general consent, rather springing by the *generalness* of the cause than of any artificial practice, set themselves in arms. *Sidney*.

* **GENERALTY.** *n. f.* [from *general*.] The whole; the totality.—The municipal laws of this kingdom are of a vast extent, and include in their *generality* all those several laws which are allowed as the rule of justice and judicial proceedings.

* **GENERANT.** *n. f.* [*generant*, Latin.] The begetting, or productive power.—Some believe the soul made by God, some by angels, and some by the *generant*; whether it be immediately created or traduced hath been the great ball of contention. *Glanville*.—In such pretended generations the *generant* or active principle is supposed to be sun, which, being an inanimate body, can otherwise than by his heat. *Raj*.

(1.) * **TO GENERATE.** *v. a.* [*generare*, Latin.] 1. To beget; to propagate.—The which being wild *generate* seldom, *generate* often. *Bacon's Nat. Hist.* 2. To life; to procreate.—

God created the great whales, 1
Soul living, each that crept, which
The waters *generated* by their kind
Or find some other way to *gener*
Mankind. *Milton's l.*

3. To cause; to produce.—Sounds, where there is no air at all. *Bacon*. *generates* a quantity of good chyle, & *generat* milk. *Arbutn. on Alim.*

(2.) **TO GENERATE**, in music, is to signify the operation of that mechanical figure, which every sound has in prod more different sounds. Thus any, however simple, produces along w octave, and two other sounds extr viz. its twelfth above, that is to say, its fifth; and the other the 7th above ther words, the double octave of i Whether we suppose this procreation to result from an aptitude in the texture of certain particles in the air, ing to our ears vibrations that bear t tions one to another, as being de once by the partial and total oscilla musical string; or from whatever ecc ture we choose to trace it; the p found thus to produce another, t tion, is said to *generate*. The same phed, by Signior Tartini and his f any two sounds which, simultaneously, duce a third.

GENERATED, or **GENITED**, *part* by some mathematical writers, for produced, either in arithmetic, by t cation, division, or extraction of root ometry, by the invention of the con and fides; or of extreme and mean p without arithmetical addition and sub

GENERATING LINE, or **FIGURE** try, is that which, by its motion o produces any other figure, plane o **GENESIS**, § 3.

(1.) * **GENERATION.** *n. f.* [from *generation*, French.] 1. The act of producing.—Seals make excellent and so it may be thought of sounds *generation*: but then the dilation of out any new sealing, shews they ca pressions. *Bacon's Nat. Hist.*—

He longer will delay, to hear the
His *generation*, and the rising birth
Of nature, from the unapparent de

 ey come nearer to the more ancient
 et.—Every where throughout all gene-
 ges of the Christian world, no church
 ed the word of God to be against it.

ERATION is also used, though some-
 perly, for genealogy, or the series of
 ed from the same stock. Thus the
 t Matthew commences with the book
 ation of Jesus Christ, &c. The latter
 curate translators, instead of generation
 l genealogy.

ERATION, in mathematics, is used for
 on or production of any geometrical
 f equations, curves, solids, &c.

ERATION, in physiology. (§ 1. def. 1.)
 MY, *Index.*

ERATION, in theology. The Father
 me divines to have produced his Word
 n all eternity, by way of generation;
 ccasion the word generation raises a
 a: that procession, which is really
 he way of understanding, is called ge-
 cause in virtue thereof, the Word be-
 o him from whom he takes this origi-
 St Paul expresses it, is the figure or
 substance, *i. e.* of his being and nature.
 t is, they say, that the second Person
 ty is called the Son.

ERATION. (§ 1. def. 5.) See AGE.
 makes three generations in an hundred
 h computation appears from the lat-
 of political arithmetic to be pretty just.
 ERATION OF FISHES. See ICHTHYO-
 ZOOTOMY.

ERATION OF INSECTS. See ENTO-
 m. III; and ZOOTOMY.

ERATION OF PLANTS. See BOTANY.

GENERATIVE. *adj.* [*generatif*, French, from
 n.] 1. Having the power of propa-
 gave to all, that have life, a power
 thereby to continue their species and
ib's Hist.—In grains and kernels the
 is but the nutriment of that generative
 disproportionable unto it. *Brown.*
 ; having the power of production;
 there hath been such a gradual dimi-
 he generative faculty upon the earth,
 ere not the like decay in the produc-
 tables? *Bentley.*

GENERATOR. *n. f.* [from *genero*, Latin.]
 which begets, causes, or produces.—

Imagination assimilates the idea of the generator
 into the reality in the thing engendered. *Brown's*
Vulg. Err.

(2.) GENERATOR, in music, signifies the prin-
 cipal sound or sounds by which others are pro-
 duced. Thus the lowest C for the treble of the
 harpsichord, besides its octave, will strike an atten-
 tive ear with its twelfth above, or G in alt, and
 with its seventeenth above, or E in alt. The C,
 therefore, is called their generator, the G and E
 its products or harmonics. But in the approxi-
 mation of chords, for G, its octave below is sub-
 stituted, which constitutes a fifth from the gene-
 rator, or lowest C; and for E, is likewise sub-
 stituted its 15th below, which, with the above
 mentioned C, forms a third major. To the lowest
 notes, therefore, exchanged for these in alt by
 substitution, the denominations of products or
 harmonics are likewise given, whilst the C retains
 the name of their generator. But still according
 to the system of Tartini, two notes in concord,
 which when sounded produce a third, may be
 termed the concurring generators of that third.
 See *Generation Harmonique, par M. Rameau*; also
 that delineation of Tartini's system, called *The*
power and principles of harmony.

(1.) * GENERICAL, GENERICK. *adj.* [*gene-
 rique*, French; from *genus*, Latin.] That which
 comprehends the genus, or distinguishes from a-
 nother genus, but does not distinguish the species.
 —The word consumption being applicable to a
 proper and improper, to a true and bastard con-
 sumption, requires a generical description quadrate
 to both. *Harvey.*—Though wine differs from other
 liquids, in that it is the juice of a certain fruit;
 yet this is but a general or generick difference; for
 it does not distinguish wine from cyder or perry:
 the specifick difference of wine, therefore, is its
 pressure from the grape. *Watts's Logick.*

(2.) GENERICAL NAME, in natural history, the
 word used to signify all the species of natural bo-
 dies, which agree in certain essential and peculiar
 characters, and therefore comprehending all of
 the same GENUS family or kind; so that the word
 used as the generical name equally expresses every
 one of the genus, and other words expressive of
 the peculiar qualities or figures of each species are
 added, in order to denote them distinctly, and
 make up what is called the specific name. See
 BOTANY and ZOOLOGY.

* GENERICALLY. *adv.* [from *generick*.]
 With regard to the genus, though not the species.
 —These have all the essential characters of sea-
 shells, and shew that they are of the very same
 specifick gravity with those to which they are so
 generically allied. *Woodward.*

* GENEROSITY. *n. f.* *generosité*, French; *ge-
 nerofitas*, Latin.] The quality of being generous;
 magnanimity; liberality.—Can he be better prin-
 cipated in the grounds of true virtue and generosity
 than his young tutor is? *Locke on Educ.*—It would
 not have been your generosity, to have passed by
 such a fault as this. *Locke.*

* GENEROUS. *adj.* [*generosus*, Latin; *gene-
 reux*, French.] 1. Not of mean birth; of good
 extraction. 2. Noble of mind; magnanimous;
 open of heart.—

f a vigorous kind,
es of the mind. *Dryden.*
nefs to defend
t friend. *Swift.*
k fann'd the poet's fire,
and with reason to admire.

Pope.
 common, not more learn'd than

ous as his noble blood. *Pope.*
who wit and gold refines,
he ripens mines. *Pope.*
Theano, heav'nly fair,
anger with a mother's care.

Pope.
ch forms, with such length,
finest, as you use for your-
all little ill-natured passions
ow great and generous, de-

bers, *ad*
delight in
is used of animals. *Sprightly;*

the imperial eagle does not stay
Till the whole carcase he devour,
As if his *gen'rous* hunger understood
That he can never want plenty of food,
He only sucks the tasteful blood. *Cowley.*
Astizon spies

Hisop'ning hounds, and now he hears their cries:
A gen'rous pack. *Addison.*

4. Liberal; munificent.—

When from his vest the young companion
bore
The cup the *gen'rous* landlord own'd before,
And paid profusely with the precious bowl,
The stinted kindness of this churlish soul. *Par.*
Faith by the margin of her native flood,
Whose wealthy waters are well known to fame,
Fair as the bordering flowers the princely
flood,
And rich in bounty as the *gen'rous* stream.

Heigh on Pharaoh's Daughter.

5. Strong; vigorous.—Having in a digestive fur-
 nace drawn off the ardent spirit from some good
 sack, the phlegm, even in this *generous* wine, was
 copious. *Boyle.*

Those who in southern climes complain,
From Phœbus' rays they suffer pain,
Must own that pain is well repaid,
By *gen'rous* wines beneath a shade. *Swift.*

* *GENEROUSLY.* *adv.* [from *generous.*] 1.
 Not meanly with regard to birth. 2. Magnani-
 mously; nobly.—

When all the gods our ruin have foretold,
Yet *gen'rously* he does his arms withhold.

Dryd. Ind. Bmp.

3. Liberally; munificently.

* *GENEROUSNESS.* *n. f.* [from *generous.*]
 The quality of being generous.—Is it possible to
 conceive that the overflowing *generousness* of the
 divine Nature would create immortal beings with
 mean or envious principles? *Collier on Kindness.*

* *GENESAN,* a town in Asia Minor, in the
 Arabian Irak, 90 miles *East.*

(1.) * *GENESIS.* *n. f.* [from *genesis,* French]
 creation; the first *book,* which treats
 of production of i.

(2.) *GENESIS,* the first book of the *Old*
 Testament, contains the history of the creation
 the lives of the first patriarchs. This book
 is at the head of the Pentateuch. Its author
 is supposed to be Moses: it contains the relation
 of events, viz. from the beginning of the
 world to the death of Joseph.—The Hebrews call
 it *sebitb,* because it begins with that word
 in their language signifies "in the beginning."
 The Greeks gave it the name *genesis,* g. d
 tion or generation, because it begins with
 the story of the production or generation of
 the world. This book, besides the history of the
 world, contains an account of the original inno-
 cence of man; the propagation of mankind;
 the fall of man; the general defection and
 corruption of the world; the deluge; the restora-
 tion of the world; the division and propelling of
 the world; the history of the first patriarchs to
 Joseph. It was easy for Moses to be
 acquainted with the truth of what he relates in this
 book, because it came down to him through
 tradition from Adam to Noah there was one
 Methuselah, who lived so long as to
 be both: in like manner Shem converted
 Abraham; Isaac with Abraham and
 Jacob from whom the facts recorded in this
 book may be conveyed to Moses by Amos
 was contemporary with Joseph.

(3.) *GENESIUS,* in geometry, denotes
 the formation of a line, plane, or solid, by the
 motion or flux of a point, line, or surface. *See*
GENESIS. The genesis or formation, of the
 globe or sphere, is conceived by sup-
 posing a semicircle to revolve upon a right line
 from one extreme thereof to the other,
 as an axis, or axis of circumvolution: the
 revolution of that semicircle is the genesis
 of the sphere, &c. In the genesis of figures,
 a line or surface that moves is called the *axis*
 and the line round which, or, according
 to the revolution or motion is made, the *axis*

GENESIUS, Joseph, a Greek historian
 flourished about A. D. 940. He wrote
 the history of Constantinople from Leo to Basilus
 and Latin. It was printed at Venice in

(1.) *GENESSEE,* a large tract of land

To ride *a-la-genette*, is to ride after the
ion, so short that the spurs bear upon
flank.

EIL, a town of France, in the dep. of
Loire, $7\frac{1}{2}$ miles N. of Baugé.

HLIA, in antiquity, a solemnity kept
of some person deceased.

ETHLIACAL. *adj.* [*γενεθλιακός*.] Per-
taining to nativities as calculated by astronomers;
configurations of the stars at any birth.
t immediately before he was slighting
those foolish astrologers, and *genethliaci-*
rists, that use to pry into the horoscope
Howel.

ETHLIACI, in astrology, [from *γενεθλια*,
creation, or nativity,] persons who e-
rpes, and pretend to foretel what shall
by means of the stars which presided
ity. The ancients called them CHAL-
LATHEMATICI. Hence the several ci-
on laws, made against mathematicians,
t the *genethliaci* or astrologers. They
ed Rome by a formal decree of the se-
yet found so much protection from the
the people, that they remained there-
ed. Hence an ancient author speaks
boninum genus, quod in civitate nostra
etabitur & retinebitur.

ETHLIACKS. *n. s.* [from *γενεθλια*.]
: of calculating nativities, or predict-
re events of life from the stars predom-
he birth.

ETHLIATICK. *n. s.* [*γενεθλια*.] He who
nativities.—The truth of astrological
is not to be referred to the constella-
genethliaticks conjecture by the disposi-
er, and complexion of the person.

TE, in zoology. See VIVERRA.

ENEVA, a ci-devant republic of En-
e confines of France, Savoy, and Swit-
ng in alliance with the Swiss cantons,
l to France in 1798, in a manner not
rable to the then French government;
sly against the declared opinion and
of a majority of the citizens. It now
epartment of LAC LEMAN. It com-
extent of about 7 square leagues, and
into 9 parishes before its annexation
th republic. The country is extreme-
, and has many magnificent views, a-
the different positions of the numerous
ountains with regard to the town and
inhabitants were formerly divided in-
viz. citizens, burgeses, inhabitants,
; and on the revolution in 1782, a 5th
domicilii, were added, who annually

ges; and the *natives* were the sons of these inha-
bitants, who possess additional advantages.

(2.) GENEVA, a city of Switzerland, on the
confines of old France and the ci devant duchy of
Savoy, now annexed to the French republic, and
capital of the department of Lac Lemman. It is
seated on the banks of the Rhone, just at its efflux
from the lake of Geneva; and part of it is built
on an island in the river. It is handsome, well
fortified, and pretty large; the streets in general
are clean and well paved, but the principal one is
encumbered with a row of shops on each side be-
tween the carriage and foot paths. The latter is
very wide, and protected from the weather by
great wooden pent-houses projecting from the
roofs; which, though very convenient, give the
street a dark and dull appearance. The houses
are generally constructed of free stone, with base-
ments of limestone; the gutters, spouts, ridges,
and outward ornaments, being made of tinned i-
ron. Some of them have arched walks or piazzas
in front. The place called *Treille* is very agreea-
ble, being planted with Linden trees, and com-
manding a fine prospect of the lake, with several
ranges of rocks rising behind one another, some
covered with vineyards and herbage, and others
with snow, having openings between them. Im-
mediately below Geneva the Rhone is joined by
the Arve, a cold and muddy stream, rising among
the Alps, and deriving a considerable part of its
waters from the Glaciers. The Rhone is quite
clear, and transparent, so that the muddy water
of the Arve is distinguishable from it even after
they have flowed for several miles together. There
are 4 bridges over the Rhone before it joins the
Arve; and from it the city is supplied with water
by an hydraulic machine which raises it 100 Paris
feet above the level. This city lies 40 miles NE.
of Chambéry, 60 NW. of Lyons, and 135 of
Turin. Lon. 5. 55. E. Lat. 46. 11. N.

(3.) GENEVA, ACADEMY AND LEARNED MEN
OF. This city is remarkable for the number of
larned men it has produced. The reformed doc-
trines of religion were very early received in it,
being preached there in 1533 by William Farel and
Peter Viret of Orbe, and afterwards finally estab-
lished by the celebrated John Calvin. Of this
reformer Voltaire observes, that he gave his name
to the religious doctrines first broached by others,
in the same manner that Americus Vesputius gave
name to the continent of America, which had for-
merly been discovered by Columbus. But Vol-
taire in this, as in many other assertions is wrong.
It was not Calvin that gave his name to the doc-
trines, but the public at large, whereas Vesputi-
us expressly *stole* the honour due to Columbus. It
was by the assiduity of this celebrated reformer,
and the influence that he acquired among the ci-
tizens, that a public academy was first established
in the city, where he, Theodore Beza, and some
of the more eminent first reformers, read lectures
with uncommon success. The intolerant spirit
that formerly prevailed in Geneva is now total-
ly annihilated. The advantages of the academy
at Geneva are very conspicuous among the citi-
zens, even the lower class of them being exceed-
ingly well informed; so that, according to Mr

gh the government was accounted re-
bained an almost absolute authority
ple, and exercised it in a most unjust
y manner. Thus violent commotions
and the citizens became divided in-
ties, one of which, viz. the patriots

Eidgenossen or *confederates*; the party
being disgraced by the appellation
of *flaves*. The true period of Ge-
y may therefore be considered as com-
th the treaty concluded with Berne
in 1526; in consequence of which the
son deprived of his authority, the bi-
from the city, and the reformed reli-
republican form of government intro-
long war commenced with Savoy on
t; but the Genevans proved an over-
their enemies by their own bravery and
of the inhabitants of Berne.

NEVA. HISTORY OF, TO THE ABOLI-
THE GENERAL ASSEMBLIES. In 1584,
concluded a treaty with Zurich and
which it is allied to the Swiss cantons.
of Savoy made their last attempt against
1562, when the city was treacherous
in the night time during a profound
soldiers had scaled the walls, and got
own before any alarm was given; but
repulsed by the desperate valour of a
, who perished in the encounter. A
been fastened to one of the gates by
rds; but the gunner was killed before
discharged. The war occasioned by
ery was next year concluded by a so-
, which has ever since been observed
es; though the independence of Gene-
er formally acknowledged by the king
till 1754. The restoration of tranquil
without, in consequence of the above
however soon followed by the flames
discord, so common in popular go-
so that during the whole of the 17th
history of Geneva affords little more
count of the struggles betwixt the aris-
and popular parties. About the begin-
18th century the power of the Grand
s become almost absolute; but to re-
thority, an edict was procured in 1707
ular party, enacting that every 5 years
council of the citizens and burghers
summoned to deliberate upon the affairs
blic. In consequence of this law, a
mbly was convened in 1712; and the
t of that assembly was to abolish the
ich they had been convened. A pro-
extraordinary can scarcely be account-
e principles of popular fickleness and
. Rousseau, in his Miscellaneous Works,
o the artifices of the magistrates, and
al terms marked on the billets then in
he question being put, "Whether the
he councils for abolishing the periodics
should pass into a law?" the words
or *rejection*, put upon the billets by
otes were given, might be interpreted

Thus, if the billet was chosen on
word *approbation* was written, the opi-
councils which rejected the assemblies

was approved; and by the word *rejection*, the pe-
riodical assembly was rejected of course. Hence
several of the citizens complained that they had
been deceived, and that they never meant to re-
ject the general assembly; but only the opinion of
the councils.

(8.) GENEVA, HISTORY OF, TO THE INSUR-
RECTION IN 1781. In consequence of the aboli-
tion of the general assemblies, the power of the
aristocratical party, was greatly augmented, till
at length, the inhabitants, exerting themselves with
uncommon spirit and perseverance, found means
to limit the power of the magistrates, and enlarge
their own rights. In 1776, as Mr Coxe informs
us, the government might be considered as a
mean betwixt that of the aristocratical and popu-
lar cantons of Switzerland. The members of the
senate, or little council of 25, enjoyed in that
capacity several very considerable prerogatives.
By them half the members of the great council
were named; the principal magistrates were sup-
plied from their own body; they convoked the
great and general councils, deliberating previous-
ly upon every question which was to be brought
before these councils. They were vested also with
the chief executive power, the administration of
finances, and had in a certain degree the jurisdic-
tion in civil and criminal causes. Most of the
smaller posts were likewise filled by them; and
they enjoyed the sole privilege of conferring the
burghership. These, and other prerogatives, how-
ever, were balanced by those of the great council
and the privileges of the general council. The
former had a right to choose the members of the
senate from their own body; receiving appeals in
all causes above a certain value, pardoning crimi-
nals, &c. besides which they had the important
privilege of approving or rejecting whatever was
proposed by the senate to be laid before the peo-
ple. The general council, or assembly of the peo-
ple, was composed of the citizens and burghers
of the town; their number in general amounting
to 1500, though usually not more than 1200 were
present; the remainder residing in foreign countries,
or being otherwise absent. They met twice a-year,
chose the principal magistrates, approved or re-
jected the laws and regulations proposed by the
other councils, imposed taxes, contracted alliances,
declared war or peace, and nominated half the
members of the great council, &c. But the prin-
cipal check to the power of the senate arose from
the right of *re-election*, or the power of annually
expelling 4 members from the senate at the nomi-
nation of the *syndics* or principal magistrates, and
from the right of representation. The *syndics*
were 4 in number, chosen annually from the se-
nate by the general council; and 3 years elapsed
before the same members could be again appoint-
ed. In choosing these magistrates, the senate ap-
pointed from its own body 8 candidates, from
whom the 4 *syndics* were to be chosen by the ge-
neral council. The latter, however, had it in
their power to reject not only the first 8 candi-
dates, but also the whole body of senators in suc-
cession: in which case, 4 members of the senate
retired into the great council; and their places
were filled by an equal number from that council.

to the power of representation, every citizen had the privilege of applying to the senate to procure a new regulation in this respect or of remonstrating against any act of the magistracy. To these remonstrances the magistrates were obliged to give an explicit answer; for if a satisfactory answer was not given to one, a second was immediately presented. The representation was made by a greater or smaller number of citizens according to the importance of the point in question. Since 1776, however, several changes have taken place. This right of *re-election*, which the aristocratical party were obliged to yield to the people in 1768, soon proved very disagreeable, being considered by the former as a kind of ostracism; for which reason they caught at every opportunity of procuring its abolition. They were now distinguished by the title of *negatives*, while the popular party had that of *representants*; and the point in dispute was the compilation of a new code of laws. This measure the negatives opposed, as supposing that it would tend to reduce their prerogatives; while, on the other hand, the *representants* used their utmost endeavours to promote it, in hopes of having their privileges augmented by such means. At last in January 1777, the negatives were obliged to comply with the demands of their antagonists; and a committee for forming a new code of laws was appointed by the concurrence of the little, great, and general councils. The committee was to last for two years, and the code to be laid before the three councils for their joint approbation or rejection. A sketch of the first part of the code was presented to the little and great councils on the 1st. Sept. 1779, that they might profit by their observations before it was presented to the general council. Great disputes arose; and at length it was carried by the negatives that the code should be rejected and the committee dissolved. The opposite party complained of this as unconstitutional, and violent disputes ensued; the issue of which was, that the great council offered to compile the code, and submit it to the decision of the public. This did not give satisfaction to the popular party, who considered it as insidious; the contentions revived with more fury than ever, until at length the negatives supposing, or pretending to suppose, that their country was in danger, applied to the guarantees, France, Zurich, and Berne, intreating them to protect the laws and constitution. This was productive of no good effect; so that the negatives found no other method of gaining their point than by sowing dissension among the different classes of inhabitants. The *natives* were discontented and jealous on account of many exclusive privileges enjoyed by that class named *citizens*; they were besides exasperated against them for having, in 1770, banished 8 of the principal natives, who pretended that the right of burghership belonged to the natives as well as to the citizens, and demanded that this right should be gratuitously conferred instead of being purchased. The negatives, in hopes of making such a considerable addition to their party, courted the natives by all the methods they could think of, promising a public declaration, that they were ready to upon them those privileges of trade and

commerce which had hitherto been confined solely to the citizens. The designs of the negatives were likewise openly favoured by France, and dispatches were even sent to the French resident at Geneva, to be communicated to the principal natives who sided with the aristocratic party. The attorney general, perceiving this mode of interference to be unconstitutional, presented a spirited remonstrance by which the French court were so mortified, that they procured his deposition from office; and thus their party was very much increased among the natives. The *representants* endeavoured to conciliate the former party, and even promised what hitherto opposed in the strongest manner to facilitate the acquisition of the burghership to bestow it as the recompense of good behaviour. Thus two parties were among the natives themselves; and the becoming every day worse and worse, insurrection took place on the 31st Feb.

(9.) GENEVA, HISTORY OF, TO REVOLUTION IN 1782. A dispute, accompanied with violent reproaches, having commenced between two neighbouring and opposite parties, a battle would have immediately taken place, if not been for the interposition of the one side, and the chiefs of the other on the other. The tumult was begun on the 1st side, when a discharge of musquetry from the arsenal. Some young men, with the negatives, having taken possession of the arsenal, had fired by mistake upon some of their own party, and had killed one and wounded another. This was considered by the *representants* as the signal for a general insurrection, on which they instantly took up arms and marched in 3 columns to the arsenal; but there only a few young men who had rashly followed their orders, they permitted the rest to retire unmolested. In the opinion of some people, however, this affair was preconcerted, and the *representants* are said to have been the first aggressors having thus taken up arms in haste to lay them down. They took possession of all the avenues to the city; and their being summoned next morning by the fulfilment of their engagements with respect to the ship, they held several meetings with the negatives on that subject, but without success, tho' the latter readily agreed to an augmentation of the commercial privileges of the native burghership. The committee, however, at the number and threats of the natives, set up an edict, permitting the natives to trade, and to hold the rank of officers in military associations; and conferred the burghership on more than 100 persons, taken from the natives and inhabitants, and even from the peasantry. This was approved by the negatives not daring to make their own. Thus the popular party imagined, that they had got a complete victory; but they soon found themselves deceived. They were prevailed upon by deputies from Zurich and Berne, who sent to conciliate the differences, to lay

this was no longer done, than the
declared the edict in favour of the
be null and illegal. The senate de-
fines of the same opinion; and main-
the affect of the council had been
by through fear of the representatives
under arms, and whom none at that
people. The representatives, exaspera-
renewed proceeding, presented an-
franchise on the 18th March, 1783, sum-
magistrates once more to confirm the
month afterwards received the letter
that "The government was neither
able to confirm it." The natives,
themselves disappointed in their favourite
very time they had such strong hopes
it, behaved like frantic people, and
tumult took place. The most mode-
popular party endeavoured in vain to
ry, by dispersing themselves in different
the city; and the citizens, finding
last obliged either to abandon the
natives or to join them openly, hasty-
the latter measure; after which, so
now oppose them, the officers of the
s took possession of the town, and
insurrection. Various negotiations
l on with the natives, to prevail up-
ratify the edict, but without success:
few of the magistrates were confined

of disengagement forebaw that all resist-

of necessity of surrendering, at the thoughts of the people of the city, and even of general emigration. A ship to be delivered to the city, the chiefs summoned the pri-ers from their posts, ordered the cannon batteries to be rendered unfit for service, and at last took care of themselves by quitting the town. The people were in the utmost despair; and left the town in such multitudes, that when the Sardinians entered it in the morning, they found it almost deserted. This was followed by the restoration of the former magistrates, a complete subjection of the popular party, and the establishment of a military government.

(10.) GENEVA, HISTORY OF, TO THE REVOLUTION IN 1789. The changes which took place on this occasion were as follow: 1. An abolition of the right of re-election. 2. The abolition of that right by which the general council nominated half the vacancies in the great council. 3. The right of remonstrating was taken from the citizens at large, and vested in 36 adjuncts, who might be present in the great council the first Monday of every month. They enjoyed a right of representation, and in consequence of that had a deliberative voice; but on the whole, were so insignificant, that they were nicknamed *Les Images*, or "The shadows." 4. The introduction of the *grabeau*, or annual confirmation of the members of the senate and of the great council, vested entirely in the latter. By this law part of the authority both of the senate and general council was transferred to the great council; and by subjecting the senate to this annual revision, its power was greatly lessened, and it was made in fact dependent upon the general council. 5. The circles or clubs in which it was customary to convene the citizens, and all public assemblies whatever, were prohibited: and so rigorously was this carried into execution, that even the *Society of Arts* were prohibited from meeting. 6. The militia were abolished; firing at marks, even with bows and arrows, was prohibited, and the town, instead of being guarded by its own citizens, was now put under the care of 1000 foreign soldiers, whose colonel and major were both to be foreigners. These troops were to take an oath of fidelity to the republic, and of obedience to the great council and the committee of war; but were under the immediate command and inspection of the latter, and subject to the superior control of the former. 7. No person was permitted to bear arms, whether citizen, native, or inhabitant. 8. Several taxes were imposed without the consent of the general council; but in time to come it was provided, that every change or augmentation of the revenue should be submitted to that body. 9. Several privileges with regard to trade and commerce, formerly possessed by the citizens alone, were now granted to both citizens and inhabitants. It was not to be expected, that this constitution would be agreeable to people who had such a strong sense of liberty, and had been accustomed to put such a value upon it, as the Genevans. From what

has been already related, it might seem to conclude, that an almost universal emigration would have taken place; but after the excitement had time to subside, most of the fled at first, returned; and, in the opinion of Coxe, not more than 600 finally left the town on account of the revolution in 1783. The Genevans principally settled at Brussels and Cologne, where they introduced the arts of printing and watch making. Soon after the revolution, indeed, a memorial, signed by above 1000 persons of both sexes, all either possessing property, or versed in trade or manufacture, was presented to the earl of Temple, then lord lieutenant of Ireland, expressing a desire to that kingdom. The proposal met with approbation; the Irish parliament voted towards defraying the expences of their emigration, and affording them a proper settlement in the island. Lands were purchased for 800000, in a convenient situation near Waterford; but the scheme was actually completed at the end of 1800; a charter was granted with considerable privileges; the standard of gold was altered for the accommodation of the watch makers; and the foundation of an academy upon an useful and liberal plan. Seven Genevans landed in Ireland, in July 1783; but the nation had expended nearly 30,000 on the scheme, it was suddenly abandoned. It principally to have been owing to the necessity occasioned in the execution of a complicated plan; and in some degree a high demand of the Genevan commission required many privileges inconsistent with the constitution of Ireland. By these delays the Genevans induced to abandon the scheme, and their former place of residence. Ever since who had already landed, though mainly at the public expence, were discontented at being the new town prepared for their residence, and as those among the proposed emigrants possessed the greatest share of property ready withdrawn their names, the remainder not choose to remain in the country which had not capital sufficient to carry on any considerable trade or manufacture. A petition presented by the Genevan commissioner, requesting that 10,000l. of the 50,000l. voted appropriated to the forming a capital; had been voted for other purposes, it was of course rejected: in consequence the Genevans relinquished the settlement, and soon after quitted the island. The people of Old Geneva, though returned to their former place of abode, were far from inclined to submit to the yoke with patience; they were obliged to pay heavy taxes to maintain a military force to keep themselves in subjection; so intolerable did this appear, that in every thing seemed ready for another revolution. The success of this seemed more probable than that of the former, as France was not in a condition to interfere as formerly. The ferment soon rose to such a height, that the government was obliged to call in the aid of troops to quell a tumult which happened in the

duced only a temporary tranquillity; an-
 tumult took place on the 26th of Jan. 1789,
 out of the publication of an edict raising
 of bread a farthing per pound. On this
 the instantly rose; plundered the bakers
 and next day a carriage loaded with bread
 led by soldiers was plundered in its way
 to the distribution office. The soldiers fired on
 it, by which one man was killed and an-
 wounded: but the tumult still increasing,
 the soldiers were driven away; and the body of
 the dead was carried in a kind of procession
 to the town house, as a proof of the violence
 of the aristocratic party. The magistrates
 in the mean time, spent their time in
 doing nothing, instead of taking any effectual me-
 sures for quelling the insurrection. The citizens,
 on the other hand, attacked and carried two of
 the fortifications, dangerously wounded the commanding
 officer, and he attempted to allay the fury of both
 parties. At last the magistrates dispatched against
 the insurrection a considerable body of troops, whom they
 thought the insurgents would not have the courage
 to resist, but in this they were mistaken. The
 soldiers had formed a strong barricade, behind
 which they played off two fire-pumps, filled with
 water and soap lyes, against the extremities
 of the houses which the military had to cross be-
 cause they could not attack them. The commanding
 officer was killed and several of his men wounded.
 A discharge of small arms from windows;
 stones of the pavement were carried up to
 the roofs of houses to be thrown down upon the
 soldiers; they should force the barricades and
 enter the streets. The tumult, in the
 evening, continued to increase, and was in dan-
 ger of becoming universal; when the magistrates,
 seeing it would be impossible to quell the insur-
 rection without a great effusion of blood, were re-
 luctant to the necessity of complying with their
 demands.

One of the principal magistrates re-
 ceived a person to the quarter of St Gervais,
 and issued an edict for lowering the price of
 bread, granted a general amnesty, and releas-
 ed the insurgents who had been taken into
 custody.

Thus a momentary calm was produ-
 ced. The leaders of the insurrection, sensible
 that the magistrates were either unable or unwill-
 ing to employ a sufficient force against them, re-
 took advantage of the present opportu-
 nity to procure a full change of government.
 The insurrection, therefore, took place on the
 30th of the month, in which the soldiers were
 removed from their posts, disarmed, and the gates
 were opened to the people. The magistrates then, con-
 sidering that all opposition was fruitless, deter-
 mined to comply with the demands of their anta-
 gonists to their full extent: and the aristocratical
 party, suddenly changing their sentiments, renoun-
 ced that system to which they had
 so obstinately adhered. On the applica-
 tion of the solicitor-general, therefore, for the re-
 storation of the ancient liberties of the people, the
 edicts of bearing arms, re-establishment of the
 rights of their circles or political clubs, the
 removal of the garrison from the barracks, and
 the release of the representants who were banished
 these moderate demands were received

with complacency, and even satisfaction. The
 preliminaries were easily settled, and a new edict
 of pacification was published under the title of
Modifications à l'Édition de 1782, and approved by
 the senate, great council, and general council.
 So great was the unanimity on this occasion, that
 the modifications were received by a majority of
 1321 against 52. The pacification was instantly
 followed by marks of friendship betwixt the two
 parties which had never been experienced before:
 the sons of the principal negatives frequented the
 circles of the burghers; and the magistrates ob-
 tained the confidence of the people, by dismissing
 the military, evacuating the barracks, and devo-
 ting them to the use of the university and public
 library. In a word, the constitution established
 in 1789, gave general satisfaction, as a just me-
 dium between the too democratic form established
 in 1768, and the too aristocratic one established in
 1782. The history of the republic from this period
 to its union with France, being necessarily connec-
 ted with that of the French revolution, will be
 noticed under that article. See REVOLUTION.

(II.) GENEVA, INHABITANTS OF. The city
 is by far the most populous in Switzerland, con-
 taining about 30,000 inhabitants, of whom, how-
 ever, 5000 are generally supposed to be absent.
 The district dependent upon it does not contain
 above 16,000. The people are very active and
 industrious, and carry on an extensive commerce.

(II.) GENEVA, LAKE OF. This lake, which
 was anciently called LEMANUS, (whence the pre-
 sent name of the department, LAC LEMAN,) is in
 the shape of a crescent; along the concave side
 of which Mr Coxe travelled 54 miles, Switzerland
 forms the concave, and the department of Mont
 Blanc, (the ci-devant Savoy,) the convex part;
 the greatest breadth being about 12 miles. The
 country on the side of Mont Blanc is full of high
 and craggy mountains; but from Geneva to the
 environs of Lausanne it slopes to the margin of
 the lake, and is very rich and fertile. The banks
 rise considerably in the neighbourhood of Lausanne,
 and form a most beautiful terrace, with a rapid
 descent a few miles beyond the town. A plain
 begins in the neighbourhood of Vevay, which
 continues for a great way beyond the end of the
 lake, but contracts towards the water by the ap-
 proach of the mountains. The lake itself appears
 at a distance of a beautiful blue colour, and the
 water is very clear and transparent. Near Gene-
 va the coast abounds with pebbles; between that
 city and Lausanne it is sandy; from thence to
 Chillon it is bounded by hard calcareous rocks;
 and the extremity of the shore is a marsh formed
 by mud collected from the Rhone. The great-
 est depth of this lake, found by M. de Luc, is
 160 fathoms. Here the birds called *tippet grebes*
 appear in December; but retire in February to
 other places where they breed, and make float-
 ing nests of reeds, as the lake of Geneva affords
 none. This lake, like all others situated between
 mountains, is subject to sudden storms. The
 Rhone runs through its whole extent from its E.
 to its SW. extremity; after which it passes through
 the city and divides it into two unequal parts.

(III.) GENEVA, a lake of Upper Canada, which
 forms

forms the W. extremity of Lake Ontario, to which it is joined by a short and narrow strait.

(IV.) GENEVA, a post town of New York, in Onondago county, at the NW. corner of Lake Seneca, on the road from Albany to Niagara: 74 miles W. of Oneida castle, and 460 NW. by N. of Philadelphia. Lon. 1. 40. W. of that city. Lat. 42. 49. N.

(V. i.) * GENEVA. *n. f.* [A corruption of *genève*, French, a juniper berry.]—We used to keep a distilled spirituous water of juniper in the shops. At present only a better kind is distilled from the juniper-berry: what is commonly sold is made with no better an ingredient than oil of turpentine, put into the still, with a little common salt and the coarsest spirit. *Hill's Mat. Med.*

(ii.) GENEVA, or GIN, is an ordinary malt spirit, distilled a second time, with the addition of some juniper-berries. Originally, the berries were added to the malt in the grinding; so that the spirit thus obtained was flavoured with the berries from the first, and exceeded all that could be made by any other method. At present, they leave out the berries entirely, and give their spirit a flavour by distilling them with a proper quantity of oil of turpentine; which, though it nearly resembles the flavour of juniper-berries, has none of their valuable virtues.

(VI.) GENEVA, DUCHY OF. See GENEVOIS.

(VII.) GENEVA, NEW. See N° I. § 10.

GENEVANS, the people of GENEVA.

GENEVES, the territory of Geneva. See GENEVA, N° I. § 1.

(I.) GENEVIEVE, St, the patroness of the city of Paris, flourished in the end of the 3th century, and died A. D. 512. Five years after her death, Clovis erected the church of St Genevieve, under the name and invocation of St Peter, where her relics, are, or were till lately, preserved, her shrine visited and her image carried with great processions and ceremonies.

(2.) GENEVIEVE, St, fathers or religious of, a congregation of regular canons, established in France, in the 17th century. It was a reform of the Augustine canons, begun by St Charles Faure, in the abbey of St Vincent de Senlis, in 1618. In 1634, the abbey was made elective; and a general chapter, composed of the superiors of 15 houses, who had received the reform, chose F. Faure coadjutor of the abbey of St Genevieve, and general of the congregation. It increased very much, and before the abolition of monachism, consisted of above 100 monasteries; in some of which the religious were employed in the administration of the parishes and hospitals; and in others, in the instruction of ecclesiastics. It took its name from the abbey of St Genevieve, which was the chief of the order, and whose abbot was the general. The abbey itself was named from the Saint. See N° 1.

(3.) GENEVIEVE, St, or MISSIRE, a village of Louisiana, on the Mississippi, opposite Kaskaskias, 12 miles from Fort Chartres.

GENEVILLIERS, a town of France in the dep. of Paris, 2 miles W. of St Denys.

GENEVOIS, or the DUCHY OF GENEVA, a ci-devant province of France, bounded on the N. by Switzerland, on the E. by Faucigny, on the

S. by Savoy Proper, and on the W. by the ci-devant province of Dauphiné. Anciently Geneva and its territory in it. It is now annexed to France in the department of Mont Blanc.

GENEURO, a mountain betw and the ci-devant province of Dauphiné, Briançon and Sufa.

GENGENBACH, an imperial city, many, in Suabia, on the Kinzig; of Strassburg, and 21 N. of Friburg.

GENGIS KHAN, the renowned the Moguls, a barbarous and bloody conqueror. See JENGHIZ KHAN, and MOGULS.

GENGOUX, St, ci-devant Le R. France in the department of Saône and ci-devant prov. of Burgundy, wines; seated on a mountain 17 Châlons. Lon. 4. 43. E. Lat. 46. 1.

(1.) * GENIAL. *adj.* [genial] That which contributes to propagate.

Higher of the genial bed by far And with mysterious reverence I

Creator Venus, genial pow'r o The bliss of men below and gods

2. That gives cheerfulness or support

Nor will the light of life continue

But yields to double darkness night

So much I feel my genial spirits

3. Natural; native.—It chiefly denotes natural incapacity, and genial indisposition.

(2.) GENIAL GODS, in the Pagan religions who were supposed to preside

ration. The genial gods, says Festus,

air, fire, and water. The twelve

with the sun and moon, were sometimes

ed in the number.

* GENIALLY. *adv.* [from genial.]

naturally.—Some men are genially disposed

opinions, and naturally averse to others

2. Gayly; cheerfully.

* GENICULATED. *adj.* [geni-

Knotted; jointed.—A piece of

plant seeming to be part of a sugar-

on *Festus*.

* GENICULATION. *n. f.* [geni-

Knottiness; the quality in plants of

or joints.

GENIEZ, St, a town of France

of Aveiron, and late prov. of Rouergue

the birthplace of Abbe Raynal, an

NE. of Rhodéz. Lon. 3. 6. E. Lat.

GENII, in the Mahometan theol-

intermediate beings, supposed to

men and angels. They are of a grade

the latter, but much more active

than the former. Some of them are

bad, and they are capable of future

damnation like men. The Orientals

these geni inhabited the world 5

years before the creation of Adam,

princes, who all bore the common name

of Eblis; that falling at length into an

corruption, Eblis was sent to dwell

remote part of the earth, there to

and that some of that generation

were by Tahmurath, one of the an-

Persia, forced to retreat into the

of Kaf. Of this king's success

so many fabulous and romantic stories. We suppose several ranks and degrees of species among this kind of beings; peculiarly called *Jins*, or *genii*; some *ies*; some *Divs*, or giants; and others *fates*.

E, a town of France in the dep. of oire, 3 miles N. of Loches.

G. n. f. [*genus*, Italian; *genius*, Latin.] particular turn of mind.—Some *genius* able of pure affection; and a man is ilents for it as much as for poetry, or ience. *Tatler*.

ILLOSSI, and } in anatomy. See **A-VOIDSUS**, } **ANATOMY**, § 301.

TOMA, in botany, a genus of the order, belonging to the pentandria class. The calyx is a turbinate quinquefid; the corolla monopetalous and tubulosa; short filaments; the anthera seeds very numerous and subangulate in a filiform receptacle.

A, in botany, a genus of the monogynous order, belonging to the pentandria class of in the natural method ranking under *Contortae*. The corolla is wheel-stigma club-shaped; the berry bilobed, red, and fleshy.

ST GENIS, a town of the French dep. of Mont Blanc, and ci de Savoy, on the Oulier; 12 miles W. Lon. 5. 30. E. Lat. 45. 40. N.

A, **AROM**, or **DYERS-WEED**, a genus of the diadelphia order, belonging to the diadelphia plants; and in the natural method to the 3rd order, *Papilionaceae*. The blade, the upper lip bidentate, the identate; the vexillum is oblong and turned back from the pistil and stamens several species; of which the following are most remarkable:

A CYTISUS, or **CYTISO GENISTA**, a common shrub; which is too well known to need description. Its young flowers are formed as pickles; and the plant, when dried, is a tolerably pure alkaline salt. Dr. Sydenham, in the case of a dropsical patient, who was taking half a pint of a decoction of tops, with a spoonful of whole white wine every morning and evening. The decoction had been tapped three times, and tried several times before. An infusion of the tops, freely, has been known to produce effects. Cows, horses, and sheep, eat it.

A TINCTORIA is also a native of the sea with shrubby stalks 3 feet high, spear-shaped leaves placed alternately, and by several spikes of yellow flowers, pods. The branches are used by the sailors for a yellow colour; from whence it is called *broom*, *green wool*, *wood waxen*.

A dram and a half of the powder makes a mild purgative. A decoction of the plant is diuretic; and, like the powder, is serviceable in dropsical cases. *Gouts*, and *sheep, eat it*.

T. L.

(1.) * **GENTILIS**. *n. f.* [*genialis*, Lat.] Part belonging to generation.—Hiam is conceived to be Jupiter, who was the youngest son, who is said to have cut off the *genitals* of his father. *Brown*.

(2.) **GENITALS**. See **ANATOMY**, *Index*. **GENITE**, a town of France, in the dep. of Corrèze, 18 miles W. of Brive.

GENITES, among the Hebrews, those descended from Abraham, without any mixture of foreign blood. The Greeks distinguished by the name of *genites* such of the Jews as were issued from parents, who during the Babylonish captivity, had not allied with any gentile family.

* **GENITING**. *n. f.* [A corruption of *Janeton*, French, signifying *Jane* or *Janet*, having been so called in honour of some lady of that name; and the Scottish dialect calls them *Janet* apples, which is the same with *Janeton*; otherwise supposed to be corrupted from *Janetling*.] An early apple gathered in June.—In July come early pears and plums in fruit, *genittings* and *codlins*. *Bacon*.

(1.) * **GENITIVE**. *adj.* [*genitivus*, Latin.] In grammar, the name of a case, which, among other relations, signifies one begotten, as, the father of a son; or one begetting, as son of a father.

(2.) **The GENITIVE**, is the second case of the declension of nouns. The relation of one thing considered as belonging in some manner to another, occasioned in the Greek and Latin, a peculiar termination of nouns called the *genitive case*; but in the modern tongues a particle is prefixed to express the relation of this case. In English we prefix the particle *of*; in French *de* or *du*, &c. though in strictness there are no cases in either of these languages; inasmuch as they do not express the different relations of things by different terminations, but by prepositions.

(1.) * **GENIUS**. *n. f.* [Latin; *genie*, French.] 1. The protecting or ruling power of men, places, or things.—

There is none but he

Whose being I do fear: and, under him,
My *genius* is rebuk'd; as it is said
Antony's was by Cæsar. *Shak. Macbeth.*

The *genius* and the mortal instruments
Are then in council; and the state of man,
Like to a little kingdom, suffers then. *J. Cæf.*

And as I awake, sweet music breathe,
Sent by some spirit to mortals good,
Or th' unseen *genius* of the wood. *Milton.*

And the tame demon that should guard my throne,

Shrinks at a *genius* greater than his own. *Dryd.*

To your glad *gen.* sacrifice this day;

Let common meats respectfully give way. *Dryd.*
2. A man endued with superior faculties.—There is no little writer of Pindaricks who is not mentioned as a prodigious *genius*. *Addison.* 3. Mental power or faculties.—

The state and order does proclaim
The *genius* of that royal dame. *Waller.*

4. Disposition of nature by which any one is qualified for some peculiar employment.—

A happy *genius* is the gift of nature. *Dryden.*
—Your majesty's sagacity, and happy *genius* for natural history, is a better preparation for enquiries of this kind than all the dead learning of the schools. *Burnet's Theory, Preface.*

while others are disagreeable, not their strict regularity. The genius, says Abbe Du Bos, consists in a command of the organs of the brain; in motion of each of these organs; as purity of the blood, which disposes it, during exercise, so as to furnish it to the springs employed in the imagination. Here he supposes poster's blood is heated; for that poets cannot invent in cool blood; so evident they must be wrapt into a passion when they produce their finest. He mentions a poet who never wrote ten his poetic fury hurried him into frenzy. The admirable pictures in *Orinda* and *Clorinda* are alleged by some to be drawn at the expence of a disposition to real madness, into which he fell. "Do you imagine," says Cicero, "he wrote in cold blood? No, it was not. He must have been inspired with a power to be able to write such admirable

a town of France, in the department of 7 miles N. of Chauny.

NADIUS, patriarch of Constantinople, succeeded Anatolius in 458, was esteemed author; but all his works are lost, except a little against Simony, and part of a book *St Cyril's Anathemas*. He died

NADIUS, a bishop or priest of Marburg, wrote a work *De Dogmatibus Ecclesie*. It has been ascribed to St Augustin, among his works. He wrote another *Ecclesie Scripturibus*. Both are extant in 492.

a town of France, in the department of Loire, near the Loire, 9 miles NW.

2, a town of Germany in the late times, now annexed to the French Republic, included in the dep. of the Roer. It is on the Niers, near the Meuse, and 9 miles.

3, a town of France in the dep. of Ille, 5 miles NE. of Guerche.

NESARETH, in ancient geography, a town of Galilee, called also Cinnereth, *Cbinnereth*, by Moses; 140 stadia in length, 10 in breadth; abounding in fish. It is called the *Sea of Galilee*, and St John *berias*.

NESARETH, a district on the lake.

GENOA, the GENOESSE REPUBLIC, or the REPUBLIC, a small democratic state of Italy, lying along that part of the Mediterranean from it is called the *Gulf of Genoa*, 2 miles, but varying in its breadth from 1 to 2 miles. It is bounded on the N. from Piedmont, Montferrat, the Cisalpine Republic, Parma, a small territory belonging to the republic of Lucca. This part of the ancient LIGURIA, whence the name of the LIGURIAN REPUBLIC. It is 11. 27. and 9. 25. Lon. E. and between 45. 0. Lat. N.

(2.) GENOA, the capital of the Ligurian republic, is seated on the coast of the Mediterranean sea, at the bottom of the gulph, (§ 4.) partly on the flat, and partly on the declivity, of a pleasant hill; in consequence of which, it appears to great advantage from the sea. Two of the streets consist entirely of a double straight row of magnificent palaces, at least they did so before the late bombardment. The others, though clean and well paved, are crooked and narrow. The palaces of the ci-devant nobility are almost all of marble, and many of them are painted on the outside. Of these there is a vast number besides churches, convents, and hospitals. The palace where the ci-devant doge resided, and where the great and little council, and the two colleges of the procurators and governors assembled, is a large stone building in the centre of the city. It contains some fine paintings in fresco; two statues of Andrew and John Doria in white marble; and an arsenal, in which are said to be arms for 34,000 men, with a shield, containing 120 pistol barrels, and 33 coats of mail, which, it is said, were worn by as many Genoese heroines in a croilade. Of the churches, the finest are those of the Annunciation, St Mary Carignan, St Dominic, and St Martha. In the cathedral is an hexagonal cup made of a single emerald. An academy of painting, sculpture, civil and military architecture, was instituted here in 1751. The streets of Genoa are remarkably steep and narrow, yet one may walk in the night with the greatest safety, which is more than can be said of many cities in Italy. There are two fine stone bridges over the rivers Bonzevera and Bisagno, the first whereof washes the W. and the other the E. side of the city, within which there is also a surprising stone bridge joining two hills. The harbour, though large, is far from being safe; but no expence has been spared to render it safe and commodious. The wind to which it is most exposed, is the SW. called *Labreccio*. The place where the galleys lie, is called the *Darsena*, where before the revolution there were commonly a great number of Turkish slaves. On a rock, on the W. side of the harbour, is the *fanal* or light-house, a high tower, on the top of which is a lantern, containing 36 lamps. Genoa lies 62 miles SE. of Turin, 63 S. of Milan, and 224 NW. of Rome. Lon. 8. 41. E. Lat. 44. 25. N.

(3.) GENOA, CONSTITUTIONS AND GOVERNMENT OF. The ancient constitution, from the time of its establishment by the brave Andrew Doria, in 1528, was aristocratic, though not so much so as that of Venice. The nobility alone were capable of holding the chief offices in the republic. From this body were elected the Doge, the great council and the senate. The doge, or duke, was elected for two years, and was incapacitated from being re-elected for 5 years after; but had a procurator's office assigned him, and a pension of 500 scudi for life. No person could be elected doge till he was 50 years of age, and had left off trade for 15 years before. The great council consisted of 80 counsellors in whom the sovereignty chiefly resided. The senate consisted of 12 senators, who with the doge, had the administration of affairs. In Nov. 1791, this form

of government was overturned, hereditary titles and honours abolished, and a new democratic constitution established, by gen. Bonaparte, with a directory, two councils, &c. similar to the late constitution of France. (See FRANCE, § 61.) At present (Sept. 1800) some farther alterations are making in this constitution, which perhaps will be again new-modelled upon the plan of the present constitution of France, under consuls, &c.

(4.) GENOA, GULF OF, a semicircular gulf of the Mediterranean Sea, which washes the whole S. coast of Genoa, from the coast of the French republic, (ci-devant Nice and Monaco) on the W. to that of Lucca on the E.

(5.) GENOA, HISTORY OF. The ancient history of Genoa, like that of most other places, is wrapt up in fable. Some say, it was built by *Genauus*, a son of Saturn; others by the god *Janus*, agreeably to which origin, the ancient Latin authors often call it *Janua*. Be that as it may, the city of Genoa was a celebrated emporium in the time of the 2d Punic war; and having declared for the Romans, was plundered and burnt by Mago the Carthaginian. It was afterwards rebuilt by the Romans; and with the rest of Italy continued under their dominion till the overthrow of the western empire in 476. In 498, it fell under the power of Theodoric the Ostrogoth; who having defeated the usurper Odoacer, became king of Italy. Not long after, the Goths being almost entirely subdued by Belisarius, Justinian's general, Genoa was re-annexed to the Roman or rather eastern empire. In 670, it was plundered and burnt by the Lombards, whose king Protharius erected it into a provincial dukedom. The Lombards continued masters of Genoa till 774, when they were conquered by Charlemagne. He reduced Liguria to its ancient bound, settled by Augustus, and erected it into a marquise: appointing his relation *Audemarus* the first count or margrave. In 806 the Genoese reduced Corsica. Genoa at this time being distinguished for its wealth and populousness, began to give its name to the whole coast; and continued under the dominion of these counts for about 100 years, till the Carlovingian race became extinct in Italy, and the empire was transferred to the German princes. In 935, while the Genoese forces were absent on some expedition, the Saracens surprised the city, which they plundered and burnt, putting to death a great number of the inhabitants, and carrying others into captivity. Having embarked their captives, together with an immense booty, they set sail for Africa: but the Genoese immediately returning, pursued the invaders; and having entirely defeated them, recovered all the captives and booty, and took a great number of the enemy's ships. About A. D. 950, the Franks having lost all authority in Italy, the Genoese began to form themselves into a republic, and to be governed by their own magistrates, who were freely elected, and took the name of *Consuls*. To support their independence, they applied themselves to commerce and navigation; and being apprehensive that some of the German emperors, who often invaded Italy, might renew their pretensions to their state, they acknowledged Berengarius III, D.

of Friuli, who had been elected emperor by a party of Italian nobles. Berengarius, who had ado to maintain himself in his new dignity, favoured by his concessions to enlarge the number of his adherents: and accordingly confirmed the new republic in all its privileges. After this the Genoese began to extend their commerce from Spain to Syria, and from Egypt to Constantinople; their vessels being fitted for fighting as well as merchandise. Having thus acquired reputation, they were invited in 1017, by the Pisans, who had likewise formed themselves into a republic, to join with them in an expedition against Sardinia, which had been conquered by the Moors. In this expedition they were successful; the island was reduced; but from this time the enmity took place between the two republics, which did not end but with the ruin of the latter. The first war with the Pisans commenced 30 years after the Sardinian expedition, and lasted 18 years; when the contending parties concluded a peace, they sent their united forces against the Moors in Africa, of whom they said to have killed 100,000. The Genoese were very active in the time of the crusades, and took a principal share in the taking of Jerusalem. They also waged considerable wars with the Moors of Spain, of whom they generally got the better. They also prevailed against the neighbouring states; and, in 1230, had enlarged their territories beyond the skirts of the Apennines, so that the rest of Italy looked upon them with an envious eye: but in 1211, the factions which had reigned in the city, notwithstanding all their wealth and power, induced the inhabitants to submit to 20 years to the dominion of the emperor Frederick VII. That emperor, however, died in 1231; and the year he had left soon after to Pisa, upon which the dissensions in Genoa revived with greater fury than ever. In 1240 a quarrel happened between the families of the Spinola and Doria; which came to such a height, that both parties fought in the streets for 24 days without intermission, raised battering engines against each others houses, and fired the city with cannon. At last the Spinola quitted the city, and retired to their territories in the Apennine mountains. The civil war continued till 1255; when, by the mediation of the king of Naples, it was agreed that a lexes should return to the city; the republic should be governed by the king's officers, and all the offices of the state be equally divided between the Guelphs and the Ghibellines, the contending parties. By this ruinous war the coast of Genoa, formerly adorned with gardens and vineyards, was now reduced to the appearance of a barren waste. So great was the desolation, that, according to Petrarch, the spectators sailed along were struck with astonishment and horror. Villani, a contemporary author, says that the losses each party had sustained could have been sufficient to have purchased a kingdom. The Genoese republic being esteemed in his time the richest and most powerful state in Christendom. Stella informs us, that, before the time of the most extravagant profusion and luxury reigned among the Genoese: but that, towards

ny noble families were reduced to indigence that, for about 100 years after, it became a habit for the nobles to live in a plain manner. In 1336, both parties sustained their animosities, sent two fleets of 20 each into the German ocean, to assist E. K. of France, against Edward III. of England. This naval expedition proved the cause of a remarkable revolution in the Genoese state. The sailors accused their officers of withholding them of their pay, proceeded to an insurrection, and, having expelled the admiral and commanders, seized the galleys. Philip, a chosen arbitrator, decided in favour of the sailors, and imprisoned 16 chiefs of the mutiny.

Upon this several of the sailors left the city and returned to Genoa; where they went to the docks, repeating their mutinous complaints, which were eagerly listened to, upon a report that the mutineers were broke upon the city. The factious spirit increased; and at Genoa insisted on having an abbot of their choosing, and 20 of the people, with four of the captains of the republic, as a committee for that purpose. While the multitude patiently expecting their decision, a merchant, a wooden bench, and called out Simon Bucamgrace should be chosen abbot, being instantly echoed by the populace, who first declared *abbot*, then *lord*, and *king*, of Genoa. But the dissensions continued so violent as ever, notwithstanding the establishment of the new magistracy; and by these perturbations the republic was at last so much weakened, that in 1390, Charles VI. K. of France, made himself Lord of Genoa. However, they were exceedingly impatient of the French yoke; and, in 1412, the duke of Milan obtained his sovereignty. With this situation they were equally displeased, and therefore revolted. In 1458, finding themselves pressed by a powerful fleet and army sent by Alphonso of Naples, they conferred the sovereignty of the city upon Charles VII. of France. But in 1475 they revolted, and, 4 years after, put themselves under the protection of the duke of Milan, whom they revolted in 1478. He then declared himself sovereign of the republic in 1480, in 1499 the city and territories of Genoa were conquered by Lewis XII. of France. The independence of the Genoese was not corrected by this misfortune. They revolted in 1506; but were again subdued by Lewis. In 1512 they revolted; and in 1516, the city was plundered by the Spaniards. In 1528, Andrea Doria, then an admiral in French service, undertook to rescue his country from the dominion of foreign princes, and restore its liberty. He told his countrymen that the French, who had again obtained the sovereignty, had left them only a shadow of liberty, and pretended to protect them from their oppressors. To the nobility he represented the French as suffering the government to be vested in the hands of foreigners less worthy of authority than themselves. Thus he soon formed a strong party, and when almost 3000 of the French garrison carried off by the plague, he ad-

vanced with 500 men. His friend having opened the gates of the city to him, he seized the principal posts, and thus became master of it without drawing his sword. The garrison retired to the forts, where they soon after capitulated, and being driven out of the city, Doria re-established the ancient form of government. See DORIA. The republic has since continued to preserve her liberty, though greatly fallen from her ancient splendor. In 1684, the Genoese having fallen under the resentment of Lewis XIV, the city was almost destroyed by a formidable bombardment. In 1688, it was bombarded by admiral Byng, and forced to capitulate; but the British government had no view of making a permanent conquest of it. In 1713, the emperor Charles VI. sold the town and marquise of Finale to the republic, which 30 years after involved it in a bloody war; for in 1743, the Q. of Hungary having by the treaty of Worms ceded to the king of Sardinia her right to Finale, the Genoese formed an alliance with France, Spain and Naples; and, in 1745, declared war against the K. of Sardinia, who soon made himself master of great part of the state, while several Genoese ports were bombarded by the British, and the city of Genoa was taken by the Imperialists: but after a terrible slaughter they were driven out by the Genoese; who again defeated them in 1747, when they attempted to recover it. In 1730, the island of Corsica revolted from the Genoese, and could never afterwards be reduced by them: for which reason they at last sold it to the French, who in 1770 totally reduced it. See CORSICA. As the revolution that took place in this state in 1797, and the other events that occurred during the present war, will necessarily be noticed under the article REVOLUTION, we shall only mention here, that the city of Genoa, after sustaining a long and severe siege, from the Austrian forces by land, and the British fleet, which blockaded the port by sea, was at last surrendered on the 7th June 1800, by gen. Massena, on the most honourable terms, after suffering the greatest hardships, the garrison having eaten all their horses, and being reduced to the last 3 oz. of "a wretched mixture of bran, oat chaff, and cocoa nut," which they used for bread. Within two or three weeks after, however, the Austrians were obliged to give up the city to the French, a party of whom had been sent to its relief after the victory at Marengo, and were within a day's march of it, when the garrison capitulated.

(6.) GENOA, INHABITANTS OF. The total number of citizens of all ages in this republic is estimated at 150,000. As to their character, the Genoese in general are esteemed crafty, industrious, and inured to labour above the other Italians.

(7.) GENOA, MILITARY FORCE OF. In time of peace the republic usually keep a body of 5000 regular troops; viz. 4000 natives, 200 Germans, 500 Swiss, 300 Italians, and 100 bombardiers; but in war it has about 20,000 troops in all.

(8.) GENOA, PRODUCE OF. This country, though a great part of it is mountainous, and some of that barren, yet produces plenty of excellent fruit, good pasture, wood, garden stuffs, and mulberry trees; with some wine and oil, but little

G E N (46) G E N

little corn. What is wanted of the last, is supplied from Lombardy, Sicily, or Naples.

(9.) GENOA, REVENUE OF. The ordinary revenue of this republic is estimated at two millions per annum.

(10.) GENOA, STRENGTH OF. The city of Genoa is surrounded on the land side with two walls, the outermost of which reaches beyond the mountain, and extends about 10 Italian miles in circumference. It is defended by bastions, and about 500 pieces of cannon are mounted on the outworks. The fortifications towards the sea are also remarkably strong. On the whole it may be pronounced impregnable; for Massena in his letter to Bonaparte said, "had it not been for want of subsistence we would have for ever held out in Genoa."

(11.) GENOA, TRADE OF. The trade of Genoa is chiefly in velvets, damasks, plush, silk, brocades, laces, gloves, sweetmeats, fruits, oil, Parmesan cheese, anchovies, and drugs from the Levant; but the badness of the harbour, and the high price of commodities, greatly check its commerce. In 1751, Genoa was declared a free port for ten years, under certain restrictions: in that called *Porto Franco*, any merchant may have a ware-house, and import or export goods duty-free; but such as are disposed of in the city, or on the continent, are taxed pretty high. The convenient nobility were allowed to trade in the wholesale way; to carry on velvet, silk, and cloth manufactures; and to have shares in merchant ships; and some of them, as the Palavicini, were actually the greatest merchants in Genoa. Another very profitable article of trade carried on is banking, and dealing in bills of exchange.

GENOELS, Abraham, an eminent painter of Antwerp, born in 1640. He excelled in portraits and landscapes.

GENOESE, the people of Genoa. See GENOA, § 6.

GENOLHAC, or GENOVILLAC, a town of France, in the dept. of Gard, 15 m. NW. of Alais.

GENOSA, a town of Naples, in the province of Otranto; 10 miles SE. of Otranto.

GENOUILLAT, a town of France, in the dept. of Creuse; 9 miles W. of Bouffiac.

(1.) GENOUILLE, a town of France, in the dept. of Charente, 10 miles W. of St Jean.

(2.) GENOUILLE, a town of France, in the department of Vienne, 3 miles S. of Civray.

GENSAC, a town of France, in the dept. of Gironde, 9 miles SE. of Libourne.

GENSERIC, king of the Vandals in Spain, a barbarous conqueror of the 5th century. He succeeded his father Godefridus, A. D. 428; defeated Hermenric, king of the Suevi; over-ran all Africa, conquered Barbary, took Carthage, ravaged Sicily, and sacked Rome. See BARBARY, § 3; ROME, &c. He died in 477.

GENSING, in botany. See PANAX.

* GENT. *adj.* [*gent*, old French.] Elegant; soft; gentle; polite. A word now disused.—

Vespasian with great spoil and rage,

Forwasted all: 'till Genuilla *gent*

Persuaded him to cease.

Fairy Queen.
She that was noble, wise, as fair and *gent*,

Cast how she might their harmless lives prefer.

* GENTEEL. *adj.* [*gentil*, French.] 1. Polite; elegant in behaviour; civil.—He had a genteel manner of binding the chains of this king, than most of his predecessors. *Swift to Gay*.—Poets have no notion of genteel comedy, and into the most filthy double meanings, when they have a mind to make their audience merry. *son on Italy*. 2. Graceful in mien.—

So spruce that he can never be genteel. 3. Elegantly dressed.—Several ladies that twice her fortune, are not able to be always genteel, and so constant at all places of pleasure and expence. *Law*.

* GENTEEILLY. *adv.* [from *genteel*] Elegantly; politely.—Those that would be genteelly dressed, need not purchase it at the dear rate of the atheists. *Glanville*.—After a long fatigue of eating and drinking, and babbling, he concludes the work of dining genteelly. *South*. 2. Gracefully.

* GENTLENESS. *n. f.* [from *gentle*.] Elegance; gracefulness; politeness.—He had a genius full of gentleness and spirit, having notwithstanding that was ungraceful in his postures and dress. *Dryden's Dufresnoy*.—Parmegiano has dignified gentleness of modern effeminacy, by uniting it with the simplicity of the ancients, and the severity of Michael Angelo. *Reynolds*. Qualities befitting a man of rank.

GENTIAH, a town of Asia, in the country of Affam; 370 miles E. of Batna.

* GENTIAN. *n. f.* [*gentiane*, French; *gentiana*, Latin.] Felwort or baldmony.—The gentian is large and long, of a tolerably firm texture, and remarkably tough; it has a farinaceous disagreeable smell, and an extremely bitter taste. *Hist. Mat. Med.*—If it be fistulous, and the seed small, dilute it with gentian root. *Hist.*

GENTIANA, GENTIAN, in botany. A genus of the digynia order, belonging to the pentandria class of plants; and in the natural method ranked under the 20th order *Rotaceae*. The corolla is monopetalous; the capsule bivalved and unilocular; there are two longitudinal receptacles. The remarkable species are the following:

1. GENTIANA CENTAUREUM, the lesser gentian of the shops, is a native of many parts of Britain. It grows on dry pastures; and its height is commonly proportioned to the goodness of the soil, as in rich soils it grows to the height of 4 feet, but in poor ones not above 3 or 4 inches. It is an annual plant with upright branching stems, garnished with small leaves, placed by pairs. The flowers grow in form of an umbel at the top of the stalk, and are of a bright purple colour. They come out in July, and the seed ripens in autumn. The plant cannot be cultivated in gardens. The tops are an useful aperient bitter, in which they are often used in the present practice of medicine.

2. GENTIANA LUTEA, the common gentian of the shops. It is a native of the mountainous parts of Germany; whence the roots, the chief part used in medicine, are brought to this country. These have a yellowish brown colour,

of taste. The lower leaves are of an oval shape, a little pointed at the end, yellowish green, and have 5 large veins each of each. The stalk rises 4 or 5 feet, clothed with leaves growing by pairs at almost embracing the stalk at their base. The upper leaves of the same form with the lower, but gradually in their size to the top. The flowers are out in whorls at the joints on the upper part of the stalks, standing on short footstalks, in the axils of the wings of the leaves. They are yellow colour. The roots of this are often used in medicine as stomachic bitters, but they are less exceptionable than the substances of this class. Infusions of it flavoured with orange peel, are successful. Some years ago a poisonous fungus was discovered among the gentian brought from the East; the use of which occasioned violent and in some cases death. This root is distinguished from the gentian, by its being of a white colour, and void of bitterness. *TIANELLA. n. f.* A kind of blue co-

GENTILE. n. f. [*gentilis*, Latin] 1. uncircumcised nation; one who knows not God.—Tribulation and anguish upon that doleful evil, of the Jew first, and almost all the Gentiles. *Rom. ii. 2.*—*Gentiles* or infidels, heathens, upon both the spiritual and temporal, have been in one pursuit conjoined. A person of rank. Obsolete.—*GENTILE. n. f.* [*gentilis*, Latin] 1. uncircumcised nation; one who knows not God.—Tribulation and anguish upon that doleful evil, of the Jew first, and almost all the Gentiles. *Rom. ii. 2.*—*Gentiles* or infidels, heathens, upon both the spiritual and temporal, have been in one pursuit conjoined. A person of rank. Obsolete.—

ter, born at Pisa in 1563. After painting with great reputation at Florence, Rome, Genoa, and other parts of Italy, he removed to Savoy, thence to France, and at last came over to England, upon the invitation of Charles I.; who appointed him lodgings in his court, with a considerable salary; and employed him in his palace at Greenwich, and other public places. The most remarkable of his performances in England, were the ceilings of Greenwich and York house. He did also a Madonna, a Magdalen, and Lot with his two daughters, for king Charles. After the death of the king, when the royal collection was sold, nine of these pictures drew 600 l. His most esteemed work abroad was the portico of cardinal Bentivoglio's palace at Rome. He made several attempts in face-painting, but with little success; his talent lying altogether in histories, with figures as big as the life. After 12 years continuance in England, he died in 1647, aged 84; and was buried in the Queen's chapel at Somerset house. His head was drawn by Vandyke.

(2.) *GENTILESCHI*, Artemisia, daughter of the preceding, was little inferior to her father in painting history, and excelled him in portraits. She drew some of the royal family, and many of the nobility.

* *GENTILESSA. n. f.* [Fr.] Complaisance; civility. Not used.—

She with her wedding-cloaths undressed
Her complaisance and gentilesses. *Hudibras.*

(1.) *GENTILIS*, Albericus, professor of civil law at Oxford; an Italian by birth. He quitted Italy with his father, on account of religion. He wrote several works; 3 books in particular, *De jure belli*, which were useful to Grotius. He died at London in 1608.

(2.) *GENTILIS*, Scipio, brother to the former, and as celebrated a civilian, forsook his native country that he might openly profess the Protestant religion. He was counsellor of Nuremberg, and professor of law. In his lectures, as well as books, he mixed the flowers of polite learning with the thorns of the law. He died in 1616.

* *GENTILISM. n. f.* [*gentilisme*, Fr. from *gentile*.] Heathenism; paganism.—If invocation of saints had been produced in the apostolical times, it would have looked like the introducing of *gentilism* again. *Stillingfleet.*

* *GENTILIOUS. adj.* [*gentilitious*, Latin.] 1. Endemic; peculiar to a nation.—That an unfavorable odour is *gentilitious*, or national unto the Jews, reason or sense will not induce. *Brown.* 2. Hereditary; entailed on a family.—The common cause of this distemper is a particular and perhaps a *gentilitious* disposition of body. *Arbutnot.*

* *GENTILITY. n. f.* [*gentilité*, French; from *gentil*, French; *gentilis*, Latin.] 1. Good extraction; dignity of birth. 2. Elegance of behaviour; gracefulness of men; nicety of taste. 3. Gentry; the class of persons well born.—Gave kind must needs, in the end, make a poor *gentility*. *Drives on Ireland.* 4. Paganism; heathenism.—When people began to spy the falshood of oracles, whereupon all *gentility* was built, their hearts were utterly averted from it. *Hooker.*

GENTILLY, a town of France, in the dept.

of Paris; 4 miles S. of Paris. It was the residence of the kings of the Merovingian and Carlovingian races.

GENTILOUX, a town of France, in the dept. of Creuse, 9 miles SW. of Felletin.

(1.) * GENTLE, *adj.* [*gentilis*, Lat.] 1. Well born; well descended; ancient, though not noble.—They entering and killing all of the *gentle* and rich faction, for honesty sake broke open all prisons. *Sidney*.—These are the studies wherein our noble and *gentle* youth ought to bestow their time. *Milton*.

Of *gentle* blood, part shed in honour's cause,
Each parent sprung. *Pope*.

2. Soft; bland; mild; tame; meek; peaceable.—I am one of those *gentle* ones that will use the devil himself with courtesy. *Shak.*

Her voice was ever soft,
Gentle and low; an excellent thing in woman. *Shak.*

As *gentle*, and as jocund, as to jest,
Go I to fight. *Shak. Richard II.*
—A virtuous and a good man, reverend in conversation, and *gentle* in condition. 3 *Mac. xv. 12.*

The *gentlest* heart on earth is prov'd unkind. *Fairfax.*
Your change was wise; for, had she been deny'd,

A swift revenge had follow'd from her pride:
You from my *gentle* nature had no fears;
All my revenge is only in my tears. *Dryden.*
—He had such a *gentle* method of reproving their faults, that they were not so much afraid as ashamed to repeat them. *Atterbury*. 3. Soothing; pacific.

And though this sense first *gentle* music found,
Her proper object is the speech of men. *Davies*.

(2.) * GENTLE, *n. f.* 1. A gentleman; a man of birth. Now out of use.

Gentles, do not reprehend;
If you pardon, we will mend. *Shak.*
Where is my lovely bride?

How does my father? *Gentles*, methinks you frown. *Shak.*

2. A particular kind of worm.—He will in the three hot months bite at a flagworm, or at a green *gentle*. *Walton's Angler*.

* To GENTLE, *v. a.* To make gentle; to raise from the vulgar. Obsolete.—

He to day that sheds his blood with me,
Shall be my brother; be he never so vile,
This day shall *gentle* his condition. *Shak.*

* GENTLEFOLK, *n. f.* [*gentle* and *folk*.] Persons distinguished by their birth from the vulgar. The queen's kindred are made *gentlefolk*.

Shak. Richard III.
—*Gentlefolks* will not care for the remainder of a bottle of wine; therefore set a fresh one before them. *Savist.*

(1.) * GENTLEMAN, *n. f.* [*gentilhomme*, Fr. *gentiluomo*, Italian; that is, *gentilis*, a man of ancestry. All other derivations seem to be whimsical.] 1. A man of birth; a man of extraction, though not noble.—A civil war was within the bowels of that State, between the *gentlemen* and the peasants. *Sidney*.—

I freely told you all the wealth I had
Run in my veins; I was a gentleman. *Shak.*

He hither came a private *gentle*
But young and brave, and of a
Ancient and noble. *Or*

You say a long descent
Makes *gentlemen*, and that your
Is much disparag'd to be match'

2. A man raised above the vulgar to or post.—

Inquire me out some mean-boy
Whom I will marry straight to Clari

—He is so far from desiring to be a man, that he desires to be used as all. *Low*. 3. A term of complaisant ironical.—The same *gentlemen*, who piece of morality on the three making hand in hand, would have fou a one had there been four of them tance, and covered from head to 4. The servant that waits about the man of rank.—Sir Thomas More, ter he gave up his chancellorship wife's pew, and used the usual wo tleman usher, Madam, my lord is

Let be call'd be
That gentleman of Buckingham'

5. It is used of any man however b
The earl of Hereford was rep
In England the most valiant *gent*
—The king is a noble gentleman at *Shak.*

(2.) GENTLEMAN (§ 1. *def.* 1.) 1 prehended all above the rank of ye by even noblemen were truly ca See COMMONALTY, § 2. A *gentle* defined among heralds, to be one, w title, bears a coat of arms, or w have been freemen: and by the co tleman giveth, he is known to be, descended from those of his name many hundred years before. The ed of the French *gentil*, "fine, fast coming;" and the Saxon *man*. *T* *his homo* was used among the Rom descended of a race of noble perso name, born of free or ingenuous whose ancestors had never been sl death by law. Thus Cicero in his *ties sunt, qui inter se eodem sunt non* wards the declension of the Roman corded by Ammianus Marcellinu two companies of brave soldiers, *gentiles*, and the other *scutarii*.

thence, we derive the names *gentlem* *Pu*quire also supposes the appellation *gentes* to have been transmitted to Roman soldiery; it being to the *ge turn*, who were the bravest of the the principal hereditaries and portion assigned. See BENEFICE, § 2. 1 serving, that during the empire of the *scutarii* and *gentiles* had the best of all the soldiers, became insentit to apply the same names, *gentilhom* to such as they found their kings provision or appointments to. (

re confounded together by Sir Edward who observes, that every esquire is a gentleman and a gentleman is defined to be one in coat armour." It is indeed a matter unsettled, what constitutes the distinction; for it is not an ever large, that confers this rank upon

Camden, who was himself a herald, sets them the most accurately; and he puts forth of them. See ESQUIRE, § 1. s for gentlemen, says Sir Thomas Smith, de good cheap in this kingdom; for wholieth the laws of the realm, who studieth rarities, who professeth liberal sciences, can live idly and without manual labour will bear charge and countenance of a gentleman, he shall be called master, and shall be a gentleman.

1. GENTLEMAN USHER OF THE BLACK ROD.

2. GENTLEMEN OF THE CHAPEL; officers of duty and attendance in the royal chapel, number 32. Twelve of them are priests; 10, commonly called clerks of the chapel, performance of divine service. One is chosen for confessor of the household, to visit the sick, examine and communicate, and administer the sacrament. 20 clerks, well versed in music, is chosen first, who is master of the children, to sing in music, and whatever else is necessary service of the chapel; a second is like-ganist; a third a lutanist; and a fourth there are likewise three vergers, to carry silver rods they carry in their hands; jeant, a yeoman, and groom of the vestry attend the dean and subdean, and ceteras and other necessities for the chapel; has the whole care of the chapel, keeps records of the nobility and gentry; the his attendance within the chapel door, after it.

3. GENTLEMANLIKE. } *adj.* [gentleman and gentlemanly. } *like.* Becoming a

h. — He holdeth himself a gentleman, h to work, which, he saith, is the life of a churl; but enureth himself to his trade to the gentlemanly trade of stealing.

4. GENTLEMANLY. — Pyramus is a sweet-fac'd man; as one shall see in a summer's day; by gentlemanlike man. *Shakef.* — You set me up like a peasant, hiding from me unlike qualities. *Shakef.* — Two clergy-candidates for a free-school, where a procured the place for the better schooled gentlemanly person of the two. *Swift.*

5. GENTLENESS. *n. f.* [from *gentle*.] 1. Digress; goodness of extraction. 2. Softness; sweetness of disposition; meekness;

— My lord Sebastian, you speak, doth lack some gentleness.

3. GENTLENESS. *Shakef.* — rave and baughty scorn of all, my with that esteem'd, d slavish virtue seem'd. *Cowley.*

4. GENTLENESS.

Still she retains

Her maiden gentleness, and oft at eve Visits the herds. *Milton.*

— The perpetual gentleness and inherent goodness of the Ormond family. *Dryd. Fuh* — Charges are brought about silently and insensibly, with all imaginable benignity and gentleness. *Woodward's Nat. Hist.* — Masters must correct their servants with gentleness, prudence, and mercy. *Rovers.* — Women ought not to think gentleness of heart despicable in a man. *Clarissa.* 3. Kindness; benevolence. Obsolete. —

The gentleness of all the gods go with thee.

6. GENTLESHIP. *n. f.* [from *gentle*.] Carriage of a gentleman. Obsolete. — Some in France, which will needs be gentlemen, have more gentlenesship in their hat than in their head. *Ascham.*

7. GENTLEWOMAN. *n. f.* [from *gentle* and woman. See GENTLEMAN.] 1. A woman of birth above the vulgar; a woman well descended. — The gentlewomen of Rome did not suffer their infants to be so long swathed as poorer people. *Ap- bat's World.* —

Doth this sir Protheus

Often resort unto this gentlewoman? *Shakef.* — Gentlewomen may do themselves much good by kneeling upon a cushion, and weeping. *Bacon's Nat. Hist.* 2. A woman who waits about the person of one of high rank. —

The late queen's gentlewoman, a knight's daughter,

To be her mistress' mistress! *Shak. Hen VIII.*

Her gentlewoman, like the Nereids, So many mermaids, tended her i' th' eyes, And made their bends adorning. *Shakef.*

3. A word of civility or irony. — Now, gentlewoman, you are confessing your enormities; I know it by that hypocritical down-cast look. *Dryden.*

GENTLIN, a town of Lower Saxony, in the duchy of Magdeburg, 30 miles E. of Magdeburg.

8. GENTLY. *adv.* [from *gentle*.] 1. Softly; meekly; tenderly; inoffensively; kindly. —

My mistress gently chides the fault I made. *Dryden.*

— The mischiefs that come by inadvertency, or ignorance, are but very gently to be taken notice of. *Locke.* 2. Sottly; without violence. —

Fortune's blows,

When most struck home, being gently warded, crave

A noble cunning. *Shakef. Coriolanus.*

— A sort of great bat, as men ly asleep with their legs naked, will suck their blood at a wound so gently made as not to awake them. *Grew's Mus.*

GENTOOS, in modern history, according to the common acceptation of the term, denote the professors of the religion of the bramins or brachmans, who inhabit the country called HINDOOSTAN, or INDOSTAN, in the East Indies, from the word *san*, a region, and *hind* or *hindoo*: which Ferishteh, as we learn from colonel Dow's translation of his history, supposes to have been a son of Ham, the son of Noah. Hindoo, however, is not the name by which the inhabitants originally styled themselves; but, according to the idiom of the *Schanferit* which they use, *jumbadoep*, from

3

jumboe,

Jumboo, a jackall, an animal common in their country; and *deep*, a large portion of land surrounded by the sea; or *bheretkunt*, from *khant*, i. e. a continent, and *bherhut*, the name of one of the first Indian rajahs. They have assumed the name of *Hindoo* only since the era of the Patar government, to distinguish themselves from their conquerors the Mussalmen. The term *Gentoo* or *Gent*, in the Sanscrit dialect, denotes animal in general, and in its more confined sense, *man-kind*, and is never appropriated particularly to such as follow the doctrines of *Brahma*. The *Gentoo*s are divided into 4 great tribes, each of which has its own separate appellation; but they have no common or collective term that comprehends the whole nation, under the idea affixed by the Europeans to the word *Gentoo*. Mr Halhed, in the preface to his translation of the Code of *Gentoo* Laws, conjectures, that the Portuguese, on their first arrival in India, hearing the word frequently in the mouths of the natives, as applied to mankind in general, might adopt it for the domestic appellation of the Indians themselves; or perhaps their bigotry might figure from the word *Gentoo* a fanciful allusion to *Gentile*. The *Hindoo*s, or *Gentoo*s, vie with the Chinese as to the antiquity of their nation. They reckon the duration of the world by four *jogues*, or distinct ages: The 1st is the *Suttee jogue*, or age of purity, which is said to have lasted about 3,100,000 years: during which the life of man was 20,000 years, and his stature 21 cubits: The 2d, the *Tirtah jogue*, or the age in which one third of mankind were reprobated; which consisted of 2,400,000 years, when men lived to the age of 10,000 years: The 3d, the *Dwapar jogue*, in which half of the human race became depraved; which endured to 600,000 years, when men's lives were reduced to 1000 years: and 4th, the *Collee jogue*, in which all mankind were corrupted, or rather diminished, which the word *collee* imports. This is the present era, which they suppose will subsist for 400,000. of which near 5000 are already past; and man's life in this period is limited to 100 years. Many authors suppose that most of the *Gentoo Shasters*, or scriptures, were composed about the beginning of the *Collee jogue*: but an objection occurs against this supposition, viz. that the *shasters* take no notice of the deluge; to which the *bramins* reply, that all their scriptures were written before the time of Noah, and the deluge never extended to *Hindoo*tan. Nevertheless, it appears from the *shasters* themselves, that they claim a much higher antiquity than this; instances of which are recited by Mr Halhed. The doctrine of *TRANSMIGRATION* is one of the distinguishing tenets of the *Gentoo*s. It is then opinion, according to Mr Holwell, that those souls which have attained to a certain degree of purity, either by the innocence of their manners or the severity of their mortifications, are removed to regions of happiness proportioned to their respective merits; but that those who cannot to far surmount the prevalence of bad examples and the powerful degeneracy of the times, as to deserve such a promotion are condemned to undergo continual punishment in the animation of successive animals, until, at the stated period, another renovation of the four

jogues shall commence, upon the d the present. They imagine six disks above the earth; the highest of which is the residence of *Brahma* or *Brah* particular favourites. This sphere is a station of those men who never intermix and of those women who have united themselves with their husbands; who expressly enjoined in the code of the C This code, printed by the East India 1776, is a very curious collection of prudence, which was selected from canals in the Sanscrit language, by the erced Pundits, or lawyers; who we for this purpose from May 1773 to February 1775 is translated into the Persian into English by Mr Halhed. The contained in this collection are interwoven religion of the *Gentoo*s, and reverend highest authority. The curious recovers an astonishing similarity between the code and many of the Jewish law; between the *chambrains* or priests, and the *Levites*; the ceremony of the scape goat under dispersion, and a *Gentoo* ceremony *ashvamedh*, in which a horse and pole of the goat. Many obsolete usages, attested in many parts of the testament, may also receive illustration from the code. It appears from that the *bramins* who are the priests of the country, have resigned all executive power into the hands of the caste or tribe; and no *bramin* has been capable of the magistracy since the first *jogue*. The only privilege, in which they have appropriated to themselves exemption from all capital punishment, is perpetual exile; but it is everywhere ordained, that a *bramin* shall not die on any account whatsoever. and original tribes into which the *Gentoo*s are divided, according to their theology, 1. the four different members of *Brahma* proposed immediate agent of the creative spirit of the Almighty. These tribes are the *BRAMINS*, which proceeded from his whole office is to pray, read, and instruct; the *CHETTEREES*, which proceeded from his office is to draw the bow, to fight, and govern; 3. the *BRE*, which proceed from his belly or thigh, who are to provide food or life by agriculture and traffic; and from his feet, which are ordained to and travel. Few Christians, says the the *Gentoo* code, have expressed themselves more becoming reverence of the spiritual deities of Providence, in all with a more extensive charity towards fellow creatures of every profession *Gentoo*s. It is indeed an artifice of the *bramins*, that God's all merciful not have permitted such a number of nations, if he had not found a pleasing variety.

* GENTRY. n. s. [gentility, gentry

condition; rank derived from inheri-

are certainly a gentleman,
he experienc'd, which no less adorns
us than our parent's noble name,
in success we are gentle. *Shak.*

f people above the vulgar; those be-
vulgar and the nobility.—They slaugh-
er of the gentry, for whom no sex or
be accepted for excuse. *Sidney.*—Let
t aim at greatness, take heed how their
id gentry multiply too fast. *Bacon.*—
cheerfully the hawkers cry
and the gentry buy. *Swift,*

of civility real or ironical.—
many coloured gentry there above,
are rul'd by tumult and by love. *Prior,*
; complaisance. Obsolete.—

us so much gentry and good-will,
attend your time with us a while. *Shak.*
SING, a town of China, in the pro-
vince of Szechuen.

1. See GENOA, § 5.

ELECTENTES. See CATECHUMEN,

GENUFLECTION. *n. f.* [*genuflexion*,
and *flexio*, Lat.] The act of bending the
knee, or the motion expressed by bending the knee.
In all the rites of adoration, *genuflexions*,
as, incense, oblations, prayers only ex-
celling fleet.

GENUFLECTION, says the Jesuit Rosweyd,
in the East, has been a very ancient cus-
tom in the church, even under the Old Testa-
ment; and was observed through-
out the East, excepting on Sundays, and from
Whit Sunday, when kneeling was for-
bidden by the council of Nice. Others have
attributed the custom of not kneeling on
Sundays to the time of the apostles, as it
appears from St Irenæus, and Tertul-
lian. The Ethiopic church, scrupulously at-
tending to ancient ceremonies, still retains that
at divine service. The Russians esteem
it an indecent posture to worship God on the
knees, as the Jews usually prayed standing. Ros-
weyd gives the reasons of the prohibition of ge-
nuflection on Sundays, &c. from St Basil, Anastasi-
us, &c.

GENUINE. *adj.* [*genwinus*, Lat.] Not spu-
ritual; counterfeit; real; natural; true.—
We were at one time tried with genuine
and at another time sophisticated ones.
Faith, belief and remembrance, and love and
hope, have so great influence to make men
happy, that where any of these is, the rest, to-
gether with the true and genuine effects of them,
must follow. *Tillotson.*—

A sudden darkness covers all;
the night: night added to the groves.

Dryden.

GENUINELY. *adv.* [from *genuine*.] With-
out mixture; without foreign admixtures;
There is another agent able to analyze
bodies less violently, more genuinely,
and more universally than fire. *Boyle.*

GENUINENESS. *n. f.* [from *genuine*.] Free-
dom from counterfeit; freedom from

adulteration; purity; natural state.—It is not
essential to the *genuineness* of colours to be du-
rable. *Boyle.*

(1.) * GENUS. *n. f.* [Latin.] In science, a
class of beings, comprehending under it many spe-
cies: as *quadruped* is a *genus* comprehending un-
der it almost all terrestrial beasts.—A general idea is
called by the schools *genus*, and it is one common
nature agreeing to several other common natures:
so animal is a *genus*, because it agrees to horse,
lion, whale, and butterfly. *Watt's Logick.*—If mi-
nerals are not convertible into another species,
though of the same *genus*, much less can they
be furnished reducible into a species of another
genus. *Harvey on Consump.*

(2.) GENUS is also used for a character or man-
ner applicable to every thing of a certain nature
or condition: in which sense it serves to make
capital divisions in divers sciences, as medicine, na-
tural history, &c.

(3.) GENUS, in medicine. See MEDICINE, un-
der the *Nojology*.

(4.) GENUS, in metaphysics and logic, denotes
a number of beings which agree in certain gene-
ral properties common to them all; so that a ge-
nus is nothing else but an abstract idea, expressed
by some general name or term. See LOGIC and
METAPHYSICS.

(5.) GENUS, in music, by the ancients called
genus melodia, is a certain manner of dividing and
subdividing the principles of melody, *i. e.* the con-
sonant and dissonant intervals, into their concin-
nous parts. The moderns considering the octave
as the most perfect of intervals, and that whereon
all the cords depend, in the present theory of music,
the division of that interval is considered as con-
taining the true division of the whole scale. But
the ancients went to work somewhat differently;
the *diatessaron*, or fourth, was the least interval
which they admitted as concord; and therefore
they sought first how that might be most conve-
niently divided; from whence they constituted
the diapente and diapason. The diatessaron being
thus, as it were, the root and foundation of the
scale, what they called the *genera*, or kinds, a-
rose from its various divisions; and hence they
defined the *genus modulandi* to be the manner of
dividing the tetrachord and disposing its 4 sounds
as to succession. The genera of the music were
3, the ENHARMONIC, CHROMATIC, and DIATO-
NIC. (See these articles.) The two first were va-
riously subdivided; and even the last, though that
is commonly reckoned to be without any species,
yet different authors have proposed different di-
visions, under that name, without giving any par-
ticular names to the species, as were done in the
other two.

(6.) GENUS, in natural history, a subdivision of
any class or order of natural beings, whether of
the animal, vegetable, or mineral kingdoms, all
agreeing in certain common characters. See BO-
TANY and ZOOLOGY.

(7.) GENUS, in rhetoric, Authors distinguish
the art of rhetoric, as well as orations or discour-
ses produced thereby, into 3 genera, demonstra-
tive, deliberative, and judiciary. To the demon-
strative kind belong panegyrics, genethliacons, epi-
thalamiums, funeral harangues, &c. To the deli-

berative, perfone, dissuasions, commendations, &c. To theiciary, accusations and defences.
GENZANO, a town of Naples in the prov. of Basilicata, 12 miles ESE. of Venola.

* **GEOCENTRICK**. *adj.* [*γην and κεντρον*; *geocentrique*, Fr.] Applied to a planet or orb having the earth for its centre, or the same centre with the earth. *Harris.*

* **GEODÆSIA**. *n. f.* [*γεωδαισια*; *geodesic*, French.] That part of geometry which contains the doctrine or art of measuring surfaces, and finding the contents of all plain figures. *Harris.*

* **GEODÆTICAL**. *adj.* [*from geodæsia*.] Relating to the art of measuring surfaces; comprehending or showing the art of measuring land.

GEOFFRÆA. See **GEOFFRŒA**.

GEOFFREY OF MONMOUTH, Bp. of St Asaph, called by our ancient biographers *Gallofridus Monumetensis*. Leland conjectures that he was educated in a benedictine convent at Monmouth, where he was born; and that he became a monk of that order. Bale, and after him Pits, call him archdeacon of Monmouth; and it is generally asserted, that he was made bishop of St Asaph, in 1151 or 1152, in the reign of K. Stephen. His history was probably finished after 1138. It contains a fabulous account of British kings, from Brutus the grandson of Æneas the Trojan to Cadwallader, in 690. But Geoffrey, though we may blame his credulity, was not the inventor of the legendary history. It is a translation from a MS. written in the British language, and brought to England from Armorica by his friend Gualter, archdeacon of Oxford. But the achievements of king Arthur, Merlin's prophecies, and many speeches and letters, were chiefly his own additions. In excuse for this historian, Mr Wharton judiciously observes, that fabulous histories were then the fashion, and popular traditions a recommendation to his book.

GEOFFRŒA, or } in botany, a genus of the
GEOFFROYA, } decandria order, belonging to the diadelphia class of plants; and in the natural method ranking under the 32d order *Papilionaceæ*. The calyx is quinquefid, the fruit an oval plum; the kernel compress'd. There is only one species, viz.

GEOFFROYA INERMIS, the cabbage-bark tree, a native of Brasil and Jamaica. See *Plate CLX, fig. 5*. The wood is used in building; but it is chiefly valued for its bark, which is administered as an anthelmintic medicine. From this medical property it is also called the *worm-bark tree*. This bark is of a grey colour externally, but black and

furrowed on the inside. It has a mild and sweetish taste, and a disagreeable smell given in cases of worms, in form of decoction, syrup, and extract. The decoction is preferred; and is made by slowly boiling of the fresh dried bark in a quart of water, till it assume the colour of Madeira wine. The nels is the syrup; evaporated, it forms a solid mass. It commonly produces some sickness and sometimes violent effects, as vomiting, and fever. These last are said to be overcome by the use of warm water, castor oil, and tartaric acid. It should always be begun with small doses. But when properly and cautiously administered, it is said to operate as a ver anthelmintic, particularly for the expulsion of *lumbri*, which are a very common case in the West India islands, where it is frequently employed. But it has, we believe, but little use in Britain.

GEOFFROY, Stephen Francis, M.D. celebrated physician, botanist, and chemist, Paris, in 1672. After having finished his studies in Paris, he travelled into England, Holland, &c. In 1704, he received the degree of M.D. and at length became professor of chemistry at the Royal College. He wrote, 1. Several very curious Theſes, which were afterwards translated in French. 2. An excellent treatise intitled *Tractatus de Medicina, sive Medicamentorum simplicium virtute, delectu, et usu*. He died at Paris, in 1731.

* **GEOGRAPHER**. *n. f.* [*γην and γραφω*, French.] One who describes, according to the position of the different parts of the earth, hath employed than hath been known or described by the old geographers. *Ad Craterem* by the old geographers. *Ad Craterem* by the old geographers. *Ad Craterem* by the old geographers.

From sea to sea, from mountain to mountain, and grow a new geographer by love.

(1.) * **GEOGRAPHICAL**. *adj.* [*from γεωγραφικος*, French; from *γραφω*.] Relating to geography; belonging to geography.

(2.) **GEOGRAPHICAL MILE**, the farthest sea mile; being one minute, or the 60th part of a great circle on the earth.

* **GEOGRAPHICALLY**. *adv.* [*from γεωγραφικος*.] In a geographical manner; according to the rules of geography.—Minerva lends to the knowledge of this country; she calls it to the knowledge of this country; she calls it to the knowledge of this country.

G E O G R A P H Y.

SECT. I. DEFINITIONS and DIVISIONS of the SCIENCE.

GEOGRAPHY is thus defined by Dr JOHNSON:

* **GEOGRAPHY**. *n. f.* [*γην and γραφω*; *geographia*, French.] Geography, in a strict sense, signifies the knowledge of the circles of the earthly globe, and

the situation of the various parts of the earth. When it is taken in a little larger sense, the knowledge of the seas also; and in a still larger sense, it extends to the various customs, and governments of nations. *Warpus* is extolled by the Greeks as attaining to the knowledge of the earth; but *geography* makes slight account of, when they discourse of Andes

lg. Errs.—According to ancient fables its sailed up the Danube, and from thence into the Adriatick, carrying their heir shoulders; a mark of great ignorance. *Arbutnet on Coins.*

PHYSICAL is more accurately defined by Dr. **VARENIUS** as “the science that teaches and examines the nature and properties of the earth, as to its place, magnitude, motions, celestial aspects, &c. with the various lines, real or imaginary, on its surface. Geography is distinguished from **TOPOGRAPHY**, as a part from the whole; considering the whole visible world, land and earth. And from **TOPOGRAPHY** it is distinguished, as the whole from a part.

PHYSICAL considers geography as either exterior: but **VARENIUS** more justly divides it into general and special, or universal and particular.

GENERAL OR UNIVERSAL GEOGRAPHY is that which considers the earth in general without reference to particular countries; or the affection of the whole globe, as its figure, motion, land, sea, &c.

SPECIAL OR PARTICULAR GEOGRAPHY is that which contemplates the constitution of the several regions, or countries, their bounds, climate, seasons, weather, inhabitants, arts, language, &c..”

PHYSICAL is considered in a still more extensive and comprehensive view, by other modern geographers, who divide it into **ASTRONOMICAL** and **PHYSICAL** GEOGRAPHY.

ASTRONOMICAL GEOGRAPHY comprehends the determination of the magnitude and figure of the earth, the measurement of the degree of the arc of different latitudes: Proportion of the circumference to the diameter of the equator: Circumference of the earth: Division of its surface by latitude; by zones; by circles of longitude: Methods of finding the latitude and longitude: Representation of the earth's surface on a spherical globe; and on a plane: by maps; by charts; stereographic, conical, and globular projection, &c. &c.

PHYSICAL GEOGRAPHY comprehends the description of the earth, according to the properties of its several substances, which compose it: The division into solid and fluid: division of the atmosphere into air and water: The gravity, extent, depth, saltness, productions, and general properties of the ocean; the phenomena of the winds, whirlpools, &c. Division of the earth into stratified and unstratified; metallic veins, &c. Natural divisions of the earth from the variousities of its surface: Structure and height of mountains, &c. Divisions of the earth as connected with the atmosphere: View of its constitution: elasticity, density, and temperature: Congelation; evaporation; rain; origin of rivers, springs, and lakes; motion, velocity, and windings, inundations, &c. of rivers: Divisions of the earth from the distribution of cold of its surface: Unequal distribution of heat in the atmosphere the cause of winds: The various forms of the earth formed by the phenomena of the sea, &c. &c.

It must be allowed, that this complete and comprehensive view of the science, is quite agreeable to the original meaning of the word, *Γεωγραφία*, which is derived from *γῆ*, earth, and *γραφειν*, to write or describe; and may therefore be used to signify a description of the earth, both external and internal, in the fullest sense of the word. But as **PHYSICAL GEOGRAPHY** comprehends the subject of many other sciences, which will be found treated of under **AEROLOGY**, **CHEMISTRY**, **EARTH**, **ELECTRICITY**, **MAGNETISM**, **METALLURGY**, **MINERALOGY**, **RIVER**, **TIDE**, **WIND**, &c. &c. we mean to restrict the present treatise to **ASTRONOMICAL GEOGRAPHY**, and more especially to that branch of it above defined by **VARENIUS**, under the title of **GENERAL GEOGRAPHY**; the particular geography of the various countries, kingdoms, cities, towns, &c. being to be found in their order, under their respective names throughout this work.

SECT. II. HISTORY of GEOGRAPHY.

It is quite uncertain when geography began first to be studied among mankind. It is generally agreed, that the knowledge of it was derived to the Greeks, who first of the European nations cultivated this science, from the Egyptians or Babylonians; but it is impossible to determine which of these two nations had the honour of the invention. Herodotus tells us, that the Greeks first learned the poles, the gnomon, and the 12 divisions of the day, from the Babylonians. **PLINY**, and **DIOGENES LAERTIUS**, however, tell us, that **Thales of Miletus** first found out the passage of the sun from tropic to tropic; which he could not have done without the assistance of a gnomon. He is said to have been the author of two books, the one on the tropic, and the other on the equinox; both of which he probably determined by the gnomon; and thus he was led to discover the four seasons of the year, which are determined by the solstices and equinoxes.

THALES divided the year into 365 days; which was undoubtedly a method discovered by the Egyptians, and communicated by them to him. It is said to have been invented by **Mercurius Trismegistus**, who, according to **Eusebius**, lived about 50 years after the departure of the Israelites out of Egypt. **Pliny** tells us expressly, that this discovery was made by observing when the shadow returned to its marks; a clear proof that it was done by the gnomon. **Thales** also knew the method of determining the height of bodies by the length of their shadows, as appears by his proposing this method for measuring the height of the Egyptian pyramids. Hence many learned men have been of opinion, that as the use of the gnomon was known in Egypt long before the dawn of learning in Greece, the pyramids and obelisks, which to common travellers appeared to be only buildings of magnificence, were in reality as many sun-dials, built on a very large scale, with a design to ascertain the season of the year, by the variation of the length of their shadows. In confirmation of this opinion, it was found by **M. CHAZELLES**, in 1694, that the two sides, both of the larger and smaller pyramids,

stood

G E O G R A P H Y.

stood exactly N. and S.; so that they still form true meridian lines.

From the time of Thales, who flourished in the sixth century before Christ, very little seems to have been done towards the improvement of geography for 200 years. During this period, there is only one astronomical observation recorded; namely, that of METON and EUPTOMON, who observed the summer solstice at Athens, during the archonship of Apseudes, on the 21st of the Egyptian month Phamenoth, in the morning, being the 27th of June, A. A. C. 432. This observation was made by watching narrowly the shadow of the gnomon, and was done with a design to fix the beginning of their cycle of 19 years.

TIMOCHARIS and ARISTILLUS, who began to observe about A. A. C. 395, seem to have been the first who attempted to determine the longitudes and latitudes of the fixed stars, by considering their distances from the equator. One of their observations gave rise to the discovery of the precession of the equinoxes, which was first observed by HIPPARCHUS, about 150 years after; who also made use of their method, to delineate the parallels of latitude, and the meridians on the surface of the earth; thus laying the foundation of the science, as it is now studied.

The latitudes and longitudes, thus introduced by Hipparchus, were not however, much attended to till PROCELY'S time. STRABO, Vitruvius and Pliny, entered into a minute geographical description of the situation of places, according to the length of the shadows of the gnomon, without taking the least notice of the longitudes and latitudes.

But Hipparchus's discovery of the longitudes and latitudes soon laid a foundation for making maps, or delineations of the surface of the earth *in plano*, on a very different plan from what had been formerly attempted. Maps were at first little more than rude outlines and topographical sketches of different countries. The earliest were those of SESOSTRIS, mentioned by Eustathius; who says, that "this Egyptian king, having traversed great part of the earth, recorded his march in maps, and gave copies of his maps not only to the Egyptians, but to the Scythians, to their great astonishment."

Some imagine, that the Israelites made a map of the Holy Land, when they gave the different portions to the seven tribes at Shiloh, which seems extremely probable. for JOSHUA tells us, that they were sent to walk through the land, and that they *described it by cities in seven parts in a book*; and JOSEPHUS tells us, that when Joshua sent out people from the different tribes to measure the land, he gave them, as companions, persons well skilled in geometry, who could not be mistaken (Josh. xviii. 8, 9.)

The first Grecian map on record is that of ANAXIMANDER, mentioned by STRABO, lib. i. p. 7. It has been conjectured, that this was a general map of the then known world, and it is supposed to be the one referred to by Hipparchus as *name of the ancient map*.

ERATOSTHENES minutely describes a map made by ANAXAGORAS tyrant of Miletus, which will give us some idea of the maps of those

ages. He tells us, that ANAXAGORAS sent Cleomenes king of Sparta, with a vessel, to attack the king of Persia, palace at Susa, in order to restore them their ancient liberty. It was traced in copper, and contained the intermediate which were to be traversed in that manner, as Eratosthenes tells us, that it contained "the circumference of the earth, the whole of it, and all the rivers;" but from the statuary at that time, it may be fairly conjectured by the *whole sea* was meant no more than the Mediterranean; and therefore, the earth was divided into the coasts of that sea, and par Lesser Asia, extending towards the Persia. The rivers were the Halys, and Tigris, which Herodotus mentions to be crossed in that expedition, contained one straight line, called the *way*, which took in all the places of it from Sardis to Susa. Of these there the whole journey, containing 13,500 Roman miles of 5000 feet each.

These itinerary maps of the places were indispensably necessary in ANAXAGORAS quotes ERATOSTHENES as author of the *encampments of Alexander* and likewise Amyntas to the same purpose tells us, that Diogenes and Eratosthenes surveyors of Alexander's marches, and the exact number of miles according to duration; which he afterwards confirmed by letters of ALEXANDER himself. The latter also remarks that a copy of this great survey was given by Xenocles his son PATROCLES the geographer, who, as Eratosthenes informs us, was admiral of the fleets of Antiochus. His book on geography is quoted both by Strabo and Pliny; and Eratosthenes with the principal in constructing this map of the oriental world.

ERATOSTHENES first attempted to apply to a regular system, and introduced a regular parallel of latitude. This was certain places where the longest day was the same length. He began it from the straits of Gibraltar; and it thence passed through the sea, and near the southern extremity of Sicily. Thence it was continued to the straits of Rhodes and the Bay of Issus; entering Cilicia, and crossing the Euphrates, it was extended to the mountain Caucasus. By means of this line, he endeavoured to correct the errors of the ancient map. In doing this, he was regulated by observing the longest day was 14½ hours, which he afterwards determined to be the latitude of Rhodes. This first parallel through Rhodes was considered with a degree of preference as the foundation stone of all ancient maps; a general idea of the then known world was attempted to be measured in stadia and according to the extent of that line, by the geographers.

Eratosthenes soon after attempted to draw other parallels of latitude, but also a meridian at right angles to these, passing

of Alexandria, down to Syene and Menelaus at last undertook a still more arduous task to determine the circumference of the earth by an actual measurement of a segment of great circles.

But the magnitude of the earth is insupportable which has probably engaged the efforts of astronomers and geographers ever since the figure of it was known. ANAXAGORAS is said to have been the first among the ancients who wrote upon this subject. ARCHYTA, a Pythagorean, famous for his mathematics and mechanics, also made attempts in this way; and Dr Long conjectures these are the authors of the most ancient treatise, that the circumference of the earth is 360,000 stadia. ARISTARCHUS of Samos is also said to have considered the magnitude of the sun and moon. ARCHYTA is also said to have held the circumference of the earth to be 30,000 stadia; but it does not appear what methods were made use of by these philosophers to solve the problem. Perhaps they were assisted by observations of stars in the sky, the horizon, and actual mensuration of parts of the circumference of the earth. PTOLEMY in his treatise *De Geog.* affords a clue. In that work he says, that distances through our zenith, according as we go more or less northerly; and that the parts of the earth stars come above us, which, if we go northward, are no longer visible. Hence it appears, that there are different methods of measuring the circumference of the earth, by observing stars which pass through the zenith of one place, and do not pass through the zenith of another; the other by observing some stars above the horizon of one place, and are not visible at the same time to be in the horizon of another. ERATOSTHENES, made use of the former method, is the best, at Alexandria in Egypt, A. D. 276.

He knew, that at the summer solstice the sun was vertical to the inhabitants of Syene, and that the sun's shadow, under the tropic, where they had a well built for the purpose, on the bottom of which the rays of the sun fell perpendicularly on the day of the summer solstice. He observed by the shadow of a column perpendicular in an hemispherical basin, how much the sun was on that day at noon in the zenith of Alexandria; and found it to be the 50th part of a great circle. Then supposing Syene and Alexandria to be under the same meridian, he concluded the distance between them to be the 50th part of a great circle upon the earth; and this being by measure 5000 stadia, he concluded the circumference of the earth to be 250,000 stadia: as this number divided by 360 would give a degree, either Eratosthenes or some of his followers assigned the round number of 360,000 stadia to a degree; which multiplied makes the circumference of the earth 360,000 stadia; whence both these measures are different authors as that of Eratosthenes, and of POMPEY the Great, POSSIDONIUS attempted to measure the circumference

of the earth by Aristotle's 2d method, viz. horizontal observations. Knowing that the star called Canopus was but just visible in the horizon of Rhodes, and that at Alexandria its meridian height was the 48th part of a great circle in the heavens, or $7\frac{1}{2}$ deg.; answering to the like quantity of a circle on the earth: then supposing them both to be under the same meridian, and the distance between them to be 5000 stadia, the circumference of the earth will be 240,000 stadia; which is the first measure of Possidonus. But according to Strabo, Possidonus made the measure of the earth to be 180,000 stadia, at the rate of 300 stadia to a degree. The reason of this difference is thought to be, that Eratosthenes measured the distance between Rhodes and Alexandria, and found it only 3,750 stadia: Taking this for a 48th part of the earth's circumference, which is the measure of Possidonus, the whole circumference will be 180,000 stadia. This measure was received by MARINUS of Tyre, and is usually ascribed to Ptolemy. Possidonus's method, however, is found to be exceedingly erroneous, on account of the great refraction in the stars near the horizon, the difficulty of measuring the distance at sea between Rhodes and Alexandria, and from his supposing these places under the same meridian, when they are really very different. CALPURNIUS remarks, that taking exactly the mean betwixt the last dimensions of Eratosthenes and Possidonus, a degree of a great circle upon the earth will be 600 stadia, and a minute of a degree 10 stadia, which is just a mile and a quarter of the ancient Roman measure and a mile of the modern measure.

Several geographers, after the time of Eratosthenes and Possidonus, made use of the different heights of the pole in distant places under the same meridian, to find the dimensions of the earth. About A. D. 800, the khalif Almamun had the distance measured of two places two degrees asunder, and under the same meridian, in the plains of Sinjar near the Red Sea. The result was, that the mathematicians found the degree at one time to consist of 36 miles, and at another of $36\frac{1}{2}$, or $36\frac{3}{4}$.

The next attempt to find the circumference of the earth was in 1525, by FERMEL, a learned French physician. To attain his purpose, he took the height of the pole at Paris, going from thence directly northwards, until he came to the place where the height of the pole was one degree more than at that city. The length of the way was measured by the number of revolutions made by one of the wheels of his carriage; and after proper allowances for the declivities and turnings of the road, he concluded that 68 Italian miles were equal to a degree on the earth.

SNELLIUS, an eminent Dutch mathematician, next attempted to measure the circumference of the earth. Having taken the heights of the pole at Alcmarr and at Bergen op Zoom, he found the difference to be $1^{\circ} 11' 30''$. He next measured the distance betwixt the parallels of these two places, by taking several stations and forming triangles; by means of which he found the degree to consist of 341,676 Leyden feet. Having measured the distance betwixt the parallels of Ale-

G E O G R A P H Y.

and Leyden, which differ only half a degree in their latitude, the calculation came out 342,120 Leyden feet to a degree. Hence he assigned the round number 342,000 Leyden feet to a degree: which, according to Picard, amounts to 55,021 French toises.

In 1635, Mr NORWOOD, an Englishman, took the elevations of the pole at London and at York; and having measured the distance betwixt the two parallels, assigned 69½ miles and two poles to a degree; each pole being reckoned 16½ feet.

After 1654, Ricciolus made use of several methods to determine the circumference of the earth; from all which he concluded, that one degree contained 64,363 Bologna paces, which are equivalent to 61,650 French toises. The most remarkable attempt, however, was that of the French mathematicians, who employed telescopic sights for the purpose, which had never been done before. These are much the best; as by them the view may be directed to an object at a greater distance, and towards any point with more certainty; whence the triangles for measuring distances may be formed with greater accuracy than otherwise can be done. In consequence of this improvement, the fundamental base of their operations was much longer than that made use of by Snellius or Ricciolus. The distance measured was between the parallels of Sourdon and Malvoisine; between which the difference of the polar altitude is somewhat more than one degree. The result of the whole, as related by PICARD, was, that one degree contained 57,060 French toises.

As this problem can be the more accurately determined in proportion to the length of the meridian line measured, the members of the Royal Academy prolonged theirs quite across the kingdom of France, measuring it trigonometrically all the way. This work was begun in 1683, and finished in 1718. They used Picard's fundamental base, as being measured with sufficient accuracy; and an account of the whole was published by Cassini in 1720. In this work some mistakes were detected in the calculations of Snellius; and it was likewise shown, that there are errors in those of Ricciolus owing principally to the latter having taken too short a fundamental base, and not having paid sufficient attention to the effects of refraction. But though Snellius, had made some mistakes in his calculations, there is no reason to doubt the accuracy of his observations. Holland, by its flatness, is the fittest country in Europe for measuring an arc of the meridian; and Snellius had an uncommon opportunity of observing the exactness of his fundamental base, viz. the distance betwixt one tower at Leyden and another at Southerwode. A frost happened just after the country round Leyden had been overflowed; by which means he was enabled to take two stations upon the ice, the distance between which he carefully measured 4 times over; and then from these stations he observed the angles which the visual rays pointing at those towers made with the straight line upon the ice. From these considerations professor MUSCHENBROEK was induced to make new calculations and form triangles upon the fundamental base of Snellius, which he did in 1700; and from thence he assigns

57,033 toises to a degree, which is more than had been done by the academicians.

In consequence of various opinions entertained concerning the true figure of the earth, and the magnitude of a degree upon Messrs. MAUPERTUIS, CLAIRAUT, and L'OUTRE, of France, were sent by Louis the 14th to measure the arch of the meridian in different regions of the earth.

They began their operations, assisted by CELSIUS, an eminent astronomer of Sweden, in Lapland, in July 1736; and by the end of May following, had obtained the measure of that degree which their point was in lat. 66° 20' N. and found it to be 57,439 toises when reduced to the level. About the same time another company of philosophers were sent to South America, consisting of GODIN, BOUGUER, and CONDAMINE, to whom were joined Don JOSE and Don ANTONIO DE ULLOA, of Spain. They began their operations in Europe in 1735, and began their operations in the province of Quito in Peru, in October, and finished them after many interruptions 8 years. The Spanish gentlemen published a separate account, and assigned for a degree of the meridian, at the equator, 56,753 toises. M. Bouguer makes it 56,753 reduced to the level of the sea; and Cassini states it at 56,749 toises.

M. LA CAILLÉ, being at the Cape of Hope in 1751, found the length of the meridian in lat. 33° 18' 30" S. to be 57,074 toises. In 1755, Father BOSCHICI found the length of a degree in lat. 43° to be 57,050 toises.

In 1740, Messrs Cassini again examined the measures in France; and, after the necessary corrections, found the length of a degree whose middle point is in lat. 46° to be 57,074 toises; and in the lat. of 57° to be 57,050 toises. In 1764, F. BECCA measured a portion of the meridian in the neighbourhood of Vienna, and found the length of a degree whose middle point was 44° 44' N. to be 57,024 toises. Vienna is 3 degrees of the meridian west from which it may be concluded that lat. 47° 40' N. may be reckoned to be 57,024 Paris toises. In 1766, Messrs MASON measured a part of the meridian in Maryland, and found that the length of a degree whose middle point is 39° to be 57,024 English feet, or 56,904½ toises.

To the history of these attempts to measure degrees of the meridian, we may add considerable additional information upon which may be expected, when the Survey of the Coast shall be completed, which was begun by Gen. ROY some years ago, and continued in a style of accuracy greatly superior to any former system of geometrical operations. An important addition has also been made to our knowledge of the figure of the earth, by the very extensive arch of the meridian reaching from Dunkirk to Barcelona, measured by order of the constituent Assembly of France, for the purpose of establishing an universal standard of weights and

elucidation of this problem of the circumference of the earth was essentially necessary for the radical principles of all maps; ANAXIMENES, though the best of which can boast, was nevertheless exceedingly and inaccurate. It contained little the states of Greece, and the dominions of Alexander, digested according to the surveys above mentioned. He ordered, and has quoted, the voyages of into the great Atlantic ocean, which some faint idea of the western parts of not so imperfect, that they could not into the outlines of a chart. Strabo, as extremely ignorant of Gaul, Spain, Britain, Italy, the coasts of the Adriatic, and all the countries towards the made the distance between Epidamnus and the Adriatic, and the bay of the Egean sea, to be only 900 stadia, altho it was above 2000; and enlarged from Carthage to Alexandria to 15,000 in reality it was only 9000.

the state of geography and the nature prior to the time of HIPPARCHUS; a closer connection between geography and astronomy, by determining the longitudes from celestial observations, first steps to this new projection of the been in a great measure made easy by as, upwards of 50 years before the Hipparchus, when he inverted his noble or measuring the surface of a sphere rent segments.

been often the occasion of making or the maps of different countries; and geography made great advances from the Roman arms. In all the provided by that people, camps were every-rected at proper intervals; and roads with substantial materials, for making communication between them: and thus and surveying were carried on according throughout the extent of that large very new war produced a new survey of the countries where the scenes acted; so that the materials of geography accumulated by every additional contribus tells us, that at the beginning of Punic war, when HANNIBAL was pre-paring for his expedition against Rome, the countries which he was to pass were carefully measured by the Romans.

ÆSAR caused a general survey of the empire to be made, by a decree of the senate; the surveyors, ZENODOXUS, THEOPHILUS, POLYCLITUS, had this task assigned to them; and he said to have completed it in 25 Roman itineraries, that are still extant, but care and pains they had been at, surveys in all the different provinces of the empire; and Pliny has filled the 3d, 4th, and 5th of his Natural History with the geotances that were thus measured. All the maps are still preserved, known by the name of the *Ptolemaic Tables*, published by Bertius, which give a sufficient specimen of the state of geography in the Roman times. Vegetius calls the *Itinera Pida*, for

the clearer direction of their armies in their march.

The Roman empire had been enlarged to its greatest extent, and all its provinces well known and surveyed, when PTOLEMY, in the reign of Antoninus Pius, about A. D. 150, composed his system of geography. The principal materials he made use of for composing this work, were the proportions of the gnomon in its shadow, taken by different astronomers at the times of the equinoxes and solstices; calculations founded upon the length of the longest days: the measures or computed distances of the principal roads contained in their surveys and itineraries; and the various reports of travellers and navigators, who often determined the distances of places by hearsay and conjecture. All these were compared together, and digested into one uniform body or system; and afterwards were translated by him into a new mathematical language, expressing the different degrees of longitude and latitude, according to the invention of Hipparchus; but which Ptolemy had the merit of carrying into full practice and execution, after it had been neglected for upwards of 200 years. With such imperfect and inaccurate materials, it is no wonder to find many errors in Ptolemy's system. Neither were the errors such as had been introduced in the more distant extraneous parts of his maps, but even in the very centre of that part of the world which was best known to the ancient Greeks and Romans, and where all the famed ancient astronomers had made their observations. Yet this system, with all its imperfections, continued in vogue till the end of the 15th century.

The improvements in geography, which, since that period, have taken place, were owing to the great progress made in astronomy by Copernicus, Galileo, Newton, and other eminent men who lived within these 3 last centuries. More correct methods and instruments for observing the latitude were found out; and the discovery of Jupiter's satellites afforded a much easier method of finding the longitudes than was formerly known. The voyages also made by celebrated navigators of different nations, which were now become much more frequent than formerly, brought to the knowledge of the Europeans a vast number of countries totally unknown to them before. The late voyages of Captain Cook, made by order of his Britannic Majesty, have contributed more to the improvement of geography, than any thing that has been done during the 18th century. See COOK, N° III. § 2—11.

To these may be added the voyage made by VANCOUVER to explore the NW. coasts of America; and that of the unfortunate LA PEYROUSE in the South Sea: as well as the late important additions made to geographical knowledge by the discoveries made by Mr MUNRO PARK, in his Travels in the interior Parts of Africa. On the whole the geography of the utmost extremities of the globe is now in a fair way of being much better known to the moderns, than that of the most adjacent countries was to the ancients: at least with regard to the sea-coasts of these countries; for, as to their internal geography, it is less known now than before, except in a very few places. Still however, it must be owned, that geography is a science

even yet far from perfection. The maps of America and the eastern parts of Asia are, perhaps, more unfinisbed than any of the rest. Even the maps of Great Britain and Ireland are imperfect and unsatisfactory; and the great numbers of them, that are varied and republished, without any real improvement, confirm an observation made by Lord Bacon, that an opinion of plenty is one of the causes of want. The late Mr Bradley was of opinion, that there were but two places in England whose longitude might be depended upon as accurately taken; and that these were the observatory at Greenwich, and Serburn castle, the seat of the earl of Macclesfield in Oxfordshire; and that their distance was one degree in space, or four minutes in time. Even this was found to be inaccurate, the distance in time being observed by the late transit of Venus to be only 3 minutes and 47 seconds. It were well, however, if there were no greater errors with regard to other places; but if we examine the longitude of the Lizard, we shall find scarce any two geographers that agree concerning it; some making it $4^{\circ} 40'$ from London; others 5° , and others $5^{\circ} 14'$; while some enlarge it to 6° . Our best maps are therefore still to be considered as unfinished works, where there will always be many things to be added and corrected, as future geographers may find time and opportunity.

The chief works on geography among the moderns are Johannes de Sacrobosco, (or John Hallifax,) *De sphaera*; Sebastian Munster's *Cosmographia Universalis*; Clavius, on the sphere of Sacrobosco; Piccioli's *Geographia et Hydrographia Reformata*; Weigelius's *Speculum Terre*; De Chales's Geography, in his *Mundus Mathematicus*; Cellarius's Geography; Cuviers *Introduction in l'Universum Geographiam*; Leibnecht's *Elementa Geographiae Generalis*; Stevemus's *Compendium Geographicum*; Wolfii *Geographia*, in his *Elementa Mathematicae*; Busching's *New System of Geography*; Gordon's, Salmon's, and Guthrie's Grammars; and, above all, Varenus's *Geographia Generalis*, with Jurin's additions, the most scientific and systematical of any geographical work.

SECT. III. Of the FIGURE and MAGNITUDE of the EARTH.

THE EARTH is one of the great bodies which compose the planetary system. It moves round the sun in an orbit nearly circular, and compleats its revolution in the course of a year, while at the same time it revolves continually upon its own axis, which is inclined to the plane of its orbit at an angle of $66\frac{1}{2}$ degrees; the time of a revolution being 23 hours and 56 minutes. The revolution of the earth round the sun is called its ANNUAL MOTION, and the rotation it performs on its own axis is called its DIURNAL MOTION.

While the earth revolves round the sun in the course of its annual motion, its axis, round which the diurnal motion is constantly performed, moves always parallel to itself. It is by the parallelism the axis, and the annual motion of the earth, that the changes of the seasons are produced, as been already explained at large; (See *ASTRONOMY, Part 3, Sect. 3.*) while by the diurnal motion all places on the earth's surface are alternate-

ly turned towards the sun, and by the changes of day and night are produced. *ASTRONOMY, § 412 and 413.*

That the earth is nearly of a sphere may be proved by many arguments: these have been given under *ASTRONOMY* and 389. See also *HEATH, § IV, ii* this conclusion has been drawn from which were not greatly complicated, and which were intimately connected with the common affairs of life, it is reasonable to conclude that the attention which was determined the returns of the proper performing the labours of husbandry regulation of civil affairs, would lead early period of society to form pretty of the figure of the earth. When it once known to be spherical, the curiosity would naturally lead him to endeavour its dimensions; and we accordingly history, that such attempts were not been already noticed in last section. accurate measure that was made of which we have any certain knowledge executed by M. PICCARD, in France end of the last century, and which finished several times since that period. difficult to understand in what way it be measured; the direction of gravity perpendicular to the earth's surface shows that the zenith of any place, or heavens directly over our head, and zon which is a plane touching the earth at that place, will be continually changing as we change our position on the surface. Hence it follows, that as we go to N., the pole of the heavens, or the heavens, in which the earth's axis is produced meets the sphere of the fixed stars more and more elevated above the meridian altitude also of the stars in regions of the heavens will appear while that of the stars in the southern hemisphere be diminished. By the elevation of the stars, we shall know the angle point of concurrence of perpendiculars earth's surface at each extremity of arc; for this angle is equal to the diurnal meridian altitude of the same star at extremities of the arc, diminished which the arc itself subtends as seen which last angle is altogether independent number of degrees in the arc being only necessary to determine its length known measure, as a fathom, &c. but be a work of great labour to apply an arc of great extent, it will be if extremities be connected by a series to those of a base line of 3, or 4000 l and considering the accuracy with angles of these triangles can be observed of the arc may be found with great was in this way that degrees of the earth been repeatedly measured. In France, within these few years, an measured extending from Dunkirk and the degree whose middle is situated has by this means been found to be

the spherical figure be the most simple, it is natural for man to suppose objects as they are, which he most readily comprehends. The simplicity of nature is not always that of our conceptions. Infinitely varied. Nature is only simple in her cause: economy consists in producing a great variety of circumstances, by means of a few general laws. The earth is a result of these laws, which, a great variety of circumstances, may easily sensibly from a spherical figure; small variations, observed in the length of the meridian in France, sufficiently at such a deviation did exist; but they were unavoidable in such observations: an important phenomenon in a state of

SCIENCE, in which this has been warmly agitated, concluded with the difference of magnitude in the meridian, if real, would be most sensibly by the comparison of degrees measured at the equator and towards the poles. A company of Academicians was sent to Lapland, where, having measured a degree, they found it to contain 56,753 toises shorter, by 174 toises than a degree at 45° N. Other Academicians were sent to Lapland, and having measured a degree, they found it to be 57,458 toises, which was 1,705 toises shorter than the degree at the equator by 68 toises. These measurements, it was concluded, that the earth was not exactly spherical: measurements of degrees made since have all tended to shew, that the meridian gradually increases from the poles.

The earth is the next curve in point of simplicity, and the earth has been considered as formed by the revolution of a circle about its lesser axis; its oblateness or flattening, in the direction of its poles, is a consequence of the observed increase of the length of the meridian from the equator to the poles. The radii of the degrees being in the direction of the gravity, they are by the law of the centrifugal force perpendicular to the surface, with which the earth is in a great degree. They do not therefore, as in a circle, tend to the centre of the spheroid; they are in the same direction, nor of the same length, as the radii drawn from the centre to the surface; which cut it obliquely every part at the equator and poles. The two adjoining perpendiculars, for the same meridian, meet each other, at the end of the small terrestrial arc which they form between them. If this arc were a straight line, these perpendiculars would be parallel; but in proportion as this arc is curved, they would meet at a distance; but in proportion as this arc is curved, they would meet at a distance the less, as the curvature of the arc is greater. Hence it follows, that seeing the earth is the point where the length of the ellipse is the least, the radius of a

degree at the pole, and consequently that degree itself, must be the greatest of any degree on the earth's surface. On the contrary, at the equator, or at the extremity of the greater axis, the curvature is the least, and therefore the degree in the direction of the meridian is there the smallest. And in going from the equator to the pole, the degrees increase in such a manner, that if the ellipse be not very eccentric, the increase is nearly proportional to the square of the sine of the latitude.

If the earth were exactly an oblate spheroid, its magnitude, as well as the proportion of its axes, might be determined by the measurement of two degrees in the direction of the meridian, as has been already explained. See EARTH, § IV, ii. It should also follow, that by a comparison of all the degrees hitherto measured, taken two and two, we should obtain the same proportion between the axes. This, however, has not been the case. The results have indeed shewn, that the earth is flattened at the poles; but they have left an uncertainty as to the quantity of the compression, extending from between the 170th to the 330th part of the radius of the equator. Between these two quantities, the former of which is nearly double of the latter, most of the results are placed; but in such a manner, that those most entitled to credit are much nearer to the least extreme than to the greatest.

In consequence of this disagreement in the result of comparisons of degrees of the meridian, measured in different latitudes, it has been concluded by mathematicians, that the figure of the earth is not that of a spheroid; nor does it even appear, that the parts of it on each side of the equator are exactly similar.

It will, however, be sufficient for the purpose of Geography, to suppose the earth a spheroid. Upon this hypothesis, LA PLACE, by a comparison of the arc of the meridian measured at the equator, and another measured between Dunkirk and Mountjoy, has found, that the polar diameter is less than the equatorial by one 334th part of the latter; and that a 4th part of the elliptic meridian is 5,230,740 toises; the toise being that used in measuring the earth in Peru, and reduced to a temperature of 56½ degrees of a mercurial thermometer, divided into 100 degrees from the freezing point to that of water, boiling under a pressure equivalent to a column of mercury 76 centimetres in height, or about 30 inches English measure. This determination also agrees nearly with the results from the combination of a great number of experiments made at different places of the earth, upon the pendulum.

Because the measure of a degree at the equator has been assumed, in the preceding calculation at 56,753 toises, it follows also from the method explained under the article EARTH, § IV, ii. that the equatorial diameter is 3,172,267, and the polar diameter 3,161,471 toises; the difference between them being 10,796 toises. From these data and the rules of mensuration, it will be easy to find the surface, solidity, &c. of the earth, also the number of miles in a degree, &c.

The French government have taken the length of the quadrant of the meridian, as the basis of a new system of weights and measures. The ten millionth part of the quadrant has been assumed as

the *metre* or unit of linear measures, from which all the other measures are formed, by taking its multiples and submultiples according to the decimal mode of notation. Thus it appears the *metre* is expressed by the decimal fraction of the *toise* 511,074. For a full account of the measures of the French Republic, see *MEASURE*.

The following table of the dimensions of the earth is given by Dr HUTTON.

The diameter	79,579 $\frac{1}{2}$ miles
The circumference	25,000 miles
A degree contains	69 $\frac{1}{2}$ English miles
The superficies	198,944,206 square miles
The solidity	263,930,000,000 cubic miles.

SECT. IV. Of the CIRCLES supposed to be DESCRIBED ON the EARTH'S SURFACE.

IN geography the circles, which the sun apparently describes in the heavens, are supposed to be extended as far as the earth, and marked on its surface. In like manner we may imagine as many circles as we please to be described on the earth, and their planes to be extended to the celestial sphere, till they mark concentric ones on the heavens. The most remarkable of those supposed by geographers to be described in this manner are the following:

The *AXIS* of the earth is that imaginary line passing through the earth's centre, round which it continually revolves, from west to east.

The *POLES* of the earth are the points at which the axis meets the earth's surface. One of these is called the north pole, and the other the south pole. These correspond to the poles of the heavens, or the points where the earth's axis, when produced, meets the starry sphere.

The *EQUATOR* is a great circle on the earth's surface, equally distant from both poles, and corresponds to the equinoctial circle in the heavens. It divides the earth's surface into two equal portions called the *northern* and *southern hemispheres*. The equator is also sometimes called the *LINE*, or *EQUINOCTIAL LINE*.

The distance of any place, northward or southward from the equator, is called its *LATITUDE*, and is reckoned in degrees and minutes, &c. The distance between the poles and equator, which is a quadrant of a great circle passing thro' the poles, has by all geographers hitherto been supposed to be divided into 90 degrees; and each of these again subdivided into 60 minutes, &c. But some French astronomers, and in particular LA PLACE, in his *Exposition du Systeme du Monde*, as well as in his *Traite de Mecanique Celeste*, has adopted the decimal division of the meridian. They have supposed the distance between the equator and the poles to be divided into 100 degrees, and each degree to be subdivided into 100 minutes, each minute into 100 seconds, and so on.

All places lying on the north side of the equator are said to have north latitude; on the contrary, all places on the south side of the equator are said to have south latitude.

PARALLELS OF LATITUDE are lesser circles upon the earth's surface parallel to the equator; they are considered as indefinite in number; that lie directly east or west from each other are said to lie in the same parallel of latitude.

The *TROPICS* are two lesser circles or parallels to the equator, and 23 $\frac{1}{2}$ degrees from it. That which lies on the north of the equator is called the *TROPIC OF CANCER*; that which lies on the south side is the *TROPIC OF CAPRICORN*. These correspond to the circles of the same name, and the sun's north and south declination in the equinoctial in the heavens.

The *POLAR CIRCLES* are two lesser circles on the earth's surface, parallel to the equator, as far distant from the poles, which are as far distant from the poles, which are round, as the tropics are from the equator. That which lies towards the north pole is the *ARCTIC CIRCLE*, and that which lies towards the south pole is called the *ANTARCTIC CIRCLE*. To these there are corresponding circles in the heavens.

Great circles passing through the poles of the earth, and therefore perpendicular to the equator, are called *MERIDIANS*. The meridian through any particular place, lies in the celestial meridian of that place. It divides the surface of the earth into two portions, called the *eastern* and *western hemispheres*, in respect of that place. The meridian is considered as indefinite in number; any two lying directly north and south from each other are upon the same meridian. Sometimes the meridian of a place is understood the great circle, passing through that place, and tending from the one pole to the other. The other half of the circle is called the *antimeridian*.

If we suppose 12 great circles, one of which is the meridian of a given place, to intersect each other at the poles of the earth, and divide the equator into 24 equal parts, these are called *HORARY CIRCLES* of that place. If the poles be divided into 24 tenet circles, corresponding to the 24 hours of the day and night, the distance between each two of these is 15°, being the 24th part of 360°.

The *LONGITUDE* of any place on the earth is an arc of the equator intercepted between the meridian passing through that place and another meridian previously agreed upon, called the *primitive meridian*. The longitude is reckoned eastward and westward from the primitive meridian, by which means all places lying in the same hemisphere to the eastward of that meridian, which the first meridian passes, will have east longitude; and all places lying to the westward of that place, will have west longitude.

Geographers at different periods, among different countries, have fixed upon different meridians for the first meridian. The first ancient custom was to make it pass through the city of Alexandria, which was known. Ptolemy, knowing that there is no such place on the earth as can be considered the first meridian, have laid aside that method of reckoning longitude. Ptolemy assumed the meridian passing through the mouth of the Canary Islands as his first meridian. After him, as more countries were discovered in that quarter, the first meridian was removed farther off. The Arabian geographers

first meridian upon the utmost shore of an ocean. Some fixed it to the island of PLAS, near Cape Verd; Hondius to the JAMES; others to the Isle DEL CORVO, or Azores, because there the magnetic needle due north at that time, and it was known, that the deviation of the needle due north is itself subject to variation.

geographers, particularly the Dutch, fixed upon the PIRK OF TENERIFF; the Isle of PALM, one of the Canaries; the French, by order of the king, on the FERRU, another of the Canaries. About regarding any of these rules, geographers often assume the meridian place where they live, or the capital of a country, or its chief observatory, for a meridian. Hence in Great Britain, we reckon longitudes of places eastward and westward from the meridian of London, and longitudes of places in Scotland from that of Edinburgh.

SENSIBLE HORIZON of a place is either sensible or rational. The plane of which touches the surface of the earth at that place, is the **SENSIBLE HORIZON**. A great circle of the sphere, which passes through the place, and is parallel to the plane of the horizon, is the **RATIONAL HORIZON**.

The sensible and rational horizons are defined as two distinct circles of the sphere, seeing that their planes, when produced, are only distant from each other by the earth's semidiameter. It is evident that these circles of the sphere are not, as to sense, to coincide; for the earth's semidiameter, but even the semicircle round the sun, subtends no sensible arc at the distance of the nearest of the stars.

The horizon divides the celestial sphere into two equal portions or hemispheres, the one visible, but the other, by reason of the distance of the body of the earth, is invisible.

SENSIBLE HORIZON of a place is also understood a circle, which determines the limit of the surface of the earth, which is visible; called also the **VISIBLE HORIZON**. It is that this circle will be most accurate at sea, and equally distant every where from the eye of an observer, but below the level of the sea.

It will also be so much the more extensive, as the eye is raised above the earth's surface. The **ZENITH** of a place is the point of the heavenly sphere over the head of an observer; and the point in the opposite hemisphere, directly under his feet; or the zenith and nadir are the poles of the horizon.

Circles of the sphere passing through the zenith and nadir are called **VERTICAL CIRCLES**. They are also sometimes called **MERIDIAN CIRCLES** of the horizon; and in general, a great circle passing through the poles of the sphere is called its **secondary**. That vertical circle which has its plane perpendicular to the plane of the meridian, is called the **PRIME VERTICAL**. The meridian and prime vertical, by their intersections with the horizon divide it into

four equal parts. The points of their intersection are called the **CARDINAL POINTS**. The meridian cuts the horizon at right angles in the north and south points, and the prime vertical cuts it at right angles in the east and west points.

Smaller circles of the sphere parallel to the horizon are called **PARALLELS OF ALTITUDE** or **ALMACANTERS**. These parallels, as well as the vertical circles, may be considered as indefinite in number.

SECT. V. Of the METHODS of FINDING the LATITUDE and LONGITUDE of PLACES.

THE figure and magnitude of the earth being known, it next becomes a problem of the utmost importance in geography, to determine the position of any assigned place upon its surface. This is done by finding its latitude and longitude, for by the first of these is determined the position of the parallel of latitude which passes through that place; and by the second the position of its meridian; and thus the position of the place itself becomes known.

Let $PZEQ$, Plate CLXII, fig. 1. represent the celestial meridian, P the pole of the heavens, EQ the equinoctial, and HO the horizon: Let pLe represent the terrestrial meridian, p the pole, and eq the equator: Let L be any place on the earth, the latitude of which is to be found, and Z its zenith: The arch pL , which is the latitude of the place, evidently contains the same number of degrees as the arch EZ , which is the distance of the equinoctial from the zenith. Now ZO and PE are both quadrants; wherefore the arches, PO and ZE , are equal; but the arch PO is the elevation of the pole above the horizon. Thus it appears, that the latitude of a place is equal to the elevation of the pole above the horizon of that place. There is no star exactly in the pole of the world, but the elevation of the pole may be found by the pole star, which is very near the pole, or by any other circumpolar star in this manner: Let the altitude of the star be taken when it is on the meridian, both above and below the pole, by means of a quadrant or other proper instrument, making the proper corrections for the refraction of the atmosphere: Then, half the sum of these altitudes, reckoned from the north, will be the elevation of the pole, or the latitude of the place at which the observation is made: For let S be the place of the star when above the pole and s its place below the pole, then since $PS = Ps$, it is evident that PO is equal to half the sum of OS and $O s$.

Another method is by means of the declination of the sun, or a star, and one meridian altitude of the same; thus: Having, by means of a quadrant or other instrument, found the zenith distance, Zd , of the luminary, or else its altitude, Hd , and taken its complement, Zd ; then, to this distance add the declination dE , as found by astronomical tables, when the luminary and place are on the same side of the equator, or subtract it when they are on different sides, and the sum or difference will be the latitude EZ sought. By either of these methods, and by many others that could be mentioned, the latitude may be found very accurately.

While

While the earth revolves on its axis from W. to E. the different terrestrial meridians, which are considered as fixed to its surface, are turned in succession towards the sun; and it is noon day at every place when the plane of the meridian of that place passes through his centre; at which time the sun, as seen from that place, appears to be to the S. or N. according as the place happens to be situated to the N. or S. of the parallel of declination, which he describes that day in the heavens. Hence it appears, that all places situated on the same meridian will have their noon at the same instant of time; and that it will be forenoon to all places situated to the W. of that meridian, seeing that the meridians of these places have not yet passed the sun's centre; while on the contrary, it will be afternoon to all places situated to the E. of the meridian passing through the sun, seeing that the meridians of these places have already passed his centre. Since the planes of all the terrestrial meridians pass, one after another, through the sun in 24 hours, it follows that in 1 hour the meridians of two places, whose difference of longitude is the 24th of 360° , or 15° , will have arrived at the sun's centre; and therefore, when it is noon at any place it will want 1 hour from noon at all places upon the meridian 15° to the W. of the meridian of that place, and 2 hours at all places 30° to the W. and so on till we come to the opposite meridian; where the difference of longitude is 180° , at which place it will then be midnight. The contrary happens with respect to places situated to the eastward of the given meridian; for at these places it is past noon, by the same part of 24 hours that the difference between their longitudes, and that of the meridian where it is then noon, is of 360° . The difference between the times of noon, and therefore of all the other hours of the day, at different places of the earth, is the foundation of the methods by which the longitude of any place is found. Suppose that some remarkable phenomenon were to be seen in the heavens, at the same instant of time, throughout all places of that hemisphere of the earth from which the phenomenon was then visible; it is evident from what has been said, that the time of its appearance would be different at different places, according to the meridians happened to be situated in respect of that phenomenon; and that if we knew the longitude of any place, as reckoned from some given meridian where the phenomenon was visible, we should be able to tell the difference between the time of its appearance, as reckoned at that place, and upon the given meridian. Suppose, for example, that the phenomenon was visible at 8 P. M. at some place upon the given meridian, and that another place was 30° of longitude W. from that meridian; then the phenomenon would be seen at 8 P. M. as reckoned at that place. Hence it follows on the contrary, that if we know the times of the appearance of the phenomenon, as reckoned at both these places, we shall also know how many degrees of longitude the one place is eastward or westward from the other. If, for example, it is seen at 9 P. M. at any one place, and at midnight at another place, we may be assured, that the latter place is 45° of longitude E. from the former.

In this way may the longitudes of all places upon the earth's surface be found. These phenomena to be observed at these places are eclipses of the sun and moon; eclipses of the satellites, and particularly of his first satellite; and particularly of his first satellite; and lastly, the angular distance of the moon from the sun, and from the fixed stars.

The eclipses of JUPITER'S SATELLITES frequently happen, and which may be observed on shore, would afford to the navigator a method of finding his longitude, if it were possible to observe them at sea; but that has not yet been made to overcome the attendant on such observations, by the irregular motions of the vessel, have been hitherto unsuccessful. Navigation and geography have received great advantages from these eclipses, especially from the eclipses of the first satellite, the commencement and the end of which may be served with precision. It is indeed now known also the hour at which any eclipse may be seen under a known meridian; and it is by the difference of these hours that the longitude is found; but the tables of the eclipses are now brought to such a degree of accuracy as to give the times of these eclipses with precision almost equal to that of the observations themselves. The great difficulty of observing eclipses at sea has rendered it necessary to observe other celestial phenomena; and the motions of the moon are the only ones which are generally useful for the determination of longitude. The position of the moon, as it appears if seen from the centre of the earth, may easily be found at any time, by taking the distances from the sun or stars by a prominent object. These being found, the tables of the eclipses give the hour as reckoned at the first meridian, when she ought to have had that position, as a comparison of this time, with the time reckoned on board of the vessel when the observation was made, the navigator is enabled to find his longitude.

To estimate the accuracy of this method must be considered, that in consequence of the error of observation, the place of the moon determined by the observer, does not exactly correspond to the hour pointed out by his tables; and that in consequence of errors in the tables, the same place does not exactly correspond to the hour at which the observation was made, as reckoned at the first meridian. The difference of these hours is not therefore that which results from an observation perfectly made, with tables rigorously exact. Suppose the amount of the error was one minute in the tables, it would correspond to an error of 15° of longitude, or 15 geographical miles at the equator. It would, however, be less upon any other part of the N. or S. of the equator. Besides, it is diminished by numerous and repeated observations made upon the distances of the moon from the sun and from the stars, to the end that the errors of observation and of the tables mutually destroy each other. It is evident that errors in the longitude, arising from the

d in the observations, will be so much as the motion of the celestial body, upon which observations are made, is the more distant it appears, that observations made upon the moon, when at her least distance from us, are preferable to those made upon her when at her greatest distance. If the motion of the moon is only about one 13th of that of the sun, it is evident that the errors in the observations would be 13 times greater: from which it is evident that the moon is the only celestial body employed to determine the longitude. It also appears of what importance it is to the art of navigation and geography, that tables should be constructed of her mo-

on observations the longitudes and latitudes of a great number of places have been determined, and the position and extent of many countries accurately defined, concerning which erroneous opinions formerly were entertained. Much, however, yet remains to be done: vast parts of Africa and America are yet to be measured entirely unknown, and even those frequently visited by navigators may have positions more accurately determined than hitherto done.

For the methods of finding the longitude stated of, there is yet another much used, to which, to whom an exact knowledge of time, when at sea, and without any other than the stars and compass, is of the greatest importance. It has been already observed, that in order to know the longitude of any place, it is necessary to know the difference between the time of noon, or of any other hour, at that place, and the time of noon, or of the same hour, at any place upon the first meridian; for the difference of time the longitude may be found, allowing 15° of longitude for every hour, and so in proportion for any period of time.

It appears, that if a traveller, or navigator, carries with him a watch, or time-keeper, so regulated as to show exactly the hours as reckoned at the place from which he starts; by comparing the time shown by the watch with the time as reckoned at any place he visits, or as found by means of proper astronomical observations at that place, it is evident that he immediately finds its longitude. If, in departing from the first meridian, he had known from any other meridian whose longitude the first meridian was known, still it is evident that the longitude is to be found by the same method of observation. This method of finding longitude would be the most simple of all, if it were not a matter of great difficulty to carry time-keepers that shall go with perfect accuracy; more especially on board of a ship, where they are continually exposed to changes of position as well as continual agitation. The watches that occur have however been over-perfected and ingenuity; and watches have been constructed that have gone with great accuracy for many months. See LONGITUDE.

SECT. VI. Of the DIFFERENT POSITIONS of the SPHERE.

If we could suppose an inhabitant of the earth capable of living at either of the poles, he would have always one of the celestial poles in his zenith and the other in his nadir, the equator coinciding with the horizon. Hence all the celestial parallels, are also parallel to the horizon; and hence a person, or people, are said to live in a PARALLEL SPHERE, or to have a parallel horizon.

Those who live under the equator have both poles in the horizon, all the celestial parallels cutting the horizon at right angles; whence they are said to live in a RIGHT SPHERE, or to have a RIGHT HORIZON.

Those who live between either of the poles and the equator are said to live in an OBLIQUE SPHERE, or to have an oblique horizon; because the celestial equator cuts his horizon obliquely, and all the parallels in the celestial sphere have their planes oblique to that of the horizon. In this sphere some of the parallels intersect the horizon at oblique angles, some are entirely above it, and some entirely below it; all of them, however, so situated, that they would obliquely intersect the plane of the horizon extended.

The largest parallel, which appears entire above the horizon of any place in N. latitude, is called by the ancient astronomers the ARCTIC CIRCLE of that place. Within this circle, i. e. between it and the arctic pole, are comprehended all the stars which never set in that place, but are carried perpetually round the horizon, in circles parallel to the equator.

The largest parallel, which is hid entirely below the horizon of any place in N. latitude, was called by the ancient astronomers the ANTARCTIC CIRCLE of that place by the ancients. This circle comprehends all the stars which never rise in that place, but are carried perpetually round below the horizon, in circles parallel to the equator.

In a parallel sphere, however, the equator may be considered as both arctic and antarctic circles; for being coincident with the horizon, all the parallels on one side are entirely above it, and those on the other entirely below it. In an oblique sphere, the nearer any place is to either of the poles the larger are the arctic and antarctic circles, as being nearer to the celestial equator, which is a great circle. In a right sphere, the arctic and antarctic circles have no place; because no parallel appears either entirely above or below it.

By the ancients the arctic circle was called *maximus semper apparentium*, and *circulus perpetue apparitionis*; the antarctic circle on the other hand, being named *maximus semper occultarum*, and *circulus perpetue occultationis*.

By the arctic and antarctic circles, however, modern geographers in general understand two fixed circles, at the distance of 23½ degrees from the poles. These mark out the space all round the globe where the sun appears to touch the horizon at midnight in mid-summer, and to be entirely sunk below it in winter.

According to the different positions of the globe with regard to the sun, the celestial bodies exhib-

but different phenomena to the inhabitants. Thus, in a parallel sphere, they appear to move in circles round the horizon; in a right sphere, they appear to rise and set as at present, but always in circles cutting the horizon at right angles; but in an oblique sphere, the angle varies according to the degree of obliquity, and the position of the axis of the sphere with regard to the sun. The phenomena thence arising will be sufficiently understood from what is said under the article ASTRONOMY. From thence we will easily perceive the reason of the sun's continual change of place in the heavens: but though it is certain that this change takes place every moment, it is imperceptible for some time, unless by very nice astronomical observations. Hence we may generally suppose the place of the sun to be the same for a day or two together, though in a considerable number of days it becomes exceedingly obvious to every body. When he appears in the celestial equator, his motion seems for some time to be in the plane of that circle, though it is certain that his place there is only for a single moment; and in like manner, when he comes to any other point of the heavens, his apparent diurnal motion is in a parallel drawn throughout. Twice a year he is in the equator, and then the days and nights are nearly equal all over the earth. This happens in March and September; after which, the sun proceeding either northward or south, according to the season of the year, and the position of the observer, the days become longer or shorter than the nights, and summer or winter comes on, as is fully explained under the article ASTRONOMY.

The recession of the sun from the equator either northward or southward is called his DECLINATION, and is either north or south according to the season of the year; and when this declination is at its greatest height, he is then said to be in the tropic.

The space between the two tropics, called the TORRID ZONE, extends 47 degrees of latitude all round the globe; and throughout the whole of that space the sun is vertical to some of the inhabitants twice a year, but to those who live directly under the tropics only once. Throughout the whole torrid zone also there is little difference between the length of the days and nights. The ancient geographers found themselves considerably embarrassed in their attempts to fix the northern tropic; for though they took a very proper method, namely, to observe the most northerly place where objects had no shadow on a certain day, yet they found that on the first day no shadow was cast for a space of no less than 400 stadia. The reason of this was, the apparent diameter of the sun; which being about half a degree, seemed to extend himself over as much of the surface of the earth, and to be vertical every where within that space.

When the sun is in or near the equator, he seems to change his place in the heavens most rapidly; so that about the equinoxes one may very soon receive the declination in a day or two: he approaches the tropics this apparent change gradually; however, so that for a day or two he seems to move at all.

From these facts it may be understood from

any map on which the ecliptic is described by drawing lines through every degree parallel to the equator, we shall perceive they all approach nearer and nearer each other at last, when we approach the point betwixt the ecliptic and tropic, several degrees scarce be distinguishable.

SECT. VII. METHOD of FINDING of the DAY, and the BEGINNING of the TWILIGHT.

As it is of considerable importance in geography, to know the length of the assigned place upon the earth, it will be proper to shew the manner of finding the time of the rising and setting of the sun, or any other of the celestial bodies. Let $PZES$, Plate CLXII, Fig. 2. represent the celestial meridian of any place, P and Z the poles of the sphere; let EQ be the horizon, stereographically projected upon the plane of the meridian; let I be the 6 o'clock hour circle, and m the circle of declination described by the sun on any given day of the year; the point in which it cuts the horizon; then n half the arch described by the sun within the horizon, and $O m$ the half of the arch when below the horizon. Let POS be the hour circle passing through the sun in the horizon, and meeting the equator at A ; the arch EA of the equator intercepted between the meridian and hour circle, and converted into time, (allowing 15 degrees will evidently give half the time the sun remains above the horizon, as it will give half the time it remains below the horizon. As the arch EC contains 90 degrees, it is only necessary to find the arch CA which is called the sun's ascension, it being the difference between the sun's declination and his oblique ascension; converted it into time to add it to, or subtract it from six hours, according as the place and sun's declination are of contrary names, that is both N. or both S. and the other S. and the difference shall be half the length of the day required.

In the spherical triangle CAO , CA is the sun's declination, to be found from astronomy; the angle ACO the complement of the sun's latitude, in order to find AO the sun's ascension. Hence from the principles of trigonometry we have the following proportion:

As radius to the tangent of the latitude, so the tangent of the sun's declination to the tangent of the sun's ascension required.

When the sun is in the same hemisphere as the place, and his declination is the complement of its latitude, which happens at places in the polar circle the circle of declination will not cut the horizon, and consequently the sun will not set during the time his declination exceeds the latitude, but when the sun and place

ever, then he will never rise at that declination exceeds the colatitude it is easy to see how to find the sun begins to shine constantly upon : within the polar circle ; and also that place begins to be wholly in considerable time together.

observed in ASTRONOMY, Part III, twilight commences in the morning, when the sun is 18° from the zenith. The time of its commencement, may be found by spherical trigonometry : *Plate CLXII, fig. 2.* Let h , P the pole of the sphere, and T the sun, 18° below the horizon HR . In triangle PZT , we have PZ the pole from the zenith, which is the latitude of the place, and PT the sun's declination ; also ZT , the sun from the zenith, which, in ways $90^\circ + 18^\circ$ or 108° . From find the hour angle, ZPT , which the following proportion. Let V of the triangle. Then as sine ZP radius square, so is sine $(V - ZP)$ T to the square of the sine of $\frac{1}{2}$ angle ZPT being turned into time from noon of the beginning or twilight.

of the DIVISION of the EARTH'S SURFACES and ZONES ; and the DISPOSITION of SHADOWS of BODIES.

ing the diversity in the length of days, the rising and setting of the other phenomena already mentioned geographers divided the surface of certain districts, which they call ; and instead of the method of designation of places by their latitude as we do now, they contented themselves with the climate in which they

When more accuracy was required also the beginning, middle, and the climates.

ion, however, was certainly very inaccurate : for the only method they had the difference was by the length of climate, according to them, was had the day in its most northerly or longer than in the most southerly. ing of their first climate, they took der which the day is $12\frac{1}{2}$ hours of the world which lie nearer being supposed to be in any climate in a loose sense they may be a right sphere, or because they or thought to be uninhabitable by t. The northern climates were general : seven ; which must have an equal bern climates corresponding with them climates, according to the as follow : 1. Merue. 2. Syene in Alexandria in Egypt. 4. Rhodes, according to others, a parallel the Hellespont. 6. The parallel the mouth of the river Boristheiphean mountains.—Each of these

T 1.

places was supposed to be in the middle of the climate ; and as the southern parts of the globe were then very little known, the climates to the S. of the equator were supposed to be as far distant from that circle as the northern ones ; in consequence of which they took their names from the latter.

A parallel was said to pass through the middle of a climate, when the day under that parallel is a quarter of an hour longer than that which passes through the most southerly part. Hence it does not divide the space into two equal parts, but that part next the equator will always be the larger of the two ; because the farther we recede from that circle, the less increase of latitude will be sufficient to lengthen the day a quarter of an hour. Thus, in every climate there are 3 parallels ; one marking the beginning, the 2d the middle, and the 3d the ending of the climate ; the ending of one being always the beginning of another. Some of the ancients divided the earth by these parallels ; others by a parallel did not mean a mere line, but a space of some breadth : and hence the parallel may be understood as the same with half a climate.

This method of dividing the surface of the earth into climates, though now very much disused, has been adopted by several modern geographers. Some of these begin their climates at the equator, reckoning them by the increase of half an hour in the length of the day northward. Thus they go on till they come to the polar circles, where the longest day is 24 hours : betwixt these and the poles they count the climates by the increase of a natural day in the length of time that the sun continues above the horizon, until they come to one where the longest day is 15 of ours, or half a month ; and from this to the pole they count by the increase of half months or whole months, the climates ending at the poles where the days are six months long. The climates betwixt the equator and the polar circles are called *hour climates*, and those between the polar circles and the poles are called *month climates*.—In common language, however, we use the word CLIMATE in a very different sense ; so that, when two different countries are said to be in different climates, we understand only that the temperature of the air, seasons, &c. are different.

The division of the earth into zones has arisen from the various appearances of the sun, and the effects of his light and heat upon different parts of it. These are five in number : 1. The torrid zone, lying between the two tropics for a space of 47° of latitude. This is divided into two equal parts by the equator ; and the inhabitants have the sun vertical to them twice a-year, excepting only those who dwell under the tropics, to whom he is vertical only once. 2. The two temperate zones lie between the polar circles and the tropics, containing a space of 43° of latitude. And, 3. The two frigid zones lie between the polar circles and the poles. In these last the longest day is never below 24 hours ; in the temperate zones it is never quite so much, and in the torrid zone it is never above 12. The zones are named from the degree of heat they were supposed to be subjected to. The torrid zone was supposed by the ancients to be

T 2

be.

be uninhabitable by reason of its heat; but this is now found to be a mistake, and many parts of the temperate zones are more intolerable in this respect than the torrid zone itself. Towards the polar circles, also, these zones are intolerably cold during winter. Only a small part of the northern frigid zone, and none of the southern, is inhabited. Some geographers reckoned six zones, dividing the torrid zone into two by the equator.

When any parts of the heaven or earth are said to be on the RIGHT or LEFT, we are to understand the expression differently according to the profession of the person who makes use of it: because according to that, his face is supposed to be turned towards a certain quarter. A geographer is supposed to stand with his face to the north, because the northern part of the world is best known. An astronomer looks towards the south, to observe the celestial bodies as they come to the meridian. The ancient augurs, in observing the flight of birds, looked towards the east; while the poets look towards the *Fortunate Isles*. In books of geography, therefore, by the right hand we must understand the east: in those of astronomy, the west; in such as relate to augury, the south; and in the writings of poets, the north.

From the difference in the length and positions of the shadows of terrestrial substances, ancient geographers have given different names to the inhabitants of certain places of the earth; the reason of which will be easily understood from the following considerations. 1. As the sun in his apparent annual revolution never removes farther from the equator than $23\frac{1}{2}$ degrees, none of those who live without that space, or beyond the tropics, can have that luminary vertical to them at any season of the year. 2. All who live between the tropics have the sun vertical twice a year, tho' not all at the same time. Thus to those who live directly under the equator, he is directly vertical in March and Sept. at the equinox. If a place is in 10° N. lat. the sun is vertical when he has 10° north declination; and so of every other place. 3. All who live between the tropics, have the sun at noon sometimes N. and sometimes S. of them. Thus, they who live in a place situated in 20° N. lat. have the sun at noon to the northward when he has more than 20° N. declination, and to the southward when he has less. 4. Such of the inhabitants of the earth as live without the tropics, if in the northern hemisphere, have the sun at noon to the S. of them, but to the N. if in the southern hemisphere. 5. When the sun is in the zenith of any place, the shadow of a man, or any upright object, falls directly upon the place where they stand, and consequently is invisible; whence the inhabitants of such places were called ASCIT, or without shadows: those who live between the tropics, and have the sun sometimes to the N. and sometimes to the S. of them, have of consequence their shadows projecting N. at some seasons of the year, and S. at others; whence they were called AMPHISCIT, having two kinds of shadows. They who live without the tropics have their noon shadows always the same way; and are therefore called HETEROSCIT, that is, having only one kind of shadow. If they are in N. lat. the shadows are always turned towards the N.

and if in the southern hemisphere, towards the S. When a place is so far distant from the equator that the days are 24 hours long or long, the inhabitants were called PERISCIT; because the sun always turns round them.

Names have likewise been given to the different parts of the earth, from 11 of latitude under which they live; and from the position with regard to one another. The places are so near each other, that they have only one horizon, or at least that the perceptible difference between them, the inhabitants were called SYNOECIT, that is, living under the same sky; the seasons, days, nights, &c. being perfectly alike. Those who live in distant places, but under the same parallel, were called PEROECIT; that is, living in the same latitude. Those who are on the same side of the equator, have the seasons of the year at the same time, but if on different sides, the summer of one is the winter of the other; as explained in ASTRONOMY. Some writers, however, have named of *Perioeci*, distinguish those who live under opposite points of the same parallel, noon of the one is the midnight of the other; the two places lie under parallels equally distant from the equator, but in opposite hemispheres. The inhabitants were called ANTOECIT. The similar increase of days and nights, and seasons, but in opposite months. According to the Antioeci were such as lived under the same geographical meridian, and had day at the same time. If two places are in equal distance from the equator, and under the same meridian, the inhabitants were called THOECIT, with respect to one another. When two persons are Antipodes, the one is the nadir of the other. The elevation of the pole, but it is the same at both poles: they have also days and night similar seasons of the year; but they have different hours of the day and night, as well as seasons of the year. Thus, when it is mid-day with us, it is midnight with our Antipodes. When it is summer with us, it is winter with them.

SECT. IX. Of the CONSTRUCTION OF MAPS.

A MAP is a plane figure representing the earth, or some part of it; by the projection of its globular surface, exhibiting seas, rivers, mountains, cities, &c. in their true positions, or nearly so. Maps are either *Universal*, or *Particular*.

UNIVERSAL, or GENERAL MAPS, exhibit the whole surface of the earth in its hemispheres.

PARTICULAR, or PARTIAL MAPS, exhibit some particular part or region of the earth.

Both kinds are usually called *Geographical*, or *Land* MAPS, as distinguished from *Marine*, or *Sea* MAPS; which represent the sea and sea coasts, and are properly called *CHARTS*.

Maps are constructed by making a projection of the globe, or a part of it, either on

or circle, or by the eye placed in
or point, according to the rules of
kc. of which there are several me-

surface can no way be represented exactly upon a
plane. Then the several countries, kingdoms, ci-
ties, seas, islands, sea coasts, towns, &c. are to
be marked in the map, according to their latitudes
and longitudes.

In filling up the map, all places representing land
are filled with such cities, towns, rivers, hills, &c.
as the countries contain; but the seas are left
white; the shores adjoining to them being shaded.
Large rivers are marked by strong or double lines,
drawn winding in the form of those they repre-
sent; and small rivers are expressed by small
lines. Different countries are best distinguished
by different colours; at least the borders of them
should be so distinguished. Forests are represented
by small trees; and mountains are shaded to make
them appear. Sands are denoted by numerous
small points; and rocks under water by small
crosses. The mariner's compass, with the 32
points representing the winds, is drawn in any
void space.

II. CONSTRUCTION OF PARTICULAR MAPS.
To draw a map of any particular country, its extent
must be known as to latitude and longitude: as,
Suppose Spain, lying between the N. latitudes 36°
and 44°, and extending from 10° to 23° of longitude.
So that its extent from N. to S. is 8° and from E.
to W. 13°.

1. Draw the line AB, fig. 7. plate CLXII, for a
meridian passing through the middle of the coun-
try; on this, set off 8° from B to A, taken from
any convenient scale; A being the north and B
the south point. Through A and B draw the per-
pendiculars CD, EF, for the extreme parallels
of latitude. Divide AB into 8 parts or degrees,
through which draw the other parallels of latitude,
parallel to the former.

For the meridians, divide any degree in AB in-
to 60 equal parts, or geographical miles. Then,
because the length of a degree in each parallel de-
creases towards the pole, (as appears from the
annexed TABLE,) take the number of miles an-
swering to the latitude of B, which is 48½ nearly,
and set it from B, 7 times to E, and 6 times to
F; so is EF divided into degrees. Again, from
the same table take the number of miles of a de-
gree in the latitude A, viz. 43½ nearly; which set
off, from A, seven times to C, and six times to D.
Then from the points of division in the line CD,
to the corresponding points in the line EF, draw
so many right lines for the meridians. Number
the degrees of latitude up both sides of the map,
and the degrees of longitude on the top and bot-
tom. Also in some vacant place make a scale of
miles; or of degrees, if the map represent a large
part of the earth; to serve for finding the distan-
ces of places upon the map.

Then make the proper divisions and subdivisions
of the country: and having the latitudes and lon-
gitudes of the principal places, it will be easy to
set them down in the map; for any town, &c.
must be placed, where the circles of its latitude
and longitude intersect. For instance, OIBAAI-
TAR, whose lat. is 36° 21' and lon. 12° 27' will
be at G; and MADRID, whose lat. is 40° 10' and
lon. 14° 44', will be at M. In like manner, the
mouth of a river must be set down; but to de-
scribe the whole river, the lat. and lon. of var-

ry turning must be marked down, and the towns and bridges by and under which it runs. And so for woods, forests, mountains, lakes, forts, &c. The boundaries will be described by setting down the most remarkable places on the sea coast, and drawing a continued dotted line through them all. This method is very proper for small countries.

TABLE, showing the NUMBER of MILES contained in a DEGREE of LONGITUDE, in each PARALLEL of LATITUDE from the EQUATOR.

2. Maps of particular places, being portions of the globe, may be drawn after the same manner as the whole: *i. e.* either by the orthographic or stereographic projection of the sphere. But in partial maps, an easier method may be taken; thus: having drawn the meridian AB, *fig. 7*, and divided it into equal parts, as in the last method, draw lines through all the points of division perpendicular to AB, for the parallels of latitude; CD, *fig. 7*, being the extreme parallels. Then, to divide these, set off the degrees in each parallel, diminished as directed for the two extreme parallels

P. in the last method; and through all the ^{dividing} points draw the meridians, which ^{are} *fig. 7*; and which were right lines in ^{the last method} because only the extreme paral-

lles were divided by the table. This method is proper for a large tract, as Europe, &c. in the parallels and meridians need only every 5 or 10 degrees. This method is used in drawing maps; as all the parts of their due magnitude, but a little towards the outside, from the obliquity of the meridians and parallels.

3. A 3d method may be adopted for a meridian: Divide it into 9 equal parts through the points of division, describe circles for the parallels of latitude, centre P, which represents the pole. *fig. 8*, the height of the map; then CE parallel passing through the greatest latitude EF will represent the equator. Divide EF into equal parts, of the same length in AB, both ways, beginning at B. All the parallels into the same number of parts, but lesser, in proportion to the for the several latitudes, as directed in the method for the rectilinear parallels. Through all the corresponding divisions, draw lines which will represent the meridians, the ones being EC and ED. Lastly number the degrees of lat. and lon., and place a scale of parts, either of miles or degrees for distances. This is a very good method for large maps, and is called the GLOBULAR METHOD; all the parts of the earth being nearly of their due magnitude, except the outside, are a little distorted on the outside.

When the place of which a map is to be drawn is but small, *e. g.* if a country were to be drawn, the meridians, as to sense, will be parallel, and the whole will differ very little from a plane. Such a map may be made more exact than by the preceding rules, merely by the distances in miles, and so laying it out in a plane rectangular map. But the map making belongs more properly to the ART, which see.

The USE OF MAPS is obvious from the construction. The degrees of the meridians shew the latitudes and longitude, and the scale of miles annexed, their distance from places, with regard to each other, as to the cardinal points, appearance; the top of the map being always the north, the bottom the south, the right the east, and the left the west, unless the compass, shew the contrary.

SECT. X. GENERAL DESCRIPTION. REPRESENTATION of the SPHERE.

HAVING discovered, by maps, one way, the true situation of the different parts of the earth with regard to each other, we know many other particulars relative to them, as, their distance from us, the hour of the season of the year, &c. at a particular place. As each of these problems would require a particular and tedious calculation, machines have been invented by which all the calculations may be made, and every problem in geography may be

GEOGRAPHY.

Fig. 1.
Terrestrial Globe.

Fig. 4.

Fig. 5.

Fig. 3. Celestial Sphere.

Fig. 2. Armillary Sphere.

and in the most easy and expeditious these machines are the celestial and globes, and the armillary sphere; of which I now give a description, with the using them.

of the world be accurately delineated on a ball, the surface thereof will represent the surface of the earth: for the bulk of the ball is inconsiderable with respect to that of the globe: that they take off no more from its surface than grains of sand do from the round common globe: the diameter of the globe is 8000 miles, and no known hill upon the surface exceeds three miles in perpendicular height.

any observer placed any where in the indeterminate space where there is nothing to limit his view, remote objects would appear equally distant from him; and to be placed in a vast concave, of which his eye is the centre. The objects which are nearer to us than the sun; some are sometimes nearer and sometimes farther from us than the sun; others never come nearer to us as the sun always is: the remotest star system is beyond comparison nearer to us than any of the fixed stars are; and yet, all celestial objects appear equally distant from the eye, if we suppose a large hollow sphere to have as many bright studs fixed to its surface as there are stars visible in the heaven, and to be of different magnitudes, and at the same angular distances from each other as the stars are; the sphere will be a true representation of the starry heaven, to an eye situated in its centre, and viewing it all around, as if it were a small globe, with a map of the earth painted on its surface.

placed on an axis in the centre of this sphere, and the sphere be made to turn round this axis, it will represent the apparent motion of the heavens round the earth.

A circle be so drawn upon this sphere, as to divide it into two equal parts or hemispheres, and one of the circle be perpendicular to the axis of the sphere, this circle will represent the celestial equator, which divides the heaven into two parts, called the *northern* and the *southern* hemisphere; and every point of that circle will be distant from the POLES, or ends in the axis, in the same manner as the poles of the earth are.

That pole which is in the middle of the northern hemisphere will be called the *north pole* of the sphere, and that which is in the middle of the southern hemisphere the *south pole*.

Another great circle be drawn upon the sphere, in the same manner as to cut the equinoctial at an angle of 23½ degrees in two opposite points, it will represent the ECLIPHTIC, or circle of the sun's annual motion; one half of which is on the north side of the equinoctial, and the other half on the south.

The sun may be made to move eastward in this manner as to go quite round it, in the same manner as the sphere is turned round westward upon its axis, this stud will represent the sun, changing his place every day a 365th part of the ecliptic, and going round westward as the stars do; but with a motion slower than the motion of the stars, he will make 366 revolutions about the axis in the time that the sun makes only

365. During one half of these revolutions, the sun will be on the north side of the equinoctial; during the other half, on the south; and at the end of each half, in the equinoctial.

If we suppose the terrestrial globe in this machine to be about one inch in diameter, and the diameter of the starry sphere to be about 5 or 6 feet, a small insect on the globe would see a very little portion of its surface; but it would see one half of the starry sphere, the convexity of the globe hiding the other half from its view. If the sphere were turned westward round the globe, and the insect could judge of the appearances which arise from that motion, it would see some stars rising to its view in the eastern side of the sphere, whilst others were setting on the western; but as all the stars are fixed to the sphere, the same stars would always rise in the same points of view on the E. side, and set on the same points of view on the W. side. With the sun it would be otherwise; because the sun is not fixed to any point of the sphere, but moves slowly along an oblique circle in it. And if the insect should look towards the south, and call that point of the globe, where the equinoctial in the sphere seems to cut it on the left side, the east point; and where it cuts the globe on the right side, the west point; the little animal would see the sun rise north of the east, and set north of the west, for 182½ revolutions; after which, for as many more, the sun would rise south of the east, and set south of the west. And in the whole 365 revolutions, the sun would rise only twice in the east point, and set twice in the west.

All these appearances would be the same, if the starry sphere stood still (the sun only moving in the ecliptic), and the earthly globe were turned round the axis of the sphere eastward. For, as the insect would be carried round with the globe, he would be quite insensible of its motion, and the sun and stars would appear to move westward.

SECT. XI. DESCRIPTION of the TERRESTRIAL GLOBE.

THE equator, ecliptic, and tropics, polar circles, and meridians, are laid down upon the globe in the manner already described. The ecliptic is divided into 12 signs, and each sign into 30 degrees. Each tropic is 23½ degrees from the equator, and each polar circle is 23½ degrees from its respective pole. Circles are drawn parallel to the equator, at every 10 degrees distance from it on each side of the poles: these circles are called *parallels of latitude*. On large globes there are circles drawn perpendicularly thro' every 10th degree of the equator, intersecting each other at the poles; but on the globes of or under a foot diameter, they are only drawn through every 15th degree of the equator: these circles are generally called *meridians*, sometimes *circles of longitude*, and at other times *hour-circles*.

The globe is hung in a brass ring, A, fig. 1, plate CLXIII, called the *brazen meridian*, and turns upon a wire in each pole sunk half its thickness into one side of the meridian ring; by which means that side of the ring divides the globe into two equal parts, called *eastern* and *western* hemispheres.

The globe is hung in a brass ring, A, fig. 1, plate CLXIII, called the *brazen meridian*, and turns upon a wire in each pole sunk half its thickness into one side of the meridian ring; by which means that side of the ring divides the globe into two equal parts, called *eastern* and *western* hemispheres.

The globe is hung in a brass ring, A, fig. 1, plate CLXIII, called the *brazen meridian*, and turns upon a wire in each pole sunk half its thickness into one side of the meridian ring; by which means that side of the ring divides the globe into two equal parts, called *eastern* and *western* hemispheres.

spheres; as the equator divides it into two equal parts, called the *northern* and *southern hemispheres*. The ring is divided into 360 equal parts or degrees, on the side wherein the axis of the globe turns. One half of these degrees are numbered, and reckoned from the equator to the poles, where they end at 90. Their use is to show the latitudes of places. The degrees on the other half of the meridian are numbered from the poles to the equator, where they end at 90: Their use is to show how to elevate either the north or south pole above the horizon, according to the latitude of any given place, as it is N. or S. of the equator.

The brazen meridian is let into two notches made in a broad flat ring called the *wooden horizon*, B, C.; the upper surface of which divides the globe into two equal parts, called the *upper* and *lower hemispheres*. One notch is in the north point of the horizon, and the other in the south. On this horizon are several concentric circles, which contain the months and days of the year, the signs and degrees answering to the sun's place for each month and day, the 32 points of the compass, and the circles of amplitude and azimuth. The graduated side of the brass meridian lies towards the east side of the horizon, and should be generally kept towards the person who works problems by the globes.

There is a small horary circle D, so fixed to the north part of the brazen meridian, that the wire in the north pole of the globe is in the centre of that circle; and on the wire is an index, which goes over all the 24 hours of the circle, as the globe is turned round its axis. Sometimes there are two horary circles, one between each pole of the globe and the brazen meridian.

There is a thin slip of brass, called the *QUADRANT OF ALTITUDE*, which is divided into 90 equal parts or degrees, answering exactly to 90 many degrees of the equator. It is occasionally fixed to the uppermost point of the brazen meridian by a nut and screw. The divisions end at the nut E, and the quadrant is turned round upon it.

There is also applied occasionally to the globe a magnetic needle, freely moving over a circle divided into four times 90 degrees; reckoning from the N. and S. points towards the E. and W. and also into the 32 points of the compass. As this needle makes nearly a certain constant angle with the meridian in every place, called the *variation*; therefore this compass, being added to the frame, will rectify the position of the meridian of the globe when the variation of the needle is known. Thus at London, the variation of the needle is at this time about 23 degrees northward; therefore, by moving the frame of the globe about till the needle settles itself over the 23d degree, reckoning westward from the north point or *fleur de lis*, we shall have the brass meridian coinciding with the true meridian. The compass is sometimes fixed between the legs underneath the globe.

SECT. XII. DESCRIPTION and USE of the ARMILLARY SPHERE.

THE exterior parts of this machine are, a compass of brass rings, (See Plate CLXIII. fig. 2.)

which represent the principal circles viz. 1. The equinoctial, AA, which to 360 degrees (beginning at its intersection in Aries), for showing his right ascension in degrees; and also into showing his right ascension in time. 2. The ecliptic, BB, which is divided into 12 signs into 30 degrees, and also into 12 days of the year; in such a manner, that the degree or point of the ecliptic in which on any given day, stands over that circle of months. 3. The tropic of Cancer touching the ecliptic at the beginning in ♋, and the tropic of Capricorn touching the ecliptic at the beginning of ♎ each 23½ degrees from the equinoctial. The arctic circle E, and the antarctic circle F, each 23½ degrees from its respective pole. 4. The equinoctial circle GG, touching the north and south poles of the globe, and passing through the equinoctial points Aries and Libra, in the ecliptic. 5. The tropic of Cancer HH, passing through the poles of the ecliptic, and through the solstitial points Cancer and Capricorn in the ecliptic. Each quarter of these circles is divided into 90 degrees, from the equinoctial to the poles of the world, showing the declination of the sun, moon, and each quarter of the latter, from the equator to its poles, and the latitude of the stars.

In the north pole of the ecliptic, which is fixed one end of a quadrant to the other end a small sun Y, will revolve round the ecliptic BB, by turning in the south pole of the ecliptic, which is another quadrantal wire, upon which is a small moon Z upon it, which may be moved by the hand; but there is a particular contrivance for causing the moon to move in a circle which crosses the ecliptic at an angle of 5 degrees, two opposite points called the *moon's nodes*, also for shifting these points back and forth in the ecliptic, as the moon's nodes shift in.

Within these circular rings is a flat globe I, fixed on an axis KK, which has the north and south poles of the globe to those of the celestial sphere at L. This axis is fixed the flat celestial meridian which may be set directly over the place on the globe, and then turned round the globe, so as to keep still the L upon it. This flat meridian is graduated in degrees, as the brass meridian of a common globe; its use is much the same. To this is added the moveable horizon MM, so as to be fixed to two strong wires proceeding from its points to the globe, and entering the opposite point of its equator, where the moveable brass ring is let into the globe around its equator. The globe may be turned within this ring, so as to place the meridian upon it, directly under the ecliptic LL. The horizon is divided into degrees all around its outermost edge, and the points of the compass for the altitude of the sun and moon both in

celestial meridian I. J., passes through the north and south points of the a common globe; but here, if the globe is round, the horizon and meridian

At the south pole of the sphere is a wire, fixed to the rings: and on the wire which goes round that circle, if turned round its axis.

fabric is supported on a pedestal N, elevated or depressed upon the joint number of degrees from 0 to 90, by arc P, which is fixed in the strong and slides in the upright piece R, in order to fix it at any other proper

There are two wheels (as in Dr Long's two positions, whose axes come out either of which may be turned by wheel W. When the winch is put upon and turned backward, the terrestrial horizon and celestial meridian, and the whole sphere of circles turn about, by south, to west, carrying the moon Z, round the same way, hem to rise above and set below the it when the winch is put upon the turned forward, the sphere with the meridian keep at rest; and the earth, with its meridian, turn round from W. by S. to the same points of the horizon to the S, to which these bodies came when at rest and they were carried round but they rise and set in the same points as, and at the same time in the hour as the motion be in the earth or in

If the earthly globe be turned, the sphere round its hour circle; but if the wheel, the hour circle goes round backward. And thus, by this construction, is equally fitted to show either the of the earth or the apparent motion

the sphere for use, first slacken the upright stem R, and taking hold of move it up or down until the given latitude for any place be at the side of and then the axis of the sphere will be elevated so as to stand parallel to the world, if the machine be set north and south compass: This done, count the north pole, upon the celestial meridian towards the north notch of the set the horizon to that latitude; then until the sun Y comes to the given in the ecliptic, and the sun will be place for that day: find the place of ascending node, and also the place of an ephemeris, and set them right: lastly, turn the winch W, until it comes to the meridian I. J., or until comes to the sun (according as you here or earth to move), and set the XII, marked noon, and the whole be rectified. Then turn the winch, when the sun and moon rise and set, and the hour index will show the for the given day.

who understand the use of the globes

will be at no loss to work many other problems by this sphere, it is needless to enlarge any farther upon it.

SECT. XIII. DIRECTIONS for USING the TERRESTRIAL GLOBE.

In using globes, keep the east side of the horizon towards you (unless the problem requires to turn it), which side may be known by the word East upon the horizon; for then you have the graduated side of the meridian towards you, the quadrant of altitude before you, and the globe divided exactly into two equal parts, by the graduated side of the meridian.

In working some problems, it will be necessary to turn the whole globe and horizon about, that you may look on the west side thereof; which turning will be apt to jog the ball so, as to shift away that degree of the globe which was before set to the horizon or meridian to avoid which inconvenience, thrust in the leather end of a quill between the ball of the globe and the brazen meridian; which, without hurting the ball, will keep it from turning in the meridian, whilst you turn the west side of the horizon towards you.

PROB. I. To find the latitude and longitude of any given place upon the globe.—Turn the globe on its axis, until the given place comes exactly under that graduated side of the brazen meridian on which the degrees are numbered from the equator; and observe what degree of the meridian the place then lies under; which is its latitude, N. or S. as the place is N. or S. of the equator.

The globe remaining in this position, the degree of the equator, which is under the brazen meridian, is the longitude of the place, which is E. or W.; as the place lies on the E. or W. side of the first meridian of the globe.—All the Atlantic ocean and America, are on the W. side of the meridian of London; and the greatest part of Europe, and of Africa, together with all Asia, are on the E. side of the meridian of London, which is reckoned the first meridian of the globe by the British geographers and astronomers.

PROB. II. The longitude and latitude of a place being given, to find that place on the globe.—Look for the given longitude in the equator (counting it eastward or westward from the first meridian, as it is mentioned to be E. or W.); and bringing the point of longitude in the equator to the brazen meridian, on that side which is above the south point of the horizon; then count from the equator, on the brazen meridian, to the degree of the given latitude, towards the N. or S. pole, according as the latitude is N. or S.; and under that degree of latitude on the meridian you will have the place required.

PROB. III. To find the difference of longitude, or difference of latitude, between any two given places.—Bring each of these places to the brazen meridian, and see what its latitude is: the lesser latitude subtracted from the greater, if both places are on the same side of the equator, or both latitudes added together if they are on different sides of it, is the difference of latitude required. And the number of degrees contained between these places, reckoned on the equator, when they are brought

brought separately under the brazen meridian, is their difference of longitude, if it be less than 180; but if more, let it be subtracted from 360, and the remainder is the difference of longitude required. Or,

Having brought one of the places to the brazen meridian, and set the hour index to XII, turn the globe until the other place comes to the brazen meridian; and the number of hours and parts of an hour, passed over by the index, will give the longitude in time; which may be easily reduced to degrees, by allowing 15 degrees for every hour, and one degree for every four minutes.

N. B. When we speak of bringing any place to the brazen meridian, it is the graduated side of the meridian that is meant.

PROB. IV. *Any place being given, to find all those places that have the same longitude or latitude with it.*—Bring the given place to the brazen meridian; then all those places which lie under that side of the meridian, from pole to pole, have the same longitude with the given place. Turn the globe round its axis: and all those places, which pass under the same degree of the meridian that the given place does, have the same latitude with that place.

Since all latitudes are reckoned from the equator, and all longitudes are reckoned from the first meridian, it is evident, that the point of the equator which is cut by the first meridian, has neither latitude nor longitude.—The greatest latitude is 90 degrees, because no place is more than 90 degrees from the equator: and the greatest longitude is 180 degrees, because no place is more than 180 degrees from the first meridian.

PROB. V. *To find the antæci, peræci, and antipodes of any given place*—Bring the given place to the brazen meridian; and having found its latitude, keep the globe in that situation, and count the same number of degrees of latitude from the equator towards the contrary pole; and where the reckoning ends, you have the *antæci* of the given place upon the globe. Those who live at the equator have no *antæci*.

The globe remaining in the same position, set the hour index to the upper XII on the horary circle, and turn the globe until the index comes to the lower XII; then the place which lies under the meridian, in the same latitude with the given place, is the *peræci* required. Those who live at the poles have no *peræci*.

As the globe now stands (with the index at the lower XII), the *antipodes* of the given place will be under the same point of the brazen meridian where its *antæci* stood before. Every place upon the globe has its *antipodes*.

PROB. VI. *To find the distance between any two places on the globe.*—Lay the graduated edge of the quadrant of altitude over both the places, and count the number of degrees intercepted between them on the quadrant; then multiply these degrees by 60, and the product will give the distance in geographical miles; but to find the distance in miles, multiply the degrees by 69½, and the product will be the number of miles required. Or, take the distance between any two places with a pair of compasses, and apply that extent to the equator; the number of degrees, intercepted be-

tween the points of the compasses, in degrees of a great circle: which extend either to geographical miles, miles, as above.

PROB. VII. *A place on the globe and its distance from any other place or places upon the globe, which is a distance from the given place.*—Bring the place to the brazen meridian, and draw of altitude to the meridian the place; then keeping the globe in turn the quadrant quite round up degree of the quadrant that touch the place will pass over all the other places equally distant with it from the given place, as if one foot of a pair were set in the given place, and the other end to the second place, which is known; for if the compasses be then the first place as a centre, the move over all those places which are at distance with the second from it.

PROB. VIII. *The hour of the day given, to find all those places where that time.*—Bring the given place to the brazen meridian, and set the index to that time done, turn the globe until the index comes to the upper XII, and then all the places under the brazen meridian have that time.

N. B. The upper XII always stands for noon, and when the bringing of any place to the meridian is mentioned, the side of the globe on which the degrees are reckoned for is meant, unless the contrary side be expressed.

PROB. IX. *The hour of the day given, to find what o'clock it is at any other place.*—Bring the given place to the brazen meridian, and set the index to that time; then turn the globe, until the place where the hour is required comes to the meridian; the index will point out the hour at that place.

PROB. X. *To find the sun's place, and his declination for any given day.*—Look on the horizon for the given day; against it you have the degree of the ecliptic where the sun is (or his place) on that day. Find the same degree of that sign on the ecliptic line upon the globe, and having brought it to the brazen meridian, observe what declination it stands over it; for that is the sun's declination reckoned from the equator.

PROB. XI. *The day of the month given, to find all those places of the earth, where the sun will pass vertically on that day.*—Bring the place in the ecliptic for the given day to the brazen meridian, and the point of the meridian is over it; then turn the globe round its axis, until the sun's place is over it; the globe round its axis, all those places which pass under that point of the meridian are required; for as their latitudes are in degrees and parts of a degree, to the hour, the sun must be directly over them at its respective noon.

PROB. XII. *A place being given, to find those two days of the year, when the sun shall be vertical to that place.*—Bring the place to the brazen meridian, and the point of the meridian is over it; then turn the globe round its axis, until the sun's place is over it; the globe round its axis, all those places which pass under that point of the meridian are required; for as their latitudes are in degrees and parts of a degree, to the hour, the sun must be directly over them at its respective noon.

then turn the globe round its axis, and bring the place to the upper part of the brazen meridian, as in the former problem: then, as the sun will be visible to all those parts of the globe which are above the horizon, the moon will be visible to all those parts which are below it, at the time of her greatest obscuration.

PROB. XVI. *To rectify the globe for the latitude, the zenith, and the sun's place.*—Find the latitude of the place (by Prob. I.), and if the place be in the northern hemisphere, raise the north pole above the north point of the horizon, as many degrees (counted from the pole upon the brazen meridian) as are equal to the latitude of the place. If the place be in the southern hemisphere, raise the south pole above the south point of the horizon as many degrees as are equal to the latitude. Then, turn the globe till the place comes under its latitude on the brazen meridian, and fasten the quadrant of altitude so, that the chamfered edge of its nut (which is even with the graduated edge) may be joined to the zenith, or point of latitude. This done, bring the sun's place in the ecliptic for the given day (found by Prob. X.) to the graduated side of the brazen meridian, and set the hour-index to XII at noon, which is the uppermost XII on the hour-circle; and the globe will be rectified.

PROB. XVII. *The latitude of any place, not exceeding $66\frac{1}{2}$ degrees, and the day of the month, being given; to find the time of the sun's rising and setting, and consequently the length of the day and night.*—Having rectified the globe for the latitude, and for the sun's place on the given day (as directed in the preceding problem), bring the sun's place in the ecliptic to the eastern side of the horizon, and the hour index will show the time of sun-rising; then turn the globe on its axis, until the sun's place comes to the western side of the horizon, and the index will show the time of sun-setting. The hour of sun-setting doubled, gives the length of the day; and the hour of sun-rising doubled, gives the length of the night.

PROB. XVIII. *The latitude of any place, and the day of the month, being given; to find when the morning twilight begins, and the evening twilight ends, at that place.*—This problem is often limited: for, when the sun does not go 18 degrees below the horizon, the twilight continues the whole night; and for several nights together in summer, between 49 and $66\frac{1}{2}$ degrees of latitude; and the nearer to $66\frac{1}{2}$, the greater is the number of these nights. But when it does begin and end, the following method will show the time for any given day. Rectify the globe, and bring the sun's place in the ecliptic to the eastern side of the horizon; then mark with chalk that point of the ecliptic which is in the western side of the horizon, it being the point opposite to the sun's place; this done, lay the quadrant of altitude over the said point, and turn the globe eastward, keeping the quadrant at the chalk mark, until it is just 18 degrees high on the quadrant; and the index will point out the time when the morning twilight begins: for the sun's place will then be 18 degrees below the eastern side of the horizon. To find the time when the evening twilight ends, bring the sun's place to the western side of the horizon,

and the point opposite to it, which was marked with the chalk, will be rising in the east; then bring the quadrant over that point, and keeping it thereon, turn the globe westward, until the said point be 18 degrees above the horizon on the quadrant, and the index will show the time when the evening twilight ends; the sun's place being then 18° below the western side of the horizon.

PROB. XIX. *To find on what day of the year the sun begins to shine constantly, on any given place on the north frigid zone; and how long he continues so to do.*—Rectify the globe to the latitude of the place, and turn it about until some point of the ecliptic, between Arctus and Cancer, coincides with the north point of the horizon where the brazen meridian cuts it; then find, on the wooden horizon, what day of the year the sun is in that point of the ecliptic; for that is the day on which the sun begins to shine constantly on the given place without setting. This done, turn the globe, until some point of the ecliptic, between Cancer and Libra, coincides with the north point of the horizon, where the brazen meridian cuts it; and find, on the wooden horizon, on what day the sun is in that point of the ecliptic; which is the day that the sun leaves off constantly shining on the said place, and rises and sets to it as to other places on the globe. The number of natural days, or complete revolutions of the sun about the earth, between the two days above found, is the time that the sun keeps constantly above the horizon without setting; for all that portion of the ecliptic, which lies between the two points which intersect the horizon in the very north, never sets below it; and there is just as much of the opposite part of the ecliptic that never rises; therefore the sun will keep as long constantly below the horizon in winter as above it in summer.

PROB. XX. *To find in what latitude the sun shines constantly, for any length of time less than 182½ of our days and nights.*—Find a point in the ecliptic half as many degrees from the beginning of Cancer (either toward Arctus or Libra) as there are natural days in the time given; and bring that point to the north side of the brazen meridian, on which the degrees are numbered from the pole towards the equator: then keep the globe from turning on its axis, and raise the meridian up or down, until the foresaid point of the ecliptic comes to the north point of the horizon, and then the elevation of the pole will be equal to the latitude required.

PROB. XXI. *The latitude of a place, not exceeding 66½ degrees, and the day of the month, being given; to find the sun's amplitude or point of the compass, on which he rises or sets.*—Rectify the globe, and bring the sun's place to the eastern side of the horizon; then observe what point of the compass on the horizon stands right against the sun's place, for that is his amplitude at rising. This done, turn the globe westward, until the sun's place comes to the western side of the horizon, and it will cut the point of his amplitude at setting. Or, you may count the rising amplitude in degrees, from the east point of the horizon to that point where the sun's place cuts it; and the setting amplitude from the west point of the horizon to the sun's place at setting.

PROB. XXII. *The latitude, the sun's place, his altitude, being given; to find the time of day, and the sun's azimuth, or number of that he is distant from the meridian.*—Rectify the globe, and bring the sun's place to the height upon the quadrant of altitude; on the eastern side of the horizon, if the time be in the noon; or the western side, if it be in the noon; then the index will show the hour, and the number of degrees in the horizon, intercepted between the quadrant of altitude and the point, will be the sun's true azimuth at that time.

PROB. XXIII. *The latitude, hour of the day, the sun's place, being given; to find the sun's altitude and azimuth.*—Rectify the globe, and turn the index points to the given hour; then the quadrant of altitude over the sun's place on the ecliptic, and the degree of the quadrant on the sun's place is his altitude at that time above the horizon; and the degree of the horizon on the quadrant is the sun's azimuth, reckoned from the meridian.

PROB. XXIV. *The latitude, the sun's place, and his azimuth, being given; to find out the ecliptic, the day of the month, and the time of day, though they had all been lost.*—Rectify the globe for the latitude and zenith, and set the quadrant of altitude to the given azimuth in the zone; keeping it there, turn the globe on its axis, until the ecliptic cuts the quadrant in the altitude: that point of the ecliptic which is on the quadrant there will be the sun's place; the day of the month answering thereto will be the day over the like place of the sun on the wooden horizon. Keep the quadrant of altitude in the same position; and, having brought the sun's place to the brazen meridian, and the hour index to noon, turn back the globe, until the sun cuts the quadrant of altitude again, and the index will show the hour.

Any two points of the ecliptic, which are distant from the beginning of Cancer or of Capricorn, will have the same altitude and azimuth at the same hour, though the months be different; and therefore it requires some care in the problem, not to mistake both the month and the day of the month; to avoid which, observe, that from the 21st of March to the 21st of June, the sun is between the beginning of Aries and beginning of Cancer; is to be used from the 21st of June to the 21st of September, between the beginning of Cancer and beginning of Libra; from the 21st of September to the 21st of December, between the beginning of Libra and beginning of Capricorn; and from the 21st of December to the 21st of March, between the beginning of Capricorn and beginning of Aries. As one can never be at a loss to know in what quarter of the year he takes the sun's altitude and azimuth, the above caution with regard to the quarters of the ecliptic will keep him right in the month and day thereof.

PROB. XXV. *To find the length of the day at any given place.*—If the place be on the side of the equator, find its latitude (by Prob. I.) and elevate the north pole to that latitude; bring the beginning of Cancer to the brazen meridian, and set the hour-index to XII at noon. But if the given place be on the S. side of

elevate the south pole to its latitude, and the beginning of Capricorn to the brazen meridian, and the hour-index to XII. This done, turn the globe westward, until the beginning of Capricorn (as the latitude is N. or S.) to the horizon; and the index will then show the time of sun-setting, for it will come over all the afternoon hours, between sun-rise and sun-set; which length of time being doubled, will give the whole length of the day from sun-rising to sun-setting. For, in all latitudes the sun rises as long before mid day as he sets after it.

XXVI. *To find in what latitude the length of any given length, less than 24 hours, is.* If the latitude be N. bring the beginning of Capricorn to the brazen meridian, and elevate the south pole to about $66\frac{1}{2}$ degrees; but if the latitude be S. bring the beginning of Capricorn to the brazen meridian, and elevate the south pole to about 66 degrees; because the longest day in N. latitude, when the sun is in the first point of Cancer, is equal to the shortest day in S. latitude, when he is in the first point of Capricorn. Then set the hour-index to noon, and turn the globe westward, until the hour-index points at half the number of hours given; which done, keep the globe from turning on its axis, and slide the meridian down in the ecliptic, until the aforesaid point of the ecliptic (Cancer or Capricorn) comes to the horizon; the elevation of the pole will be equal to the latitude required.

XXVII. *The latitude of any place, not above $66\frac{1}{2}$ degrees, being given; to find in what latitude the place is.*—Find the length of the day at the given place, (by Prob. XXV.) and divide it by twelve, double that number, and the result will give the climate in which the place is.

XXVIII. *The latitude, and the day of the year being given; to find the hour of the day, when the sun shines.*—Set the wooden horizon level, and the brazen meridian due N. and S. as a mariner's compass; then, having rectified the globe, stick a small sewing needle into the surface of the globe, perpendicular to that of the surface of the globe; this done, turn the globe on its axis, until the needle comes to the brazen meridian, and set the hour-index to noon; then turn the globe on its axis, until the needle points exactly towards the sun; it will do when it casts no shadow on the globe, and the index will show the hour.

XIV. DIRECTIONS for using the CELESTIAL GLOBE.

shall now proceed to the use of the celestial globe, premising, that as the equator, ecliptic, polar circles, horizon, and brazen meridian are exactly alike on both globes, all the problems concerning the sun are solved in the same way. The method also of rectifying the globe is the same. *N. B.* The sun's place for any day of the year stands directly over that day on the horizon of the celestial globe, as on the terrestrial.

LATITUDE and LONGITUDE of the stars, and all other celestial phenomena, are reckoned from that of places on the earth; for

all terrestrial latitudes are reckoned from the equator; and longitudes from the meridian of some remarkable place; but all astronomers reckon the latitudes of the heavenly bodies from the ecliptic; and their longitudes from the equinoctial colure, in that semicircle of it which cuts the ecliptic at the beginning of Aries; and thence eastward, quite round; so that stars between the equinoctial and the northern half of the ecliptic, have north declination and south latitude; those between the equinoctial and the southern half of the ecliptic have south declination and north latitude; and all between the tropics and poles, have declinations and latitudes of the same denomination.

There are six great circles on the celestial globe, which cut the ecliptic perpendicularly, and meet in two opposite points in the polar circles; which points are each ninety degrees from the ecliptic, and are called its poles. These polar points divide those circles into 12 semicircles; which cut the ecliptic at the beginning of the twelve signs. They resemble so many meridians on the terrestrial globe; and as all places which lie under any particular meridian semicircle on that globe have the same longitude; so all those points of the heaven, through which any of the above semicircles are drawn, have the same longitude.—And as the greatest latitudes on the earth are at the north and south poles of the earth, so the greatest latitudes in the heaven are at the north and south poles of the ecliptic.

For the division of the stars into constellations, &c. see ASTRONOMY.

PROB. I. *To find the right ascension and declination of the sun, or any fixed star.*—Bring the sun's place in the ecliptic to the brazen meridian: then that degree in the equinoctial which is cut by the meridian, is the sun's *right ascension*; and that degree of the meridian which is over the sun's place is his *declination*. Bring any fixed star to the meridian, and its right ascension will be cut by the meridian in the equinoctial; and the degree of the meridian that stands over it is its declination.

So that right ascension and declination, on the celestial globe, are found in the same manner as longitude and latitude on the terrestrial.

PROB. II. *To find the latitude and longitude of any star.*—If the given star be on the north side of the ecliptic, place the 90th degree of the quadrant of altitude on the north pole of the ecliptic, where the 12 semicircles meet, which divide the ecliptic into the 12 signs; but if the star be on the S. side of the ecliptic, place the 90th degree of the quadrant on the south pole of the ecliptic: keeping the 90th degree of the quadrant on the proper pole, turn the quadrant about, until its graduated edge cuts the star: then the number of degrees in the quadrant, between the ecliptic and the star, is its latitude; and the degree of the ecliptic cut by the quadrant, is the star's longitude, reckoned according to the sign in which the quadrant then is.

PROB. III. *To represent the face of the starry firmament, as seen from any given place of the earth, at any hour of the night.*—Rectify the celestial globe for the given latitude, the zenith, and sun's place in every respect, as taught by the XVth

on for the terrestrial; and turn it about, the index points to the given hour; then the hemisphere of the globe will represent the half of the heaven for that time; all the stars on the globe being then in such situations as correspond to those in the heaven. And if the globe be placed duly north and south, every star in the globe will point toward the like star in the heaven; by which means the constellations and remarkable stars may be easily known; all those stars under the upper part of the brazen meridian, between the south point of the horizon and the north pole, are at their greatest altitude, if the latitude of the place be N. but if the latitude be S. those stars which lie under the upper part of the meridian, between the north point of the horizon and the south pole, are at their greatest altitude.

PROB. IV. *The latitude of the place, and day of the month, being given; to find the time when any known star will rise, or be upon the meridian, or set.*—Having rectified the globe, turn it about until the given star comes to the eastern side of the horizon, and the index will show the time of the star's rising; then turn the globe westward, and when the star comes to the brazen meridian, the index will show the time of the star's coming to meridian of your place; lastly, turn on, until the star comes to the western side of the horizon, and the index will show the time of the star's setting. *N. B.* In northern latitudes, those stars which are less distant from the north pole than the quantity of its elevation above the north point of the horizon never set; and those which are less distant from the south pole than the number of degrees by which it is depressed below the horizon never rise; and *vice versa* in southern latitudes.

PROB. V. *To find at what time of the year a given star will be upon the meridian at a given hour of the night.*—Bring the given star to the upper semicircle of the brazen meridian, and set the index to the given hour; then turn the globe, until the index points to XII at noon, and the upper semicircle of the meridian will then cut the sun's place, answering to the day of the year sought; which day may be easily found against the like place of the sun among the signs on the wooden horizon.

PROB. VI. *The latitude, day of the month, and azimuth of any known star being given; to find the hour of the night.*—Having rectified the globe for the latitude, month, and sun's place, lay the quadrant of altitude to the given degree of azimuth in the horizon; then turn the globe on its axis, until the star comes to the graduated edge of the quadrant; and when it does, the index will point out the hour of the night.

PROB. VII. *The latitude of the place, the day of the month, and altitude of any known star, being given; to find the hour of the night.*—Rectify the globe as in the former problem; and at the hour of the night, and turn the globe until the index points at the supposed hour; then lay the graduated edge of the quadrant of altitude over the known star; and if the degree of the star's height in the quadrant upon the globe answers exactly to the degree of the star's observed altitude in the heaven, you have guessed exactly: but if the star

on the globe is higher or lower than it is supposed to be in the heaven, turn the globe or forwards, keeping the edge of the quadrant upon the star, until its centre comes to the supposed altitude in the quadrant; and then will show the true time of the night.

PROB. VIII. *An easy method for finding the hour of the night by any two known stars, knowing either their altitude or azimuth of passing both their altitude and azimuth, thereby the true meridian.*—Tie one end to a common musket bullet; and having the globe as above, hold the other thread in your hand, and carry it slowly between your eye and the starry heaven, find it cuts any two known stars at one guessing at the hour of the night, turn until the index points to that time in the circle; which done, lay the graduated edge of the quadrant over any one of these stars in the globe, which the thread cut in. If the said edge of the quadrant cuts the other star also, you have guessed the time exactly; if it does not, turn the globe slowly backward, until the quadrant (kept upon the first star) cuts them both through their centres; the index will point out the exact time of the degree of the horizon cut by the thread, will be the true azimuth of both these stars; and the stars themselves will show their true altitudes in the quadrant. At present, if a common azimuth compass upon a floor or level pavement, that the heaven may have the same bearing upon it, for the variation of the true altitude has in the wall, and a thread extends over the top of the compass will cut the meridian; and if a line be drawn upon the floor or pavement, along the compass, the line an upright wire be placed at the end of the line, the shadow of the wire will cut that line, when the sun is on the meridian upon the pavement.

PROB. IX. *To find the place of the sun at any planet; and thereby find the time of its rising, and setting.*—Seek in an Ephemeris the geocentric place of a planet in the ecliptic, for the given month; and according to its longitude, and latitude, as shown by the ephemeris, mark with chalk upon the globe. Then, tilted the globe, turn it round its axis, and as the said mark comes to the edge of the horizon, to the brazen meridian, western side of the horizon, the index will point out the time the planet rises, comes to meridian, and sets, in the same manner do for a fixed star.

For an explanation of the foregoing globe, and the equation of time, see *ALGEBRA, INDEX.*

SECT. XV. DESCRIPTION OF THE IMPROVEMENTS APPLIED TO GLOBES.

GLOBES mounted in the common manner with their hour circles fixed on the axis, though instructive instruments for ex-

es of geography and the spherical astronomy, yet have several defects; prevent any elevation of the north and near to their axes, or the brass meridian quite moveable round in the horizon do not show how all the phenomena by them arise from the motion of the latter of consequence to beginners: and is adapted to the present age; consequently serve accurately the purposes of astronomy and history, which they might be, if the poles whereon they turn were to move in a circle round those of the horizon according to its present obliquity.

Mr John Senex, F. R. S. invented a method for remedying these defects, by fixing the axis of the diurnal motion to two shoulders of brass, at the distance of $23\frac{1}{2}$ degrees of the ecliptic. These shoulders are fastened at the other end to an iron rod, which passes through the poles of the ecliptic, and is made to move round with a very stiff spring.

That when it is adjusted to any point of the ecliptic which the equator is made to intersect, the diurnal motion of the globe on its axis is turned. When it is to be adjusted for the past or future, one of the brazen circles is brought under the meridian, and held with one hand, whilst the globe is turned with the other, so that the point of the ecliptic which the equator is to intersect, may pass under the degree of the brazen meridian; then turned to that point, and turning the globe, it will describe the equator according to the position at the time required; and transferred to $23\frac{1}{2}$ and $66\frac{1}{2}$ degrees on the ecliptic, the tropics and polar circles will be traced for the same time. By this contrivance the celestial globe may be so adjusted, as to represent not only the rising and setting of the sun and planets in all latitudes, but likewise all the phenomena that depend upon the motion of the diurnal axis round the annual axis.

These globes, especially the two great ones, which are 28 inches in diameter, have been made upon this principle; so that by means of a screw, the pole of the equator is made to revolve about the pole of the ecliptic. *Phil. Trans.* N^o 447. p. 201, 203. or *Martyn's Abr.* Vol. VIII. p. 217. and N^o 493. art. 18. in *ibid.* Vol. XLVI. p. 290.

To represent the above phenomena in the most easy manner, the late Mr B. Martin invented Mr Senex's contrivance a moveable ecliptic and solstitial colure, a moveable equator, and a moveable ecliptic; all so contrived as to represent those imaginary lines of the heavens for any age of the world.

Mr Harris, late essay-master of the mint, to remedy the former of the defects mentioned, by placing two horary circles on the meridian, one at each pole; these circles are fixed tight between two brass rollers placed on the axis, so that when the globe is turned, they revolve round with it, the meridian serving as an index to cut the horary divisions. The globe in this state serves universally and readily to solve all the problems in N. and S. latitudes, and

also in places near the equator; whereas in the common construction, the axis and horary circle prevent the brass meridian from being moveable quite round in the horizon. This globe is also adapted for showing how the vicissitudes of day and night, and the alteration of their lengths, are really occasioned by the motion of the earth: for this purpose, he divided the brass meridian at one of the poles into months and days, according to the sun's declination, reckoning from the pole. Therefore, by bringing the day of the month to the horizon, and rectifying the globe according to the time of the day, the horizon will represent the circle separating light and darkness; and the upper half of the globe, the illuminated hemisphere, the sun being in the zenith. *Phil. Trans.* N^o 456. p. 321. or *Martyn's Abr.* Vol. VIII. p. 352.

The late Mr George Adam, mathematical instrument-maker, made some additional improvements in the construction of the globes. His globes, like others, are suspended at their poles in a strong brass circle NZÆS (See *Plate CLXIII*, fig. 3, representing the celestial,) and turn therein upon two iron pins, which form the axis. They have each a thin brass semicircle NUIS moveable about these poles, with a small, thin, sliding circle II thereon; which semicircle is divided into two quadrants of 90 degrees each, from the equator to both the poles. On the terrestrial globe this semicircle is a moveable meridian, and its small sliding circle, which is divided into a few points of the compass, is the visible horizon of any particular place to which it is set. On the celestial globe this semicircle is a moveable circle of declination, and its small annexed circle an artificial sun or planet. Each globe has a brass wire TWY placed at the limits of the crepusculum or twilight; which, together with the globe, is mounted in a wooden frame, supported by a neat pillar and claw feet, with a magnetic needle in a compass-box, marked M in the figure. On the strong brass circle of the terrestrial globe, and about $23\frac{1}{2}$ degrees on each side of the north pole, the days of each month are laid down according to the sun's declination; and this brass circle is so contrived, that the globe may be placed with the north and south poles in the plane of the horizon, and with the south pole elevated above it. The equator on the surface of either globe serves the purpose of the horary circle, by means of a semicircular wire placed in the plane of the equator, ÆF, carrying two indices, F; one on the east, the other on the west side of the strong brass circle; one of which is occasionally to be used to point out the time upon the equator. In these globes, therefore, the indices being set to the particular time on the equator, the globes are turned round, and the indices point out the time by remaining fixed; whereas in the globes as generally mounted, the indices move over the horary circles while the globe is moving, and thus point out the change of time. For farther particulars of these globes, and the method of using them, *Mr Adam's Treatise on their Construction and Use*, &c. 1772, may be consulted.

The additions and alterations above mentioned, made by Mr Adam, may save trouble to a practitioner.

moner in the performance of a few complex problems, and render the globes more elegant and costly; but to a young beginner, the more simple the construction of the globes, the better will they be adapted to initiate him into the *rationale* and practice of the problems in general; and as such, the globes, as improved by the late Mr B. Martin and Mr Wright, described below, appear to have considerably the advantage in simplicity, and to obviate several material defects that attend the construction of the other globes. The chief of the defects in the old globes is, that the horary circle being screwed on the meridian at the north pole, prevents the elevation of the south pole; which is necessary for the performance of problems for all latitudes. In Mr Adam's, the semicircular wire *AEF* preventing the equator being placed exactly in the horizon, or the poles in the zenith, the great distance of the strong brass circle *NZÆS* from the surface of the globe, on account of the brass semicircles, renders the solution of problems, which require the use of the strong circle, not very easy nor accurate.

An easy and expeditious method of elevating the south pole of the terrestrial globe, and by which means the new discoveries, tracks, &c. made of late years by Captain Cook and other eminent navigators in the south seas, may be clearly seen and traced by the eye over all the southern ocean, was made use of by Mr B. Martin in the construction of the following improvement.

There is a groove turned out on the back part of the brass meridian *A*, *fig. 1. Plate CLXIII*; and by unscrewing the nut of the hour circle *D* at the north pole, the circle is made to slide away to any other part of the meridian, as at *G*. The meridian is fixed or moveable at pleasure by a screw passing into the groove, through the piece or side of the notch in which it moves, on the bottom or nadir point: by properly loosening this screw, the meridian is free to move, and the globe with it, into any required position; but at the same time, it is confined within the notch of the brass piece, and thereby the globe is prevented from falling out of the frame in any position thereof whatsoever. The hour-circle being removed, both the north and south poles of the globe may be placed in the horizon, and thereby form a right sphere, which the usual mounting of the globes does not admit of.

By this construction also, the south pole may be elevated for all latitudes: for this purpose there is an hour-circle about the south pole between the meridian and the globe, which does not obstruct the sight of any land, none having been thereabouts discovered. Consequently the globe is thus equally useful for the solution of all common geographical problems in the southern as in the northern hemisphere, and more extensively so than heretofore.

In this method of mounting the globe, it may readily be converted into a *TELLURIAN*; for as the globe cannot fall out of the frame, the horizon of it may be placed in a perpendicular position: then the sun's place in the ecliptic being brought to the meridian, and its declination, the pole of the globe must be elevated to *eclination*; which may be done by means

of the degrees cut on the outer edge of the meridian for that purpose. If a lighted candle be placed at a considerable distance, the height of the centre of the globe, and with the meridian, the globe will exhibit the phenomena of our earth for that day; and the horizon of the globe become the horizon, and divides the whole into light and dark hemispheres: therefore, turning the globe about its axis from *W*, it clearly appears that all places emerging from the dark hemisphere into the luminous hemisphere, the western part of the horizon, will then be rising; when they arrive at the meridian, it will be their noon; and when they come to the dark hemisphere at the eastern horizon, they will see the sun as setting.

When any place is under the meridian, the hour index to *XII*, and revolve the globe, it will the natural motion and position of the sun be seen when at all hours of the day the sun rises or sets to it; the length of the day and nocturnal arches, or of day and night, what places the sun does not rise and time; and whence the vicissitudes of day and night throughout the year in all latitudes, &c. give this experiment the best effect, should be enclosed within a dark lac, its light issue through a hole or lens in the purpose.

On the outer part of the sliding hour-circle about the north pole, are usually engraved the degrees of the compass; so that by bringing the hour-circle centrally over any place on the globe, the place may be seen by inspection only upon what compass any other place bears from it, all over the globe.

This method of the sliding hour-circle is applicable to the celestial globe. Mr Martin of London has yet farther simplified the construction of the hour circles, and it is the less operose than Mr Martin's above. It consists of the following particulars: The hour circles are engraved on the globes two hour-circles at each of the poles; which are double set of 12 hours, as usual in the brass ones, except that the hours are round both to the right and left: See *CLXIII*. The hour hand or index, is in such a manner under the brass meridian, that it may be moveable at pleasure to any required position, and yet remain there during the revolution of the globe on its axis, entirely independent of the poles of the globe, in this manner by the motion of the globe on its axis, carrying the hour-circle, the hour-circle serves to point out the time, the same in the reverse way by Mr Martin's or other method.

There is an advantage by having the hour-circle figured both ways, as one hour serves for the other, as one hour serves for the other, and the rising and setting, and *vice versa*, may be seen at the same time on the hour circle. The problems generally to be performed, on the globe, the circle of reckoning, at one only the complement. *Fig. 5.* is a representation of the globe, with Mr Wright's hour-circle at *C*.

Revised

William Jones, mathematical instrument maker, who mounts globes according to the improvements above mentioned of Messrs Wright, applies a compass of a portable part of the wooden horizon to both globes (see F, fig. 1.), by a dove-tail in the lid of the compass-box; which method is more convenient and ready in the use of problems, than when fixed under a frame at their feet; and as it occasions less room away from the globes, the compass is useful in other situations.

To perform the problems which relate to the altitudes and azimuths of celestial objects, Mr. F. R. S. has made the following instruments applicable to the celestial globe. In the first, a thin flexible slip of brass, which generally accompanies the globes, called the *quadrant*, Mr. Smeaton substitutes an arch of the same radius, breadth and substance, as the meridian, divided into degrees, &c. as the divisions of that circle, and which, by reason of its strength, is not liable to be bent out of the plane of a vertical circle, as is usual with the quadrant put to globes. That end of the arch, at which the divisions begin, is made square, being filed off square to fit and lay on it throughout its whole breadth; the upper end of the arch is firmly attached, by means of an arm, to a vertical socket, in such a manner that when the lower end of the arch is in the plane of the horizon, the lower end of this socket is in the plane of the upper edge of the brass meridian, directed to the zenith of the globe. This socket is fixed in the ground with a steel spindle of the same diameter, so that it will turn freely on it without friction; and the steel spindle has an apparatus attached to its lower end, by which it can be kept in a vertical position to the brass meridian, so that its centre directly over the zenith point may be. The spindle being fixed firmly in the ground, and the socket which is attached to the arch put on to it, and so adjusted that the lower end of the arch just rests on and fits the plane of the horizon; it is evident that the altitude of any object above the horizon will be the degree which it intersects on this arch, and its azimuth by that end of the arch which is on the horizon.

Mr. Smeaton also directs to place the index usually fixed on one end of the axis to the hour, in such a manner that its upper end may move in the plane of the hour circle, rather than above it, as it usually does. He directs to fix the end of this index to a circular arch, of the same radius with the inner edge of the hour circle, which it is to fit very exactly; and a line is drawn on its upper surface to determine the hour, instead of the tapering point which is usually used. By these means half minutes are distinguished, if the hour circle be 4 inches in diameter. Mr. Smeaton also describes a method for preventing the meridian from shifting, by being rectified for the latitude of the place, while the operator is engaged in adjusting the other parts of the apparatus. But as the method which this is intended to answer appears to be better performed, by the turned groove

on the meridian in Mr. Martin's contrivance described above, we shall omit the particular description; and for farther explanations and figures of Mr. Smeaton's improvements, refer the reader to the *Phil. Trans.* Vol. LXXIX, Part i.

Mr. FERGUSON made another improvement on the celestial globe. See *ASTRONOMY, Index*.

Most of the above problems may also be performed by accurate maps; but this requires a great deal of calculation, which is often very troublesome. The *ANALEMMA*, or Orthographic Projection, delineated on *Plate CLXIV*. will solve many of the most curious; and with the assistance of the maps will be almost equivalent to a terrestrial globe. The parallel lines drawn on this figure represent the degrees of the sun's declination from the equator, whether N. or S. amounting to $23\frac{1}{2}$ nearly. On these lines are marked the months and days which correspond to such and such declinations. The size of the figure does not admit of having every day of the year inserted; but by making allowance for the intermediate days, in proportion to the rest, the declination may be guessed at with tolerable exactness. The elliptical lines are designed to show the hours of sun-rising or sun-setting, before or after six o'clock. As 60 minutes make an hour of time, a fourth part of the space between each of the hour lines will represent 15 minutes; which the eye can readily guess at, and which is as great exactness as can be expected from any mechanical invention, or as is necessary to answer any common purpose. The circles drawn round the centre at the distance of $11\frac{1}{4}$ each, show the point of the compass on which the sun rises and sets, and on what point the twilight begins and ends. To make use of this analemma, it is only necessary to consider, that, when the latitude of the place and the sun's declination are both north or both south, the sun rises before six o'clock, between the east and the elevated pole; that is, towards the north, if the latitude and declination are north; or towards the south, if the latitude and declination are south. Let us now suppose it is required to find the time of the sun's rising and setting, the length of the days and nights, the time when the twilight begins and ends, and what point of the horizon the sun rises and sets on, for the Lizard point in England, Franckfort in Germany, or Abbeville in France, on the 30th of April. The latitude of these places by the maps will be found nearly 50° north. Place the moveable index so that its point may touch 50° on the quadrant of north latitude in the figure; then observe where its edge cuts the parallel line on which April 30th is wrote. From this reckon the hour-lines towards the centre, and you will find that the parallel line is cut by the index nearly at the distance of one hour and 15 minutes. So the sun rises at one hour 15 minutes before six, or 45 minutes after four in the morning, and sets 15 minutes after seven in the evening. The length of the day is 14 hours 30 minutes. Observe how far the intersections of the edge of the index with the parallel of April 30th is distant from any of the concentric circles; which you will find to be a little beyond that marked two points of the compass; and this shows, that on the 30th of April the sun rises two points and

GEOLOGICAL, *adj.* belonging to **GEOL**OGY.

(1.) * **GEOLOGY**. *n. f.* [*γῆ* and *λόγος*.] The
doctrine of the earth; the knowledge of the state
and nature of the earth.

(2.) **GEOLOGY**, [from *γῆ*, earth, and *λόγος*, dis-
course,] properly signifies a discourse upon the
earth; but is generally used for a discourse on the
origin or theory of the earth. See **TERRAQUE-**
OUS GLOBE. M. Chaptal, in his *Elem. of Chem.*
vol. 2. introduces his III. Part, "concerning Me-
tallie Substances," with "General Views respec-
ting the decompositions and changes to which the
stony part of our Globe has been subjected," un-
der the title of "GEOLOGICAL OBSERVATIONS."
From these we shall here give a short extract:
"The slightest observation (says he) shews us,
that living beings are kept up and perpetuated
only by successive decompositions and combina-
tions. A slight view of the mineral kingdom ex-
hibits the same changes; and our globe, in all its
productions, presents continual modifications, and
a circle of *activity*, which might appear incom-
patible with the apparent *inertia* of lithologic pro-
ducts. In order to arrange our ideas with greater
regularity, we will consider this globe in two dif-
ferent states. We will first examine the primitive
rock which forms the central part. This appears
to contain no germ of life, includes no remains or
part of any living being, and from every circum-
stance appears to have been of primitive forma-
tion, anterior to the creation of animated or ve-
getating bodies. We shall pursue the various
changes, which are daily produced by the de-
structive action of such agents as alter or modify
this substance. We shall then proceed to examine
what stones have been successively placed upon
this, and what are the decompositions to which
these secondary rocks have been subjected. The
observations of naturalists all unite to prove, that
the central part of the globe consists of the stone
known by the name of **GRANITE**. The profound
excavations, which the art of man or currents of
water, have made in the surface of our planet,
have all uncovered this rock, and have been in-
capable of penetrating lower. We may therefore
consider this substance as the nucleus of the globe;
upon this substance it is that all matters of
formation rest. Granite exhibits many
in its form, composition, and disposition;
its general consists of an assemblage of cer-

tain siliceous stones; such as quartz, fl-
spar, mica, &c. and the more or less ex-
magnitude of these elements of granite,
it to be divided into coarse-grained g-
fine grained granite. It appears to me
rocks owe their arrangement to water;
may be permitted to recur to that
which, according to sacred and profane
the water and earth were confounded
confused mixture of all principles form-
we shall see that the laws of gravity in
matter must have carried it down, and
produced the arrangement which ob-
present exhibits to us. The water, a
heavy, must have purified itself, and an
surface by a filtration through the other
while the earthy principles must have pr-
and formed a mud, in which all the g-
stones were confounded. In this very
der of things, the general law of affinity
continually tends to bring together all
parts, must have exerted itself upon the
of this almost fluid paste; and the result
been a number of bodies of a more del-
in crystals more or less regular; and
muddy substance, in which the princ-
stones were confounded, that compose
a rock must have been produced, con-
elementary stones all in their distinct
characters. In this manner we obser-
very different kinds develop themselves
which hold them in solution, and crys-
and gypsum formed in cays which co-
component parts. It may easily be
that the laws of gravitation must have
the arrangement and disposition of the

The rocks of granite being once estab-

our globe, we may, from the analysis of the various principles, and by attending to the various agents capable of altering the degradations to which it has been subjected. Water is the principal agent which we shall examine. This fluid, in the ocean, is carried by the winds to the most elevated mountains, where it is ated in rain, and forms torrents, which with various degrees of rapidity into the reservoir. This uninterrupted motion must gradually attenuate and wear away the rock, and carry their pulverulent substances more or less considerable. The air, and the varying temperatures of these rocks. Heat dries their surface, renders it more accessible and more penetrable, which succeeds; cold divides them, by the water which has entered into their texture itself affords the carbonic acid, which is limestone, and causes it to effloresce; the nites to the iron and calcines it; inasmuch as the concurrence of causes favours the dissolution; and consequently the action which clears the surface, carries away the acts of decomposition, and makes prior a succeeding process of the same nature. The first effect of the rain is therefore to be mountains. But the stones which them must resist in proportion to their and we observe peaks, which have destructive action of time, and still remain the primitive level of the mountains which appeared. The primitive rocks, alike in the injury of ages, as to the mountains which cover less elevated mountains with stones, may be considered as the origin of streams. The water, which falls on mountains, flows down in torrents by their faces. In its course, it wears away the which it incessantly acts. It hollows, of a depth proportioned to the rapidity of the rock over which it flows: at the same time that it carries along with it fragments of stones as it loosens in its course. led along by the water, strike together, and off their projecting angles; a process which quickly have afforded those rounded stones which form the pebbles of rivers. These are diminished in size in proportion to their distance from the mountain which affords them; so this cause that Mr Dorthes has referred to the proportionate magnitude of the pebbles, to our ancient worn stones, when compared with those of modern date: For the sea itself formerly much more inland, in the time of the Rhone, the stones which it received from the rivers, and threw back again upon it, had not run through so long a space as those which they at present pass us the remains of the Alps, carried along the Rhone, have successively covered the all comprised between the mountains of the Vivarais; and are carried into our deposit them in small pebbles on the pulverulent remains of mountains, (or

17 L

the powder which results from the rounding of these flints,) are carried along with greater facility than the flints themselves: They float long in the water whose transparency they impair; and when these waters are less agitated, they are deposited in a fine and light paste, forming beds more or less thick, and of the same nature as that of the rocks to which they owe their origin. These strata gradually became drier, by the agglutination of their principles; they become consistent, acquire hardness, and form siliceous clay, flex, petrosilex, and all the numerous class of pebbles, which are found dispersed in strata, or in banks, in the ancient beds of rivers. Mr Pallas has observed the transition of clay to the state of flex, in the brook of Sunghir near Wolodimir. Mr J. W. Baumer has likewise observed it in Upper Hesse. The mud is much more frequently deposited in the interstices between the rounded flints themselves, which it fills, and there forms a true cement that becomes hard, and constitutes the compound stones known by the names of Pudding-stones, and Gait-stones: for these two kinds do not appear to differ, but in the coarseness of the grain which forms them, and the cement which connects them. We sometimes observe the granite spontaneously decomposed. The texture of the stones which form it has been destroyed; the component parts are dissolved, and gradually carried away by the waters. I have observed near Mende, towards Castelnouvel, the most beautiful kaolin on the surface of a granite, in a state of decomposition; and this same rock is decomposed in several other parts of our province. It appeared that the felspar was particularly subject to be altered first. Most siliceous stones, formed by the decomposition of fluviatile waters, and hardened by the lapse of time are easily subjected to a second decomposition. Iron is the principal agent in these secondary alterations; and its calcination, determined by air or water, produces a disunion of principles. Nature may be observed in this process by an attentive examination of such alterations as gun flints, variolites, porphyries, jaspers, and the like are subjected to. The decomposition of flints, calcedonies, agates, and generally all stones of this kind, which possess a certain degree of transparency, appears to me to be referable to the volatilization of the water, which forms one of their principles, and is the cause of their transparency. These stones may be considered as commencements of crystallization; and when the water is dissipated, they effloresce after the manner of certain neutral salts. Hence it arises, that the decomposition is announced by opacity, a white colour, loss of consistence and hardness; and terminates by forming a very attenuated powder, sometimes of extreme whiteness. It is this decomposition particularly, which forms clays. There are flints, whose alterations form effervescent marles. These do not appear to be of the nature of primitive rocks: They have the same origin as the calcareous stones, from which they differ only in consequence of a very considerable proportion of clay. The stones which we so abundantly find around us, among calcareous decompositions, may be considered as of this kind. Water, filtering through mountains of primitive

X 4

rock.

rock, frequently carries along with it very minutely divided particles of quartz, and proceeds to form, by deposition, flint, opales, rock crystal, &c. These quartzose silicities, differently coloured, are of a formation considerably analogous to that of calcareous alabaster; and we perceive no other difference between them, than that of their constituent parts." M. Chaptal next proceeds to consider the decompositions and changes which appear to be produced by the elds of living or organized beings on our globe; such as "the remains of shell animals, of marine and terrestrial vegetables;" &c. for which, as room permits us not to quote the whole of his Geological Observations, we must refer the reader to his work.

* **GEOMANCER.** *n. f.* [*γην* and *μαντις*] A fortuneteller; a caster of figures; a cheat who pretends to foretell futurity by other means than the astrologer.—Fortunetellers, jugglers, *geomancers*, and the incantatory impostors, though commonly men of inferior rank, daily delude the vulgar. *Brown's Vulgar Errors.*

DEFINITIONS of the SCIENCE.

METRY is defined by Dr Johnson as follows:

METRY. *n. f.* [*γῆπιμα*; *geometrie*, Fr.] signifies the art of measuring the earth, distances or dimensions on or within it: now used for the science of quantity, extension or magnitude, abstractedly considered, in any regard to matter.—*Geometry* is usual-ly divided into speculative and practical; the former contemplates and treats of the pro-portion continued quantity abstractedly; and the latter applies these speculations and theo-ry to use and practice. *Harris*.—In the mus-ic there seems to be more *geometry* than in artificial engines in the world. *Ray*.—It is also for my censor I disdain,
thinks all science, as all virtue, vain;
counts *geometry* and numbers toys,
with his foot the sacred dust destroys.

Dryden's Pers.

The word **GEOMETRY** literally signifies *measuring the earth*, as it was the necessity of measur-land that first gave occasion to study the laws and rules of this science, which has since extended to numberless other speculations. It is the science of inquiring, inventing, demonstrating, all the affections of magnitude: it styles it the knowledge of magnitudes and their limitations; as also of their ratios, positions and motions of every kind. The word, *geometry*, together with *arithme-tics* forms the chief foundation of all the mathe-matics.

HISTORY of GEOMETRY.

The invention of geometry is generally ascribed to the EGYPTIANS. Herodotus, Diodorus, Strabo, Proclus, all agree that the annual inun-dation of the Nile gave rise to it, by carrying a-way the marks and boundaries of estates and covering the surface of the ground with mud, which effaced every trace of their for-mer divisions. Hence the Egyptians were obliged to distinguish and lay out their lands in consideration of their figure and quantity, so that every person might have his own property: and by repeated experience and practice, in measuring figures, lines, and schemes for this pur-pose, they gradually formed an art which, from its use in measuring of lands, the Greeks at-tributed to *Γῆπιμα*, *Geometry*. By farther con-sideration on the draughts of figures, their won-derful properties were more and more discovered, and continually gained ground and improved, till the discoveries of succeeding mathematicians. It appears to be the most probable origin of the science; though Josephus seems to ascribe the invention to the Hebrews; while others of the an-cient writers make Mercury the inventor. *Polyd. Virg.* *ecr.* l. i. c. 18.

It is said to have introduced this science into Greece; where it was greatly improved by himself, as well as by THALES, ANAXAGORAS of Clazomene, HIP-PARCHUS of Chios, and PLATO; who testified

his conviction of the necessity and importance of Geometry to the successful study of Philosophy, by inscribing over the door of his Academy, *Let no one ignorant of GEOMETRY enter here*. Plato thought the word *Geometry* too mean a name for this science; and substituted instead of it the more extensive name of **MENSURATION**; and after him others gave it the title of **PANTOMETRY**. But even these are now become too confined in their import, fully to comprehend its extent; for it not only inquires into, and demonstrates the quantities of magnitudes, but also their qualities, as the species, figures, ratios, positions, transformations, descriptions, divisions, the finding of their centres, diameters, tangents, asymptotes, curvatures, &c.

About 50 years after PLATO, EUCLID collected together all those theorems, which had been in-vented by his predecessors in Egypt and Greece, and digested them into 15 books, entitled *The Elements of Geometry*: demonstrating and arranging the whole in a very accurate and perfect manner.

The next to Euclid, of those ancient authors whose works are extant, is APOLLONIUS PER-GAËUS, who flourished in the reign of Ptolemy Eu-ergetes, about A. A. C. 230, and 100 years after Euclid. He was author of the first and principal work on Conic Sections; on account of which, and his other accurate and ingenious geometrical works, he acquired from his patron the emphati-cal appellation of the *Great Geometrician*.

Contemporary with Apollonius, or perhaps a few years before him, flourished ARCHIMEDES, celebrated for his extraordinary mechanical inven-tions during the siege of Syracuse, and no less so for his many ingenious geometrical compositions.

EUDOXUS of Cnidus, Archytas of Tarentum, Philolaus, Eratosthenes, Aristarchus of Samos, Dinostratus, the inventor of the quadratrix, Me-nechmus his brother, and the disciple of Plato, the two Aristæuses, Conon, Thracidius, Nicote-les, Leon, Theudius, Hermotimus, Hero, and Nicomedes, the inventor of the conchoid; besides many other ancient geometers, have contribu-ted to the improvement of geometry.

The Greeks continued their attention to it, even after they were subdued by the Romans; where-as the Romans themselves were so little acquaint-ed with it, even in the most flourishing time of their republic, that Tacitus informs us they gave the name of mathematicians to those who pursued the chimeras of divination and judicial astrology. Nor does it appear they were disposed to cultivate geometry during the decline, and after the fall of the Roman empire. But the case was different with the Greeks; among whom are found many excellent geometers since the commencement of the Christian era, and after the translation of the Roman empire. Ptolemy lived under Marcus Aurelius; and we have still extant the works of Pappus of Alexandria, who lived in the time of Theodosius; the commentary of Eutocius, the Ascalonite, who lived about A. D. 540, on Archi-medes's mensuration of the circle; and the com-mentary on Euclid, by Proclus, who lived under the empire of Anastasius.

The consequent inundation of ignorance and barbarism was unfavourable to geometry, as well

as to the other sciences; and the few who applied themselves to this science, were calumniated as magicians. However, in those times of European darkness, the Arabians were distinguished as the guardians and promoters of science; and from the 9th to the 14th century, they produced many astronomers, geometricians, geographers, &c.; from whom the mathematical sciences were again received into Spain, Italy, and the rest of Europe, somewhat before the year 1400.

Some of the earliest writers after this period, are Leonardus Pisanus, Lucas Pacioli or De Burgo, and others between 1400 and 1500. And after this appeared many editions of Euclid, or commentaries upon him: thus, Orontius Finæus, in 1570, published a commentary on the first 6 books; as did James Peletarius, in 1556; and about the same time Nicholas Tartaglia published a commentary on the whole 15 books. There have been also the editions, or commentaries, of Commandine, Clavius, Billingsly, Scheubelius, Herlinus, Dastypodius, Ramus, Herigon, Stevinus, Saville, Barrow, Taquet, Dechales, Fournier, Scarborough, Keill, Stone, and many others; but the completest edition of all the works of Euclid, is that of Dr Gregory, printed at Oxford in 1703, in Greek and Latin. The edition of Euclid, by Dr Robert Simson of Glasgow, containing the first 6 books, with the 11th and 12th, is much esteemed for its correctness.

The principal other elementary writers, besides the editors of Euclid, are Pardies, Marchetti, Wolfius, Simpf n, &c. And among those who have gone beyond Euclid in the nature of the elementary parts of geometry, may be chiefly reckoned, Apollonius, in his Conics, his Loci Plani, De Sectione Determinata, his Tangencies, Inclinations, Section of a Ratio, Section of a Space, &c.; Archimedes, in his treatises of the Sphere and Cylinder, the Dimension of the circle, of Conoids and Spheroids, or Spirals, and the quadrature of the Parabola; Theodosius, in his Spherics; Serenus, in his Sections of the Cone and Cylinder; Kepler's Nova Stereometria; Cavalieri's Geometria Indivisibilium; Torricelli's Opera Geometrica; Viviani in his Divisiones Geometricæ, Exercitatio Mathematica, De Locis Solidis, De Maximis & Minimis, &c.; Vietæ, in his Efectio Geometrica, Supplement. Geometricæ, Sectiones Angulares, Responsum ad Problemata; Apollonius Gallus, &c.; Gregory St Vincent's Quadratura Circuli; Fermat's Varia Opera Mathematica; Dr Barrow's Lectiones Geometricæ; Bulliald de Lineis Spiralibus; Cavalieri; Schooten and Gregory's Exercitationes Geometricæ, and Gregory's Pars Universalis, &c.; De Billy's treatise De Proportionibus Harmonicis; La Lovera's Geometria veterum promota; Similius's Meolabium, Problemata Solida, &c.; Wallis in his treatises De Cycloide, Cylindro, &c.; De Proportionibus, De Sectionibus Conicis, Arithmetica Infinitorum, De Centro Gravitatis, De Sectionibus Angularibus, De Angulo Contracto, Cono Cuneis, &c. &c.; Huygens De Omnicurva, in his Analysis Geometrica; Palaton on the Cycloid; Steph. Angeli's Problemata Geometrica; Alex. Anderson's Suppl. Reivertii, V. omnium Proportionalitatem, &c.; Baroni's Geomet. Proble. &c.; Gherardo Grandini Geometr. Demonstr. &c.; Gher-

taldi Apollonius Redivivus, &c.; La Coten or a Ceulen, de Circulo et Adjectis; Snell's Apollonius Batavus, Cyclometria; Herberstein's Diotomo Circulorum; Palcat. in Geometriam; Guidini Centro Baf several others equally eminent, of moderate date, as Dr Rob. Simson, Dr Mat. St Tho. Simpson, &c.

Since the introduction of the new geometry of curve lines; as exponential equations, in this part of geometry following names, among many others especially to be respected, viz. D Schooten, Newton, Maclaurin, Br Cramer, Cotes, Waring, &c. &c.

As to the subject of practical geometry chief writers are Beyer, Kepler, Ram Mallet, Tacquet, Ozanam, Wolfius, with innumerable others.

On the whole, the history of geometry divided into 4 grand æras: viz. 1. From its introduction into Greece by EUCLID: 2. From that period to its meridian by EUCLID: 3. From EUCLID and ARCHIMEDES, who, by applying algebraic elements of geometry, gave a new turn to it: and, 4. From Descartes to its present state, by Sir ISAAC NEWTON and M. LEIBNITZ, introduced still greater improvements by the application of FLUXIONS.

This science is generally divided into viz. 1. THEORETICAL GEOMETRY, the general principles of the science; 2. PRACTICAL GEOMETRY, or the application of these principles to the mensuration of solids, &c.

PART I.

THEORETICAL GEOMETRY

OR, GENERAL PRINCIPLES OF THE SCIENCE.
SECT. I. OF STRAIGHT LINES and ANGLES. See *Plates* CLXV, CLXVI.

DEFINITIONS.

1. A POINT is that which has position without magnitude.
2. A LINE is length without breadth; the extremities of a line are there.
3. A RIGHT LINE, or STRAIGHT LINE, is that which lies evenly between its extremities. *Fig. 1. Plate CLXV.*
4. A SUPERFICIES is that which has length and breadth; the extremities of a superficies are therefore lines, and the intersections of two superficies with one another are also lines.
5. A PLANE SUPERFICIES is that in which two points being taken, the straight line which lies wholly in that superficies.
6. A PLANE RECTILINEAL ANGLE is the inclination of two straight lines to one another, which meet together, but are not in the same line. *Fig. 2.*

Note. When several angles are formed at the same point, as at B, *Fig. 3.* Each angle is denoted by three letters, which express the whole angular point, and the other

GEOMETRY.

PLATE CLIV.

form the angle, thus, CBD or DBC denoting the angle contained by the line CB and DB. If a straight line standing on another makes the adjacent angles equal to each other, each of the angles is called a RIGHT angle, and the straight line which stands on the other is called a PERPENDICULAR. *Fig. 4.*

AN OBTUSE ANGLE is that which is greater than a right angle. *Fig. 5.*

AN ACUTE ANGLE is that which is less than a right angle. *Fig. 6.*

PARALLEL STRAIGHT LINES are such as lie in the same plane, and which being produced both ways do not meet. *Fig. 7.*

A FIGURE is that which is enclosed by one or more boundaries.

RECTILINEAL FIGURES are those which are bounded by straight lines.

A TRIANGLE is a rectilinear figure bounded by three straight lines. The three sides are called the sides, that side upon which the triangle is conceived to stand is called the base, and the opposite angular point the vertex.

EQUILATERAL TRIANGLE is that which has three equal sides. *Fig. 8.*

ISOSCELES TRIANGLE is that which has two equal sides. *Fig. 9.*

SCALENE TRIANGLE is that which has three unequal sides. *Fig. 10.*

A RIGHT ANGLED TRIANGLE is that which has one right angle. *Fig. 11.*

AN OBTUSE ANGLED TRIANGLE is that which has one obtuse angle. *Fig. 12.*

AN ACUTE ANGLED TRIANGLE is that which has three acute angles. *Fig. 13.*

A QUADRILATERAL is a rectilinear figure bounded by four straight lines. The two opposite angles are called the opposite angles, and the line which joins the opposite angles is called a diagonal.

A PARALLELOGRAM is a quadrilateral of which the opposite sides are parallel. *Fig. 14.*

A RECTANGLE is a parallelogram which has four right angles. *Fig. 15.*

A SQUARE is a parallelogram which has four equal sides and all its angles right. *Fig. 16.*

A RHOMBUS is a parallelogram which has four equal sides. *Fig. 17.*

A TRAPEZIUM is a quadrilateral which has two opposite sides parallel. *Fig. 18.*

A TRAPEZOID is a quadrilateral which has two opposite sides parallel. *Fig. 19.*

FIGURES bounded by more than four sides are called POLYGONS. *Fig. 20.*

A PENTAGON is a polygon of five sides, a HEXAGON six sides; a HEPTAGON seven; an OCTAGON eight; a NONAGON nine; a DECAGON ten; an UNDÉCAGON eleven; and a DODECAGON twelve sides.

A REGULAR POLYGON hath all its sides equal, and all its angles equal; if they are not equal, it is called an IRREGULAR POLYGON.

A CIRCLE is a plane figure bounded by one line, the circumference, which is such that all the lines drawn to it from a certain point called the centre are equal; and these lines are called the radii of the circle. The circumference itself is also often called a circle.

31. The DIAMETER of a circle is a straight line passing through the centre, and terminated both ways by the circumference.

32. An ARC of a circle is any part of its circumference. *Fig. 21.*

33. A CHORD is a straight line joining the extremities of an arc. *Fig. 22.*

34. A SEGMENT is any part of a circle bounded by an arc and its chord. *Fig. 23.*

35. A SEMICIRCLE is half the circle, or a segment cut off by a diameter. The half circumference is also sometimes called a semicircle. *Fig. 24.*

36. A SECTOR is any part of a circle which is bounded by an arc, and two radii drawn to its circumference. *Fig. 25.*

37. A QUADRANT, or quarter of a circle, is a sector having a quarter of a circle for its arc, and its two radii are perpendicular to each other. A quarter of the circumference is also called a quadrant. *Fig. 26.*

38. The HEIGHT or ALTITUDE of a figure is a perpendicular let fall from an angle or its vertex to the opposite side or base. *Fig. 27.*

39. In a right angled triangle the side opposite the right angle is called the HYPOTHENUSE, and the other two sides are called the LEGS, or sometimes the base and perpendicular. *Fig. 28.*

40. The circumference of every circle is supposed to be divided into 360 equal parts called DEGREES, and each degree into 60 MINUTES, each minute into 60 SECONDS, and so on. Hence a semicircle contains 180 degrees, and a quadrant 90 degrees.

41. The MEASURE of a RECTILINEAL ANGLE is an arc of any circle contained between the two lines which form that angle, the angular point being the centre, and it is estimated by the number of degrees in that arc. *Fig. 29.*

42. IDENTICAL FIGURES are such as have all the sides and all the angles of the one, respectively equal to all the sides and all the angles of the other, each to each, so that if the one figure were applied to, or laid upon the other, all the sides of the one would exactly fall upon and cover all the sides of the other, the two becoming as it were but one and the same figure.

43. The DISTANCE of a POINT from a LINE is the straight line drawn from that point perpendicular to, and terminating in that line.

44. An ANGLE in a SEGMENT of a CIRCLE is that which is contained by two lines drawn from any point in the arc of the segment to the extremities of that arc. *Fig. 30.*

45. An ANGLE on a SEGMENT, or an ARC, is that which is contained by two lines drawn from any point in the opposite, or supplemental part of the circumference, to the extremities of the arc, and containing the arc between them. *Fig. 31.*

46. An ANGLE at the CIRCUMFERENCE is that whose angular point is any where in the circumference, and an angle at the centre is that whose angular point is at the centre. *Fig. 32.*

47. A TANGENT to a CIRCLE is a straight line which meets the circle at one point, and every where else falls without it. *Fig. 33.*

48. A SECANT is a straight line that cuts the circle lying partly within and partly without it. *Fig. 34.*

49. A RIGHT LINED FIGURE is inscribed in a circle, or the circle circumscribes it when all the angular points of the figure are in the circumference of the circle. *Fig. 28.*

50. A RIGHT LINED FIGURE circumscribes a circle, or the circle is inscribed in it when all the sides of the figure touch the circumference of the circle. *Fig. 28.*

51. ONE RIGHT LINE FIGURE is inscribed in another, or the latter circumscribes the former when all the angular points of the former are placed in the sides of the latter. *Fig. 28.*

52. SIMILAR FIGURES are those that have all the angles of the one equal to all the angles of the other, each to each, and the sides about these angles proportional.

53. The PERIMETER of a FIGURE is the sum of all its sides taken together.

Note. When the word *line* occurs, without the addition of either *straight* or *curved*, a straight line is always meant; also the contractions (Def.) (Ax.) (Th.) are references to the definitions, axioms and theorems that have been before mentioned.

AXIOMS.

1. Things which are equal to the same thing are equal to one another.

2. When equals are added to equals, the wholes are equal.

3. When equals are taken from equals, the remainders are equal.

4. When equals are added to unequals, the wholes are unequal.

5. When equals are taken from unequals, the remainders are unequal.

6. Things which are doubles of the same thing are equal to one another.

7. Things which are halves of the same thing are equal.

8. The whole is equal to all its parts taken together.

9. Things which coincide, or fill the same space, are identical, or mutually equal in all their parts.

10. All right angles are equal to one another.

11. Angles that have equal measures, or arcs, are equal.

12. More than one straight line cannot be drawn from any given point to another given point. *Fig. 1.*

13. If two points D, F in a right line MN are situated at unequal distances DC, FE from another right line AB in the same plane; those two lines being indefinitely produced on the side of the least distance will meet one another. *Fig. 29.*

REMARKS. A PROPOSITION is something proposed to be done, and is either a Problem or Theorem.

A PROBLEM is something proposed to be done.

A THEOREM is something proposed to be demonstrated.

A LEMMA is something premised or demonstrated, in order to make what follows the more easy.

A COROLLARY is a consequent truth gained immediately from some preceding truth or demonstration.

A SCHOLIUM is a remark or observation made upon something going before.

THEOREM I. *fig. 30.* If two triangles have two

sides and the included angle of the two triangles will be identical, or equal.

In the two triangles ABC, DEF, of the one be equal to the side DE and the side AC equal to DF, also equal to the angle D, the triangles are equal, or equal in all respects. For triangle ABC, to be applied to, or the triangle DEF, so that the point A coincide with D, and the side AB with DE, then since the angles A and D are equal, AC shall also coincide with DF, or equal to DE, and AC is equal to DF; B and E shall coincide, as also the F; consequently the side BC will be the side EF; (Ax. 12.) therefore the triangles are identical (Ax. 9.) and have their corresponding parts equal.

THEOR. II. *fig. 30.* Triangles having two angles and the side which lies between them are identical, or have their other sides equal.

Let the two triangles ABC, DEF, have the angle B equal to the angle E, the angle C equal to the angle F, and the side BC equal to EF, then these triangles will be identical.

For conceive the triangle ABC applied to the triangle DEF, so that BC may fall exactly upon EF, since the angle B is equal to the angle E, BA will fall upon DE, and in like manner the angles C and F, are equal, the side AC will fall upon FD, thus the triangles will be identical and therefore (Ax. 9.) are identical.

THEOR. III. *fig. 31.* In an isosceles triangle the angles at the base are equal.

If the triangle ABC be isosceles, AB equal to a side AC; then will the angle at B be equal to the angle at C. For draw a line AD, bisecting the angle at A to be bisected, or dividing the angle into two equal parts by the line AD. The triangles BAD, CAD having two sides an angle of the one equal to two sides and the included angle of the other, namely AB, AD common to both, BAD equal to the angle CAD, are identical (Th. 1.) therefore the angle B is equal to the angle C.

COROLLARY 1. An equilateral triangle is equiangular.

COR. 2. A line that bisects the vertex angle of an isosceles triangle bisects also the base and is perpendicular to it.

THEOR. IV. *fig. 31.* If a triangle has its angles equal, the sides which subtend these angles are also equal.

Let ABC be a triangle, of which the angles B and C are equal, the side AB will be equal to the side AC. Suppose BC to be produced, and AD joined, dividing the triangle into the two triangles BAD, CAD; and the angle ABD to be turned over, so that it may fall upon DC, then the point B will coincide with the point C, and since the angles B and C are equal, the side AB will fall upon AC, and the extremity C will coincide with the extremity C because DC is common to both; the side AC is equal to the side BC.

hence every equiangular triangle is also

V. fig. 32. Triangles which have sides mutually equal, are identical, or their three angles equal each to each.

Triangles ABC, ADC have their 3 sides equal, viz. AC equal to AC, AB equal to AD and BC equal to DC, the angles opposite these shall be equal, namely BAC to DAC, CA, and ABC to ADC. Suppose the lines are joined by their longest equal sides, and then the angle ABD is equal to ADB, the angle CBD to the angle CDB (Th. 3.) the whole angle ABC is equal to the whole angle ADC (Ax. 2.) and since AB is equal to AD and BC to DC, the triangles ABC, ADC are equal (Th. 1.)

VI. fig. 33. The angles which one line makes with another upon one side of it are equal to two right angles.

If the line AB make with CD upon one side angles ABD, ABC, these are together equal to two right angles. If AB be perpendicular to CD, the angles ABC, ABD are evidently each equal to a right angle (def. 7.) But if AB be not perpendicular to CD, draw BE perpendicular to CD, dividing the greater angle ABC into the angles EBC, EBA, then the former EBC is equal to a right angle, and the remaining part EBA with the whole lesser angle ABD equal to a right angle, the whole of both the angles must necessarily be equal to two right angles. (Ax. 2.)

Hence also, conversely, if the two angles ABD on both sides of line AB make equal to two right angles then CB and BD form a straight line.

All the angles that can be made round a point by any number of lines are equal to two right angles.

VII. fig. 34. If two lines intersect each other, the opposite angles are equal.

If AB and CD intersect each other in E, the angle AEC is equal to BED, and AED to BEC; the angles AEC, AED are together equal to two right angles (Th. 6.) and in like manner BED, BEC are together equal to two right angles; therefore the angles AED are together equal to BED, (Th. 1.) and taking away the common angle AED from both, there remains AEC equal to BEC. (Th. 3.) In like manner it will appear that AED is equal to BEC.

VIII. fig. 35. Two straight lines perpendicular to one and the same straight line are parallel to each other.

Let AB and CD be perpendicular to EF, the lines AB and CD are parallel. For if they be not parallel they will meet at some point, as G, take EH perpendicular to EF, and join FH. The triangles EHF, EHG have EH equal to EH and EF common to both, and also the angles FEH, FEG equal in all respects, (Th. 1.) and so the triangles EHF, EHG being both right angles, the triangles are equal, as well as HEG, must be one continuous line; (Th. 6. Cor. 1.) which is therefore AB and CD are parallel.

IX. fig. 36. If two straight lines be perpendicular to the one terminated

by the other, are equal, and are also perpendicular to both the parallels.

Let AB and CD be parallel straight lines, and let EF, GH, be perpendiculars to CD one of them at E and C, meet the other at F and H; the lines EF and GH are equal between themselves, and also perpendicular to CD. It is evident that EF and GH are equal, for if they were not equal, AB would not be parallel to CD. (Ax. 13.) The line EF must also be perpendicular to CD, for if it be not, then draw FM perpendicular to FE, meeting GH in M; so shall FM be parallel to AB (Th. 8.) and therefore GM equal to EF, or to GH, which is impossible; therefore EF is perpendicular to CD, and by the same argument GH is perpendicular to CD.

THEOR. X. fig. 37. If a line intersect two parallel lines, it makes the alternate angles equal.

Let the line EF intersect the parallel lines AB, CD at G and H, the alternate angles AGH, GHD are equal. Let HK, GL be perpendicular to the parallel lines AB, CD, then these lines HK, GL are also parallel, (Th. 8.) now the triangles HKG, HGL having the side HK equal to GL and KG equal to HL (Th. 9.) also the angles at K and L equal, they being right angles, will have the angles KGH, LHG equal. (Th. 1.)

COR. If a line intersect two parallel lines it makes the exterior angle equal to the interior and opposite on the same side, and also the two interior angles on the same side equal to two right angles. For the interior angle GHD is equal to AGH, that is, (Th. 7.) to the exterior angle EGB, to each of these add BGH, and the two interior angles BGH, GHD are together equal to BGH, BGE, that is to two right angles. (Th. 6.)

THEOR. XI. fig. 38. If a line intersecting two other lines makes the alternate angles equal, these lines are parallel.

Let EF intersect the lines AB, CD at G and H, and make the alternate angles AGH, GHD equal, the lines AB, CD are parallel. For if AB or AG be not parallel to CD, suppose KG parallel to CD, then the angle KGH will be equal to GHD, (Th. 10.) that is by hypothesis to AGH which is impossible, (Ax. 8.) therefore no other line than AB can be parallel to CD.

COR. If a line intersecting two other lines makes the exterior angle equal to the interior angle on the same side, or the two interior angles on the same side equal to two right angles, these lines are parallel.

THEOR. XII. fig. 39. If one side of a triangle be produced, the exterior angle is equal to both the interior and opposite angles, and the three interior angles are equal to two right angles.

Let BC a side of the triangle ABC be produced to D, the exterior angle ACD is equal to the two interior and opposite angles BAC, ABC, and the three interior angles ABC, BAC, BCA are equal to two right angles. Let CE be parallel to AB, then the angle ACE is equal CAB (Th. 10.) and the angle ABC to ECD, (Th. 10, Cor.) therefore the angle ACD is equal to the two angles CAB, CBA, to each of these equals add ACB, thus the angles ACB, ACD are equal to the three angles ABC, CBA, BAC, but ACB, ACD are equal to

two right angles (Th. 6.) therefore the three angles of the triangle are equal to two right angles.

COR. 1. The exterior angle of a triangle is greater than either of the interior opposite angles.

COR. 2. Any two angles of a triangle are together less than two right angles.

COR. 3. If two triangles have two angles of the one equal to two angles of the other, the remaining angle of the one is equal to the remaining angle of the other.

COR. 4. The two acute angles of a right angled triangle are together equal to a right angle.

THEOR. XIII. *fig. 40.* The greatest side of every triangle subtends the greatest angle.

Let ABC be a triangle of which the side AB is greater than AC, the angle ACB is greater than ABC. Take AD equal to AC and join DC, then the angle ACD is equal to ADC (Th. 3.), but ADC is greater than ABC (Th. 12. Cor. 1.) therefore ACD is greater than ABC, much more then is ACB greater than ABC.

COR. The greatest angle of every triangle is subtended by the greatest side.

THEOR. XIV. *fig. 41.* The opposite sides and opposite angles of a parallelogram are equal, and the diagonal divides the parallelogram into two equal parts.

Let ABCD be a parallelogram, AB is equal to CD, and AC to BD, also the angle CAB is equal to CDB, and ACD to ADB, and the triangle ACD is equal to ABD. For since AB is parallel to CD (def. 21.) the angles BAD, CDA are equal (Th. 10.) and since AC is parallel to BD, for the same reason, the angles CAD, BDA are equal, now AD is common to the triangles ABD, ACD therefore these triangles are identical, (Th. 2.) hence AB is equal to CD, AC to BD, the angle ACD to ABD, the angle CAD to ADB, and BAD to ADC, and consequently the whole angle CAB to the whole angle CDB.

THEOR. XV. *fig. 41.* The lines which join the extremities of equal and parallel lines towards the same parts are themselves equal and parallel.

Let AB be equal and parallel to CD, then AC and BD which join their extremities towards the same parts are also equal and parallel. Join AD, then the angles BAD, CDA are equal, (Th. 10.) and since AB is equal to CD and AD common to the triangles ABD, ACD, these triangles are equal in all respects (Th. 1.), therefore AC is equal to BD, and the angle CAD to ADB, hence AC is also parallel to BD. (Th. 11.)

THEOR. XVI. *fig. 42.* Parallelograms standing upon the same base and between the same parallels are equal.

Let ABCD, EBCF be parallelograms standing on the same base BC, and between the same parallels BC, AF, they are equal to one another. For since AD is equal to BC, that is to EF, (Th. 14.) therefore AE is equal to DF, now AB is equal to DC (Th. 14.) and the angle BAE to CDF, (Th. 10. Cor.) therefore the triangles BAE and CDF are equal. (Th. 1.) Now if from the whole figure BAFC there be taken away the angle CDF, there remains the parallelogram ABCD, and if from the same figure there be taken away the equal triangle BAE, there re-

mains the parallelogram EBCF, therefore parallelograms are equal to one another.

COR. 1. Hence triangles standing on the same base and between the same parallels are equal to one another.

For let BAC, BEC be two triangles on the same base BC and between the same parallels BC, AF, it is evident that they are the same as the parallelograms BADC, BEFC, and are equal.

COR. 2. Hence if a triangle and a parallelogram stand on the same base, the triangle is equal to half the parallelogram.

COR. 3. Therefore all parallelograms whatever whose bases and altitude are also equal among themselves.

THEOR. XVII. *fig. 43.* The complements of a parallelogram are equal.

Let BD the diagonal of a parallelogram ABCD be drawn, and let HK, EG parallels to the sides intersect each other at F a point in the diagonal, the whole parallelogram is thus divided into four parallelograms; two of these, viz. EK, FK are about the diameter, and the remaining two, viz. GK, FD are called the complements, and are proved equal. The whole triangle DKB is equal to the whole triangle DCB, (Th. 12.) for the same reason the parts DEF, FKB are respectively equal to the parts DKF, FKB, therefore the remaining parts HE, CK, are equal.

THEOR. XVIII. *fig. 44.* In a right angled triangle the square of the hypotenuse is equal to the sum of the squares upon the other two sides.

Let AD be a square upon the hypotenuse of a right angled triangle ABC and BG, a square upon its side AB, and BG, a square upon its side AC, AD is equal to the sum of BG and CG. Let MBH be parallel to AE produced in H, and let EA, produced in N. If from the equal angles CAB, angle NAB, common to both, be taken away the angle BAC, there remains NAG, equal to BAC, and the side AN is equal to BA, and the side AG is equal to AC, and the side AN is equal to AC (Th. 16.) and therefore the parallelograms AM, AN are equal (Th. 16. Cor. 3.) but AH is equal to BG (Th. 16.) therefore AM is equal to BG, in the same way it will appear that AN is equal to CG, therefore the whole AD is equal to the sum of the squares BG and CG.

THEOR. XIX. *fig. 45.* A perpendicular line drawn from the centre of a circle to a chord bisects the chord.

Let CD be drawn from the centre C perpendicular to AB a chord in the circle, AD, DB. Join CA, CB. Because AC is equal to BC (def. 3.) the angles CAB, CBA are equal, now ADC, BDC are equal, being in all respects equal, therefore the angles ACD, BCD are equal (Th. 12. Cor. 3.) therefore the triangles ADC, BDC are in all respects equal, (Th. 1.) and consequently AD equal to DB.

COR. A perpendicular bisecting a chord of a circle passes through the centre of the circle.

THEOR. XX. *fig. 46.* A straight line drawn through any point in the circumference of a circle, and perpendicular to the radius drawn to that point, is a tangent to the circle.

right angles to the radius terminating in \cdot , is a tangent to the circle.

be perpendicular to the radius AC, the a tangent to the circle at the point A, any line from the centre cutting the \cdot , and the line AB at E. Because \angle CAB angle, \angle CEA is less than a right angle, therefore CE is greater than CA, or, (Th. 13.) therefore the point E is without the circle, and the same may be shown of \cdot in AB, except A, therefore AB is a tangent to the circle. (def. 47.)

If a line be perpendicular to a tangent at its point of contact, that line passes through the

. XXI. fig. 47. An angle at the centre is double the angle at the circumference subtending upon the same arch.

B be the angle at the centre of a circle and angle at the circumference, the angle double ADB. Join DC which produce to angle ACE is equal to both the angles \angle CA, (Th. 12.) that is, since CD and equal to twice CAD; (Th. 4.) in like manner will appear that BCE is equal to twice CAD, therefore the whole angle ACB is double

All angles in the same segment of a circle are equal to each other.

In the same circle, or in circles of equal radii, if two angles at the circumference subtend equal arches, they are equal to one another and conversely.

. XXII. fig. 48. An angle in a semicircle is a right angle.

B be an angle in a semicircle, draw the chord DE. The angle ACE at the circumference is half of ADE at the centre, and in like manner CE is half of BDE; (Th. 21.) therefore angle ACB is half the sum of the angles \angle EDB, or is equal to a right angle.

. XXIII. fig. 49. The sum of any two opposite angles of a quadrilateral inscribed in a circle is equal to two right angles.

CD be a quadrilateral in a circle, the angles \angle D, BCD, also the sum of \angle ADC, \angle ABC, is equal to two right angles. Join AC, BD. \angle BAC is equal to \angle BDC, also the angle \angle DAC is equal to \angle DBC (Th. 21. cor. 1.), therefore angle DAB is equal to the two angles \angle BAC and \angle DAC; and the sum of \angle DAB and \angle DCB is equal to three angles BDC, DBC and DCB, that is, equal to two right angles. (Th. 12.)

. XXIV. fig. 50. The angle formed by a tangent to a circle, and a chord drawn to the point of contact, is equal to the angle in the alternate segment of the circle.

be a tangent, and AC a chord, the angle \angle CEA is equal to any angle CEA in the alternate segment. Draw AF perpendicular to AB, \angle CEA is equal to \angle CEA in the alternate segment of the circle (Th. 20 Cor.) \angle CEA is a right angle (Th. 21.), and therefore \angle CEA, but FEC, FAC, parts of these angles, therefore the remainders CEA, FAC, are equal.

PART I.

SECT. II. OF RATIOS and PROPORTIONS.

In treating of proportion, the Algebraic notation is here adopted for the sake of brevity; it will therefore be proper to observe,

1. That the letters A, B, &c. are used to denote quantities of any kind, and the letters $m, p, q, \&c.$ to denote numbers only.
